ECONOMIC AFFAIRS

SELECTED ARTICLES ON REFORM OF ECONOMIC SYSTEM, ENTERPRISE MANAGEMENT

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

1. Introduction: A Five-Year Retrospective [pp 1-10]

[Text] This collection includes the principal articles I wrote during the 5 years between 1979 and 1983, 31 articles in all. Most of these articles were published in newspapers and periodicals while the rest are unpublished lectures, reports, etc. These articles were published at different times so the wording and expressions may not be exactly the same in earlier and later articles. When publishing a collection of esays, I believe that one should basically preserve the original articles; thus in most of the articles only the necessary corrections have been made along with certain revisions in specific articles.

As far as I am concerned, the publication of such a collection has significance in that I may make use of this opportunity to look back on the course I have taken over the past 5 years in ideology and in work. However, does it have any significance for the reader? I believe it may be of some use. The past 5 years has been a period of major historical change, and current reforms have become the key points in national economic work. My essays deal primarily with the reform of the economic system and enterprise management. Although this is only "the opinion of one school of thought," it speaks to a lesser or greater extent to several major issues in China's reform. It may provide readers who are concerned with these issues some material to ponder and explore. By offering some of my ideas, others may be inspired to probe further.

In order to compile this collection it was necessary to review the articles I had written and the talks I had given over the past several years. Naturally, this was very exciting as it brought to mind the various experiences related to each article. Most of all, I rejoice over being part of this great new historical period of our party and state during my later years.

What is man's greatest happiness? I believe the greatest happiness is being able to be part of the turbulent and surging current of history. Regardless of the extent of man's abilities, if he can become a drop of water in the advancing tide, that is happiness. No man's words and actions can be correct all the time, yet if he lives in a time that encourages him to dare to think, speak, and act, that is happiness.

The 3d Plenum of the 11th CPC Central Committee ushered in a new era in our party and nation of liberating ideology, seeking truth from facts, stability, unity, and vitality. Without such unprecedented historical conditions I would not have been able to write these articles, much less publish so many of them. I have written essays in the past, but they were regarded as no more than the opinions of an intellectual. At that time it seemed that in real life there was no need for theoretical work, that theoretical workers were usually unprepared to truly participate in reality. Essays were like a goose feather thrown into the mighty current of life, as not even half a drop of water splashed back up. If one was not successful he incurred fabricated charges and sudden misfortune. I, like numerous intellectuals, personally endured such adversity. The situation today is completely different. The party and the state stress developing the role of intellectuals and urge theoretical workers to confront and serve reality. Even if one's views are insignificant and limited, they may play some role in reality; they are all welcomed and encouraged by the party and the people. At present, theoretical workers no longer lack an arena for displaying their abilities; on the contrary, theoretical workers are needed to study and investigate the large number of real problems we are confronted with. Indeed, there is much theoretical work to be done.

Since the 3d Plenum of the 11th CPC Central Committee a gratifying phenomenon has occurred under the guidance of the ideological line of liberating ideology and seeking truth from facts: the true implementation of the party's policy of letting a hundred flowers bloom and a hundred schools of thought contend. This is a significant sign that the nation and people are heading toward a period of full bloom.

I am a "late blooming" theoretical worker. My theoretical foundation was shaky and practical experience lacking. Nevertheless, due to the objective requirements of my work, I published some immature ideas over the past 5 years concerning systems reform and enterprise management. What makes me feel excited is that these ideas have evoked repercussions of all kinds. Some proposals have won the support of the Central Committee or local leading comrades, and I have had the opportunity to acquire some practical experience. some theses provoked great argument. As far as an author is concerned, approval or opposition are both inspiring and constructive.

To enable the reader to better analyze and approach the ideas in my essays, I must explain some controversial matters. To be sure, these explanations are based upon my own understanding, so I dare not claim that they are objective comments.

Of the 31 articles included in this collection, nearly half are controversial. Of these, the article "Enterprises as Basic Units" concerning the two levels in distribution according to work, the Chinese method of enterprise management, and the enterprise leadership system evoked the greatest reactions. Below I will give a simple explanation of these problems and of controversies over other articles.

The first draft of the article "Enterprises as Basic Units" was written during the first half of 1979. As internal material, it was sent for review to leading comrades of the Central Committee and to relevant departments. At that time systemic reform was being discussed and there was much argument over how to proceed with urban reforms. I felt that it was necessary to begin by first defining the nature and position of socialist enterprises and clarifying the relationship between the state and enterprises, and then use this as the criterion for mapping out the entire macroscopic management system. In order to explain this concept I tried to provide theoretical proofs. I proposed the idea of enterprises as economic cells and the notion that enterprises are independent commodity producers. I divided the economic system into three models, the theory of the state as the basic unit, the theory of the region as the basic unit, and the theory of the enterprise as the basic unit. I advocated adopting the latter for carrying out reforms. This article solicited internal opinions and won the acceptance of several leading comrades. Later, the article "My Views Concerning the Theory of Enterprises as the Basic Unit" was published in the monthly JINGJI GUANLI [ECONOMIC MANAGEMENT]. After revision and additions, "Enterprises as Basic Units" was published in the first issue of ZHONGGUO SHEHUI KEXUE [SOCIAL SCIENCES IN CHINA], stimulating a variety of reactions. Some approved and others did not, and this has continued to the present.

Whereas the majority of enterprise workers approved of this article, certain comrades in economic agencies and in theoretical circles took exception. Some felt that "Enterprises as Basic Units" advocated in a biased manner reviving the microeconomy while overlooking macroscopic control. Some argued that since one cannot call a socialist economy a commodity economy, neither can enterprises act as commodity producers. Others believed that in state-owned enterprises the means of production are owned by all the people and that therefore we cannot implement the practice of assuming responsibility for profits and losses, while still others interpreted my words too literally. Because I used the two characters "benwei" [2609 0143] for departmentalism, they felt that "Enterprises as Basic Units" encouraged departmentalism in enterprises. Except for making oral replies at some meetings, I have written no articles rebutting these objections. I believe that only comrades who have earnestly read this article can see that "Enterprises as Basic Units" proves simply that in the reform of an industrial and commercial system it is necessary to design a macroscopic management system using the form of the enterprise as the criterion, and under no circumstances should we neglect macroscopic control. The use of "benwei" is like adopting the gold or silver standard in currency; it is not the same as the meaning of the characters in the word for departmentalism. Even if they were the same, favoring a basic unit is not equivalent to promoting departmentalism, just as our emphasis on experience does not mean that we advocate empiricism. As for whether a socialist economy is a commodity economy, this has been a matter of great contention in theoretical circles for many years. Nevertheless, at the very least everyone acknowledges that commodity production and commodity exchange still exist and that they must be developed. Since commodity production does exist, how can there not be commodity producers? And whether state-owned enterprises should assume responsibility for profits and losses is a problem that can be explored further. At any rate, the matter of responsibility for profits and losses has gradually become clearer.

In the past few years the application of reforms has shown that there is still a multitude of reforms to be made in the economic system. We must first solve the problems of the form of economic cells. Complete successes have been obtained in rural reforms and an effort has been made to first correctly resolve the problem of the form of economic cells. Rural areas have implemented the output-related system of contracted responsibility. Essentially, they proceeded from China's rural production forces to create a new rural economy with the rural household as the basic unit. One may call this a case of "rural households as the basic unit." Over the past few years many experiments have been tried in urban reforms from expanding enterprise autonomy to broadly establishing the economic responsibility system in industry to further expanding enterprise autonomy and to simplifying administration, expanding rights and transferring them. In the final analysis, the problem still remains of determining the nature and position of enterprises.

In 1980 I published "Several Questions Concerning Distribution According to Work" in GONGREN RIBAO [WORKERS DAILY]; that same year I also published in GONGREN RIBAO "A Tentative Discussion of the Principle of Comprehensive Material Benefits." In these two articles I proposed the concept of "the two levels in distribution according to work." I believe that in implementing distribution according to work, it is not possible to simply apply Marx's classicial exposition in practice. That is, society cannot directly institute distribution to individual producers according to labor. Society must first carry out distribution for the labor contributions of enterprise collectives, and only then implement distribution by enterprises to staff and workers on the basis of work. In the article "A Tentative Discussion of the Principle of Comprehensive Material Benefits," I made some recommendations for reforming the wage system. XINHUA reprinted an abstract of this article, which provoked a great reaction throughout the country. I received over 1,000 letters from readers throughout China, most of which expressed support for my ideas concerning reform of the wage system. The concept of the two levels in distribution according to work evoked some controversy in theoretical circles. The matter of the two levels in distribution according to work grew to include inquiry into distribution of national revenue and redistribution and an examination of the relationship between wages and costs, etc. Then the western section of the city of Chengdu tested the "method of subtracting capital and sharing," which is considered an application of the concept of two levels in distribution according to work. It too evoked great controversy. This controversy has continued to the present.

In the above mentioned two articles, due to limitations of space, I have not carried out further theoretical discussions. Regarding Marx's exposition on distribution according to work in his "Critique of the Gotha Program" I stressed that in socialized, large-scale production enterprises it is not possible for individual labor to make a direct contribution to society; it can only provide society with products [chanpin 3934 0756] manufactured by enterprise collectives. In reality, the fundamental problem still lies in the fact that Marx at that time believed that by establishing a socialist society it would be possible to eliminate commodities [shangpin 0794 0756]. An individual's labor would become a direct part of social labor. However, in current reality we are still practicing commodity production. It is not possible for an individual's labor to become a direct part of social labor. We can only use the average socially necessary labor that goes into manufacturing commodities to measure labor contribution to society. Consequently, distribution according to work must be divided into two levels or two administrative levels in order to be carried out. In this collection I have made the above mentioned revisions and additions to "Several Questions Concerning Distribution According to Work."

The two problems of eating out of "one big pot" are fundamental problems that must be resolved through systemic reform. The two levels in distribution according to work were proposed precisely to deal with the two problems of eating out of "one big pot." If enterprises practice distribution according to work, that will solve the problems among enterprises of eating out of "one big pot," and if enterprises carry out distribution to workers on the basis of work, that will solve the problem among workers of eating out of "one big pot." There are those who believe that the problem among enterprises is exchange of equal value, not distribution. Actually, this is not so. Capitalist enterprises use exchange of equal value, including equal value exchange of labor power, to realize capitalist distribution. After socialist enterprises undergo exchange of equal value, their net revenue must still be distributed between the state and enterprises. The size of the portion retained by enterprises which is transformed into consumption funds, for individual workers and collectives is a matter of distribution. The total amount of the consumption fund should embody the principle of greater profits for more work and fewer profits for less work. This is society's distribution to enterprise collectives on the basis of labor. The amount of enterprise-retained profits applied to production development funds is the redistribution of the portion accumulated by the state. Naturally, this does not fall under the category of distribution according to work. The concept of two levels in distribution according to work proceeds from this objective reality and I have therefore proposed the matter of reconsidering Marx's classical exposition.

The other implication of the concept of the two levels in distribution according to work involves the problem of the wage control system (including bonuses). Since the state has acknowledged the two levels in distribution according to work, the state need only be concerned with distribution to enterprise collectives, that is, controlling the total amount of enterprise consumption funds according to the principle of distribution according to work. The top must not be closed off and the bottom must not be kept low. Enterprises may determine how to implement distribution on the basis of labor within enterprises. This principle of two levels in distribution has already been accepted.

While carrying out reforms these past few years, there has been great controversy concerning the problem of the enterprise leadership system. I appreciate the spirit of relevant directives of central government leaders. I wrote the article "On the Leadership System of Socialist Enterprises" in which I proposed the concept of "separation of powers" in enterprises. I believe that enterprise party committees play a major supervisory role in enterprise administration. This discussion aroused much criticism; some comrades felt that this would weaken the party's leadership of enterprises. The matter of the enterprise leadership system has continued to be examined over the past few years. Some enterprises have carried out reform experiments. They have tried out the factory manager responsibility system under the leadership of the congress of delegates of staff and workers and have been successful. At present everyone's views are gradually becoming more similar and they have affirmed the direction of carrying out the factory manager responsibility system. There have also been new developments in my own understanding of this problem. I am preparing to write an article on "A Reexamination of the Leadership System in Socialist Enterprises." The basic concepts, however, remain the same.

In 1979 a debate was launched on the correct way to study and promote the experiences of foreign countries in comprehensive quality control. The scope of influence was quite broad. Some comrades had the mistaken understanding that I oppose comprehensive quality control. Actually, I was one of a group which was first to participate in promoting comprehensive quality control. What I did oppose was indiscriminately copying the experiences of foreign countries. I advocated establishing a control science that embodied Chinese characteristics and, to this end, I published some lectures and articles. Afterward, responsible comrades in the State Economic Commission summed up studying the experiences of foreign countries in a 16-character policy: "Give priority to China, choose their numerous strong points, combine and refine them, and develop our own unique style." I wholeheartedly agree with this approach.

After studying foreign experiences in comprehensive quality control, in 1979 comrades in the Shanghai Diesel Engine Factory proposed the concept of "comprehensive economic accounting." When I was in Shanghai investigating and studying I was inspired by this idea and suggested using the "three comprehensives" (comprehensive planning management, comprehensive quality control, comprehensive economic accounting) as the conceptual basis for China's enterprise management system. I discussed this in the article "Basic Characteristics of Managing Socialist Enterprises." There were then further developments giving rise to the concept of "one system and four comprehensives," that is, a democratic and centralized leadership system, and comprehensive planning management, comprehensive technical and quality control, comprehensive economic accounting, and comprehensive control of personnel and labor. Whether or not a Chinese-style enterprise management system could use the model of "one system and four comprehensives" also provoked widespread discussion. Nevertheless, numerous enterprises throughout China approved of this and achieved real successes in practice. Of course, further investigation in carrying this out is necessary, but a large step has already been taken toward a Chinese-style enterprise management system. With this kind of beginning the future will surely yield excellent results. Moreover, with sustained and abundant development a socialist Chinese school of thought will form in the international tribune of opinion on management.

I have mentioned several problems that have created much controversy. Other articles also discuss numerous theoretical or practical controversies. For example, "Daring To Take the First Step in Reforming the System" once provoked national debate on how to evaluate Sichuan's experiences in reform. During reform the Capital Iron and Steel Co. tried out the contract for increased profit delivery which also evoked tremendous debate. The problem of industrial reorganization and enterprise consolidation has not yet been rationally resolved and to this day remains a controversy.

Under the guidance of the party Central Committee's eight-point policy of "readjusting, restructuring, consolidating, and improving" there have been great developments in the national economic situation. In his report to the Second Session of the Sixth NPC, Comrade Zhao Ziyang stressed the problem of urban reform. I believe that if we regard the past few years as the focal period of readjustment, we are now beginning to shift to a focal period of reform, wherein the critical area will be urban reform. Urban reform is much more complicated than rural reform. Numerous problems await further theoretical investigation and further practical exploration. I personally believe that urban reforms must first of all regard the enterprise as the basic unit and clarify the form of this economic cell as well as the relationship between the state and enterprises. It is necessary to use this as the criterion for designing a comprehensive macroeconomic management system.

The overall national economy is an organism with organic connections. Clarifying the form of the economic cell is only the beginning, the basis for reform. On this foundation, it is necessary to resolve the problem of cross connections among cells. This involves the problems of reorganizing industry and commerce and consolidating enterprises as well as developing the role of key cities, etc. It is also necessary to resolve the problems of the state's vertical management and organization of economic activities from the central government to localities. The current proposal to "simplify administration and expand rights" was suggested precisely to study and resolve the problems of vertical relations. In my article "The Essence of the Reform of the Economic Management System Is To Bring About a Socialist Economic Democracy" I presented several views on vertical management. The concrete methods mentioned may not all be appropriate but I believe that the rational approach is to establish a vertical management organization based on the principle of democratic centralism.

The policy direction of the party and the state is to revive the domestic economy and open up to foreign trade. The latter involves the problems of how to correctly handle foreign relations and howto handle economic relations between socialist and capitalist countries. The solution to all these problems must comply with the principle of liberating ideology and seeking truth from facts. We must conduct theoretical and practical investigations and proceed along the path of Chinese-style socialism.

As a theoretical worker, today I am confronted with a wonderful situation. I feel both excited and ashamed that my own abilities and knowledge are inadequate. By publishing a collection of my major articles of the past 5 years, in addition to hoping to inspire others, I hope to receive the criticism and correction of comrades in theoretical circles and in practical work so that I become better able to do what I can to promote reform.

Jiang Yiwei
Beijing, 1 July 1984

2. Planning and Control [pp 59-66]

[Text] [Editor's note] The author delivered this essay at the theoretical symposium held 8 April 1982 by the CPC Central Committee Ministry of Propaganda. [End of editor's note]

I. It Is Necessary To Maintain a Socialist Planned Economy

The issue of planning and the market is one of the major problems being enthusiastically discussed in theoretical circles today. It is also a major practical problem that must be resolved in order to implement the policy of readjusting, restructuring, consolidating, and improving.

According to Marxist theory, when carrying out socialist revolution and construction, there are many aspects to the historical tasks that must be fulfilled. One of the basic links is to bring about public ownership of the means of production. Only on the basis of public ownership is it possible to establish a unified socialist economy, to develop production and meet demands in a planned and proportionate manner and to overcome that crisis and great waste produced by the state of anarchy in social production under capitalism. Thus, a socialist economy must undertake economic planning; this is a fundamental, unchanging principle.

The question at present is how are we to understand a planned economy? How specifically should it be implemented so as to be advantageous to developing production?

Marxism has not really provided us with a specific model of a planned economy. A rational planned economy can only come about by constantly reviewing the experiences of real life. China has had both experiences and lessons in implementing a planned economy. When we affirm experiences we cannot only affirm past models. When we sum up lessons we have learned, we cannot therefore deny this fundamental principle in implementing a planned economy. The tasks confronting us are: first, we must uphold socialism and implement the principle of a planned economy; and second, se must sum up experiences and lessons, undertake a thoroughgoing inquiry into a planned economy, ranging from concepts to concrete methods, and seek a specific form that suits the development needs of China's production forces and that will facilitate continued development.

II. We Must Clarify Several Conceptual Matters in the Area of Theory

During theoretical inquiry one frequently encounters unclear ideas. People's understanding of the meaning of what is said varies and, as a result, there may be much argument. Each person discusses his interpretation, or they misunderstand each other or they talk about different things entirely.

We must not rely solely upon a few words of leaders in the central government as the basis for studying theoretical problems. We must be skilled in understanding the spiritual essence and basic guiding thought of speeches given by our leaders in the central government. We cannot ask our leaders to be so exact and precise in their use of words and thus cannot simply mechanically apply certain expressions from their speeches. On the contrary, theoretical workers are responsible for adopting a scientific attitude and for using precise concepts to logically elaborate on the principles and rules set forth by the central government. This is the proper attitude to take regarding the party and the manifestation of the proper party spirit among theoretical workers.

I feel that there are many unclear concepts regarding the issue of economic planning. Many years of practical life have given rise to concepts derived from experience. When we try to change reality, these habitual concepts often impede our inquiry into the true nature of things. For instance, our planning management follows the Soviet practice of adopting directive planning to control the activities of economic units. For this reason, the very word "plan" implies directive plans. Thus, directive planning seems to be equivalent to a "planned economy." The mention of the word "market" implies "free market," but because a free market is not included within the sphere of directive planning it is not a part of planning and not a part of a planned economy. It is worth discussing whether this kind of conceptual system formed from customary ways of looking at things is theoretically scientific and what contradictions exist in practice.

Based on my own limited understanding, China's public ownership economy already occupies a dominant position. The entire social economy should be a socialist unified economy. To implement planning management is also to implement a planned economy. The entire socialist economy should be included in the planned economy.

Some people may argue that since the economic activities of the whole country are so complex, how can they all come under planning? This touches upon the conceptual matter of what exactly is planning. If planning is equivalent to directive planning, naturally it is not possible to include all production and circulation as well as the particulars of variety and specifications in planning. The literal meaning of planning has to do with people's predictions, assumptions, and overall planning regarding objective activities. Its meaning may be general or specific.

To implement a planned economy is to practice planning management of economic activities throughout the country, including market regulation. However, the extent and methods of management vary. For instance, if we stipulate which commodities may be freely regulated by the market, this stipulation itself is an act of planning management. This involves the conceptual question of what is planning management.

There are primarily two functions of planning management: one is to formulate plans and the other is to exercise control of economic activities to achieve planning objectives. Planning management, planning, and control are three different concepts. Planning plus control results in planning management. Planning is the prediction and demand for objective economic activities.

Control is the realization of planning objectives and the regulatory measures used for objective activities.

Planning should be comprehensive but the term planning includes both general and specific planning. There may be differing methods of control, but they can be roughly divided into two methods: direct control and indirect control. Take control of production for example. The state may adopt direct methods of control--such as issuing directives--for major commodities that affect the national policy for the people's livelihood. Even though production will be directly controlled and this will be reflected in planning, it is of course still necessary to make more detailed provisions. The production of other goods cannot be ignored, so planning provisions for these goods may either be left rather general, or specific amounts of increase or decrease may be stipulated. It is not that the production of these goods is uncontrolled, but that indirect methods of control are used, that is, economic levers are primarily applied as a means of control so that production remains consistent with the objectives of planning predictions as much as is possible. To be sure, this does not mean that because indirect control utilizes economic levers, direct control totally disregards economic regulatory measures. Direct control must also make use of the law of value to motivate initiative for fulfilling directive tasks.

We must not regard the market as only a free market. In a planned economy under socialism the state directly controls the production of some primary goods and, at the same time, controls their circulation and distribution. One may say that the circulation of these goods constitutes a "market." It is reasonable for Comrade Chen Yun to call this part of the market the "state market." This means that this market is controlled by the state. With state control of these goods, it is possible to carry out direct allocation and distribution according to plans. Also, state material and commercial sectors may put goods on the market and organize free buying and selling.

A free market under a planned economic system differs from a free market under capitalism. Besides being restricted by state policies and laws, state controlled goods may also enter the free buying and selling market. If the free market can play a role in "market regulation" in supply and demand, the goods controlled by the state can also play a role in "regulating the market."

If the aforementioned concepts become established, then "planning" and the "market" will no longer be antagonistic categories. To implement a socialist planned economy, there should be integrated unified planning including both direct and indirect control. As for the realization of unified planning, we should give priority to direct control and regard indirect control as secondary. Under certain conditions this may be reversed. A socialist economy is a unified market, including both a market directly controlled by the state and a free market indirectly controlled by the state. If we are to say which is primary and which secondary, the market directly controlled by the state secondary. Similarly, under certain conditions this may be reversed. The two aspects of the contradiction are not planning and the market; actually, the problem that must be resolved is the contradiction between direct and indirect control.

III. Resolving Through Practice the Issue of Methods of State Control Over Economic Activities

Since the 3d Plenum of the 11th CPC Central Committee, the experiments we have carried out in reforming the economic management system, the policies we have implemented to open up to the outside world and revive the domestic economy, and the expansion of enterprise autonomy and local economic jurisdiction have all restructured circulation channels and expanded the role of market regulation. Everyone acknowledges that the direction of reform is correct and that successes have been remarkable.

However, while reviving the economy, macroeconomic control has not kept up. At present a problem that urgently awaits solution is the problem of control, that is, the reform and improvement of planning management.

After formulating plans for social and economic development, the state must do many things to practice control and regulation so as to realize plans. What must the state primarily control? I think that the state must control the production and circulation of goods and control the distribution of national income. Both direct and indirect means of control must be adopted to exercise control in these two areas.

As for the production and circulation of goods, the state should exercise direct control of those primary goods that affect national policy concerning people's livelihood. However, is direct control attained by issuing "directive" plan targets? Historical experiences show that merely having target amounts on paper does not fully solve the question of control. Planning and control are two concepts, and considering directive planning to be equivalent to exercising control is muddled thinking. There must be practical measures of control. In the past, directive planning relied on fulfillment of accounting targets to evaluate the production results of enterprises. Nevertheless, there are numerous problems involved in assessment using targets. In order to fulfill production value, it is possible to blindly produce goods with high production value. It is also very difficult to reflect the actual quality of products by relying on targets, and because the use value of products is varied, it is very difficult to express quality norms using uniform data. Moreover, state issuance of directive targets to enterprises may be characterized as an administrative measure with rights but no responsibilities. Often planning departments only issue general production value or output targets. What are the particular varieties, what are the specifications? Where are the prospective sales targets? Who provides the required production conditions? No answers are provided to these questions. To date, control of planning targets has been decentralized, departments are in charge of output, localities demand production value and financial departments demand profits. None is connected to the other. This kind of directive target creates even more difficulties for enterprises.

To truly exercise direct control of the production and circulation of goods, besides issuing directive plans, state material and commercial departments should represent the state in ordering goods from enterprises, in clarifying variety, output, and delivery date for goods, and in carrying out a product quality checking system (spot checks using mathematical statistical methods may be used for products manufactured in large quantities). Guarantees must also be provided for the conditions necessary for production in enterprises. The above mentioned rights and responsibilities are set down in contract form. In this way enterprises are responsible for guaranteeing the fulfillment of state orders for goods in terms of quality, quantity, and according to schedule. Material and commercial departments as well as offices in charge of coordinating enterprises must also represent the state in carrying out responsibilities toward enterprises.

By signing a contract, administrative orders become economic acts which embody a management system made up of responsibilities, rights, and benefits.

Directly controlled goods are centrally bought and sold by the state or there is planned purchasing by the state. Other goods may be selectively purchased and sold on behalf of the government or independently marketed by enterprises. These goods may be indirectly controlled by price, taxation, etc.

As for the control of distribution of national income, first, there is control of the ratio between accumulation and consumption; second, the distribution of accumulation; and third, the distribution of consumption.

As for the distribution of accumulation funds, the state should directly control investments in key construction projects. However, there must be a specific proportion in accumulation funds set aside for enterprise production construction funds which are to be independently allocated by enterprises. The state still retains ownership of this portion of the fund, while enterprises only have utilization rights, primarily for technological transformation. The extent and limits of utilization may be determined by the state. Another portion may be considered a medium- or short-term loan by the bank to support small-scale construction which corresponds to plans. The use of these two portions of the accumulation fund comes under indirect control. Economic levers may be used for regulation so as to urge production construction to meet the needs of planning objectives.

As for the control of consumption funds, in terms of the macroeconomy, there must be rational distribution of the entire consumption fund. The portion that is distributed to enterprises is the enterprise staff and worker consumption fund which includes wages, bonuses, and daily welfare expenses, etc. It is transformed into the portion consumed by individual staff and workers. It constitutes such a large proportion of the entire national income that the state must exercise control. As for enterprises, the state must stipulate the proportion of enterprise net output value in the consumption fund. Enterprises may determine independently how to distribute the staff and worker consumption funds within enterprises on the basis of labor.

The particular opinions mentioned above are of course only some ideas which are not yet fully formed. I presented these examples to demonstrate that "planning" and "control" are not one concept. There may be and there should be some directive planning, but this does not amount to a resolution of the problem of macroeconomic control, which requires the study of methods of direct and indirect control. Under a socialist planned economic system, planning acts as a common goal which is predicted. It is entirely feasible for the state to correctly use the two means of direct and indirect control to regulate all national economic activities so that there is both autonomy in basic level enterprises and centralized, unified state leadership. The state must carry this out in a flexible but orderly manner; there must be centralization but not stifling overcentralization. This requires the concerted effort of theoretical circles and practical work departments. We must liberate ideology, seek truth from facts, earnestly analyze experiences in planning work over the past 30 years and in systems reform over the past 3 years. We must head along the new path of implementing a socialist planned economy.

3. Encouraging and Protecting Competition [pp 115-121]

[Text] [Editor's note] This article was published in GONGREN RIBAO, 3 June 1980, under the name "Special Commentator." [End of editor's note]

I. Competition Is an Objective Law of General Commodity Production

During the process of integration of planning regulation and market regulation following initial reforms in the economic system, some enterprises launched competition which revealed their superiority and vitality. A decrease in planning tasks since 1979 forced many enterprises to enter the market "seeking rice that has fallen out of the pot." As soon as they entered the market they unavoidably ran up against a competitive opponent. In the past, production was emphasized while marketing was not; whether varieties were many or few, and whether quality was good or poor, sales were guaranteed by state centralized procurement. The state also assumed sale responsibility for making a profit and sustaining losses: "The daughter of an emperor need not worry about getting married." Upon entering the market the workstyles of these "government industries" and "government businesses" were no longer satisfactory. Markets had to be found for products and consumers had the freedom to purchase selectively. Products only became popular when the products met market demand, were high in quality, and cheap. Otherwise we might as well have stopped work, stopped production, eliminated bonuses and even stopped paying wages. What could they do? The secretaries and plant managers had to personally seek out markets, pay visits to consumers, initiate services, increase variety and assortment, improve product quality, deliver goods on time, undertake responsibility for repairs, refunds and exchanges. In the past, repeated injunctions failed to work, while now things are done "automatically." What is the reason for this? Competition.

It is generally acknowledged that China's current system of economic management must be reformed. In the past year or so there has been a major theoretical breakthrough, that is, the acknowledgement that in China's current phase of socialism not only must we not abolish or restrict the commodity economy, but make every effort to develop it. Since it is necessary to implement commodity production, competition, an objective law in general commodity production, will inevitably play a role in socialist commodity production. This is not determined by the subjective will of the people.

In the past the people have associated the term competition with capitalism. For many years we have avoided mention of competition because we feared association with capitalism. Actually, this is a misinterpretation. Competition is an objective law of general commodity production, not a law unique to capitalist commodity production. Capitalists are unscrupulous in their efforts to rake in profits; they benefit at the expense of others and wage a life and death struggle in the market in which survival of the fittest rules. Under the capitalist system of private ownership, these phenomena are objectively existing facts and they are connected to competition. However, the connection between these two phenomena is not necessarily a causal one.

In terms of the inherent nature of the capitalist, it is not so much that he wants to compete as that he wants even more to monopolize. If he can monopolize the market he will seek exorbitant profits without scruple. The capitalist feels compelled to vie competitively. Competition, it should be noted, serves to promote historical advancement, while a monopoly "will inevitably give rise to the trends of stagnation and corruption." This is historical dialectics. We know that contradiction is the internal motive force for the development of things and that without it there is no movement. We can even go so far as to say that without contradiction there is no life. Competition is one form of movement in the contradiction of the general commodity economy. The use value of commodities can only change with each passing day through competition and only competition can spur on the rapid growth of science and technology. The value of commodities can only enable socially necessary labor to decrease day by day through competition while labor productivity continues to improve. During the period of China's First 5-Year Plan there was fierce competition in the state-run economy and the privately run economy. At that time the state-run economy was dynamic, it quickly triumphed over capitalist management and won great victories in socialist transformation and construction. Following the completion of socialist transformation both the system of state ownership and the system of collective ownership coexisted. There was no competition, however, and bureaucratism in economic management grew steadily such that the economic structure gradually became rigid and labor productivity dropped alarmingly. Twenty or more years of practice demonstrates that under socialist conditions commodity production becomes like an exclusive business; no other branch office exists. The market is totally monopolized and there is no competition. The economy then cannot develop in a lively and active manner. We must accept competition and use it correctly. Only then is it possible to promote improvements in the level of socialist economic management and technology and only then is it possible to accelerate even further the development of the socialist economy and fully demonstrate the superiority of the socialist system.

II. Competition Among Enterprises

The central issue in China's economic system may be summarized as follows: Is it better to stimulate the economy further or to control it further? After some discussion, the unanimous decision was reached that it is necessary to further stimulate the economy.

In order to do this, it is necessary to change from state centralized management to state unified leadership. Under unified state leadership it is necessary to implement a socialist commodity economy and accept the enterprise as the basic unit in socioeconomic activities; to accept the enterprise as a relatively independent commodity producer; to accept the enterprise as having its own independent economic interests; and to acknowledge that the enterprise, while observing state economic policies and laws, has the right to obtain its own profits in addition to strictly performing its duties to the state. Under the planning guidance of the state, the enterprise has a certain amount of autonomy in production management. Only in this way can the enterprise become a vital and thriving economic entity and thereby stimulate the entire national economy.

Having recognized that enterprises have independent economic interests, it is inevitable that disparities in profit levels develop among enterprises. These disparities arise from competition. The commodities or the quality and quantity of services provided to satisfy the demands of society are the concentrated expression of the results of enterprise production. The greater the contribution the greater profits should be. Actually, this is the reflection of the socialist principle of distribution according to labor and it is the chief reflection of this principle. If egalitarianism is the primary cause hindering economic growth, then the problem of "eating out of one big pot" among enterprises, regardless of management, profits or losses, is extreme egalitarianism. If we do not first solve this problem, we will be unable to stimulate the economy. Some comrades believe that under a socialist system we can only engage in emulation, not competition. As we have analyzed above, competition is an objective law of general commodity production. Unless you do not engage in commodity production, it is absolutely necessary to emphasize competition. However, socialism is after all different from capitalism. The socialist system of public ownership determines that enterprises have individual interests as well as common interests. Consequently, there are competitive relations among enterprises so that they can seek their own interests and competitive relations to increase common profits. The difference between competition and emulation is that competition is inevitably linked to material profit and is ultimately manifested in "the good winning and the inferior losing." Comrades who fear competition have misgivings concerning just these two points: they fear that emphasizing material gains will lead enterprises on the wrong path of "putting profit first," and that emphasizing the idea that the good win and the inferior lose will give rise to the tragic scene of "the failure and death of some and the triumph and control of others." This apprehension is totally unnecessary. These comrades have forgotten that we are a socialist society, our commodity economy is a commodity economy under the unified leadership of the socialist state. The state's policies and laws will protect competition and the legal rights and interests of enterprises and also supervise illegal profit-making. They allow there to be profit disparities among enterprises due to the quality of the management of production while also correcting excessively large profit disparities using economic measures. The manifestation of the good winning and the inferior losing is also different from capitalist society. During competition an enterprise's small failures result in decreased profits and are expressed as less labor and fewer profits; large failures tend to weed out the inferior and are expressed as shutdowns, stoppages, mergers, and changeovers. Enterprise leaders have to assume economic and legal responsibility while staff and workers must also sustain some economic losses. However, under state uniform overall arrangements the situation is still far removed from that of capitalism with enterprise bankruptcies, suicides by business managers, workers becoming destitute and homeless, etc. Nevertheless competition still has relatively great coercive power. In the present phase of socialism, spiritual and material spheres still lack preconditions for communism, so to only emphasize conscious emulation while ignoring mandatory competition makes it impossible to effectively encourage advancement and spur on backward areas. It also makes it impossible to fully motivate the initiative of enterprise producers and managers. This is an undeniable fact of materialism. As a result, we must both promote emulation and protect competition. Although under socialist conditions they may not replace each other, they may supplement each other.

III. How To Handle the Side Effects of Competition

Every object can always be divided into two; therefore we cannot say that there is no bad side to competition. During the early phase of systems reform, work in all areas did not keep pace so it was not unusual for all sorts of errors and problems to occur. For instance, since 1979, market regulation has sprung up and competition has just emerged while problems such as enterprises engaging in technology blockades and regions "carving up the land into prisons," etc., have appeared. Technology blockades affect the rapid exchange and promotion of advanced products and technology which obviously are disadvantageous to economic growth. However, it must also be realized that in the past, technological inventions and creations lacked the protection of patents, which could not encourage advancement. The state should draft a "patent law" to encourage material and spiritual incentives for inventions and to facilitate the exchange and dissemination of goods. Enterprises could then transfer or concede patent rights for compensation. In this way we can protect competition both domestically and abroad which, in the final analysis, benefits economic growth. "Carving up the land into prisons," that is, severing economic relations between regions, is certainly not a good idea. The solution is to advocate unity. On the basis of accepting individual material benefits, it is necessary to voluntarily talk things over, ensure that there are mutual benefits, use all forms of compensation, praise each other's strong points and compensate for weak points, and fully develop the strengths of each area. In this way it will be possible to obtain even greater economic results.

In summary, during the process of stimulating the economy it is only natural that all sorts of problems crop up. As long as we keep abreast in our work, sum up experiences in a timely manner, and formulate the necessary policies and legislation, we can revive rather than stifle the economy.

Continuing to increase labor productivity is the fundamental guarantee that the socialist system will triumph over the capitalist system. In order to increase labor productivity, we must strengthen ideological and political work, continue to increase the socialist consciousness of workers and the masses, carry on the communist style of work and launch socialist competition of emulating each other, learning from each other, keeping up with each other, helping each other, and in turn surpassing each other. At the same time it is also necessary to make use of economic methods, encourage and protect competition, fully develop the initiative of managers and manufacturers, stimulate economic work, and seek even better economic results. Only if China's socialist economy is in this kind of "good shape" will it present a scene of prosperity and vitality.

4. Several Questions Concerning Distribution According to Labor [pp 199-205]

[Text] [Editor's note] This article was published on 21 March 1980 in GONGREN RIBAO. Some revisions and additions were made upon inclusion in this book. [End of editor's note]

The discussion launched by GONGREN RIBAO on "How To Motivate the Initiative of Staff and Workers" is essential. During the discussion many comrades talked about correctly implementing the principle of distribution according to labor, which is a key to motivating the initiative of staff and workers. However, there are many problems concerning how specifically to implement this principle in actual practice that must be explored and investigated. Below are some of my views on this matter.

I. It Is Not Possible To Simply Apply Marx's Classical Exposition

What is distribution according to labor? In general, we all consider Marx's discussion in his "Critique of the Gotha Program" as the classical interpretation. He said: "After each producer has made deductions he should reclaim from society all that he has given to it." He also said: "The rights of producers are in proportion to their labor; equality consists of measurement using the same yardstick--labor." (Footnote 1) ("Collected Works of Marx and Engels," Vol 3, People's Publishing House, 1972, pp 10-11, 11)

Marx's words illustrate the basic principle of distribution according to labor, that is, "the rights of producers are in proportion to their labor." However, today as we carry out distribution according to labor, it is still impossible to simply put these words of Marx into practice. Marx imagined that after implementing a system of public ownership, it would be possible to eliminate commodities and the commodity economy. Consequently, the actual labor of producers could be directly converted into social labor and, based on the amount of individual labor, they should receive their share from society. Present practice has proven that we cannot yet eliminate commodities. The "labor" in distribution according to labor is not the "labor" envisaged by Marx; it can only be calculated as average socially necessary labor. That is to say, an individual's labor must be reflected in commodities while the amount of labor that goes into commodities is only the average socially necessary amount of labor.

In highly socialized commodity production, individuals cannot directly provide labor results to society. The classics contain numerous discussions of the collective nature of modernized large-scale production. For instance, in his essay "On Authority" Engels repeatedly stressed this point. The replacement of joint activities by the "trend" towards independent activities of individuals as foreseen by Engels over 100 years ago has already become an even more striking and obvious objective reality following the development of modern science and technology.

The conversion of human labor into socially effective labor can only be expressed by having product use value. Once products are used by society, the labor inherent in the products is then acknowledged. However, in modernized production it is difficult for any one producer to say that a certain product was produced by "me." One can only say that it was collectively manufactured by economic units (enterprises) formed according to the social division of labor. Within enterprises an individual's labor only forms one part of the product; only by relying on all the workers in the enterprise is it possible to complete the whole product. Only in this way does individual labor become effective labor. Take for example the qualified semifinished goods from first line processing. If they are discarded during second line processing then the labor that went into the first line processing is tantamount to ineffective labor.

The above section has been concerned with the "quality" of labor but the same questions apply to the "quantity" of labor. The amount of labor recognized by society is naturally not specific actual amounts of labor but rather the amount of average socially necessary labor. Therefore, only through the total value of products handed over to society is it possible to measure the entire contribution made by enterprises to society. We cannot directly measure the individual's labor contribution.

Thus it can be seen that Marx's explanation of distribution according to labor can only be understood as a principle; it cannot be simply put into practice.

II. In Distribution According to Labor It Is First Necessary To Carry Out Distribution According to the Collective Contributions of Enterprises

In the historical phase of socialism the national economy still regards the enterprise as the basic economic unit. Enterprises should have some independence. If we change Marx's exposition on distribution according to labor so that each enterprise makes labor contributions to society, and after all deductions are made all that is given to society is returned from society, this would actually correspond to our current situation.

Our feeling that "it does not matter whether we do a good job or bad, it is all the same" is a form of egalitarianism which does not help stimulate initiative. However, what we should first attack is the lack of concern about doing good work among enterprises, and only then the problem of distribution among enterprises. At present the greatest weakness of the economic management system consists of enterprises "eating out of one big pot" and engaging in egalitarianism. The overall problem of distribution according to labor has not been resolved, but within enterprises there is distribution to individuals on the basis of labor. Apparently we have put the cart before the horse. The reason for this is that we have simply used the principle of distribution according to labor to carry out distribution according to the size of individual labor contributions. We have disregarded the fact that individual labor is only transformed into social labor through enterprise products (or labor services). Thus we have also failed to consider the problem of first carrying out distribution according to the size of the collective contribution of the enterprise.

Society's implementation of distribution to enterprises according to labor is primarily manifested in the distribution of gross wages plus profits by enterprises. The profits of socialist enterprises differ from the profits of capitalist enterprises. Regardless of whether the method of profit sharing or paying income tax is adopted, both involve distribution between the state and enterprises. The portion handed over to the state is what Marx called "deductions." Enterprises do not receive all the profits; whatever an enterprise receives is directly linked to the quality of production management and the results obtained. Under the readjustment and control of the state, the amount earned by enterprises generally reflects the proportion of the enterprise's labor contribution to society. Thus we may say that it is a form of distribution according to labor.

The working class is characterized by its sense of organization and discipline and its spirit of collectivism. The emergence of such a character is inextricably linked to the modern socialized mode of production in which workers participate. The individual interests of staff and workers and the collective interests of enterprises are interlinked and determined by modern socialized mode of production. First carrying out distribution according to enterprise collective contributions leads to staff and workers being concerned about the labor results of enterprise collectives. This concern will be of help in strengthening the collectivist thinking of staff, workers, and the masses. This collectivist thinking is also inevitably a step toward cultivating communist ideology. If we ignore distribution to enterprise collectives on the basis of labor and are only concerned with distribution to individuals within enterprises according to labor, this will cause workers to only be concerned about individual, not collective results. This, in turn, would be disadvantageous to the development of enterprises and to consolidating and developing collectivist ideology.

III. During Distribution According to Work Within Enterprises It Is Also Necessary To Stress Distribution According to the Labor Contribution of Small Collectives

Individuals cannot directly contribute labor to society, nor can society directly carry out distribution according to individual labor. Thus is it possible to carry out distribution totally according to individual labor within enterprises? This is not entirely possible.

First of all, it is very difficult to accurately measure the amount of labor performed by an individual; at best we can only approximate. It is generally acknowledged that a wage scale is one form of distribution according to labor. In fact, the differences among wage grades mainly reflect approximate differences in the work capacities of workers, not the quality and quantity of work actually done during a particular year or month. Theoretically, piecework wages are better able to reflect the quality and quantity of work actually done, but this method of piecework cannot really be adopted for all work.

Next, because labor is highly socialized, the quality and quantity of labor performed by an individual similarly cannot be completely measured by the labor results of that individual. Take piecework wages for example. A producer fulfills production norms for a specific quality and quantity. Besides that individual's ability and amount of labor expended, there are many other external factors involved such as whether the equipment is easy to operate or whether a mechanic is needed; whether tools, cutting tools, etc., are ready and usable, which is determined by the manufacture of tools and the labor of administrative personnel; whether raw materials, semifinished products, and semimanufactured goods are adequate, which is determined by the quality of material supply work and the collaborative work in first line work process; whether production can proceed without interruption, which is determined by the perfection of the production structure and management work, etc. Consequently, it does not fully correspond to reality to give full credit to an individual for individual labor results in large-scale socialized production.

Following developments in automation and combined action production technology, the continuity and integration of production has increasingly improved. A producer with automated production lines of course has no way of distinguishing or measuring individual labor results. The production work assistance and services rendered by the entire workshop are frequently closely linked and cannot be separated.

Lastly, a new problem has arisen in the modernization of production technology: the role of intellectual work is expanding. On the one hand, there has been a relative decrease in workers on the first line of production while on the second line of production there has been a relative increase of departments engaged in auxiliary work and an increase of technicians on the third line engaged in scientific research, experimentation, design and technology, and of production organization administrative personnel. On the other hand, the proportion of intellectual work even for first line workers has increased. Measuring the results of intellectual work and the quality and quantity of intellectual work is even more difficult than measuring physical labor.

From the above it is apparent that in order to implement distribution according to labor within enterprises it is necessary to determine compensation completely according to the size of individual expenditure of labor. In reality, this is difficult to do.

Such being the case, can there only be egalitarian distribution within enterprises? Of course not. The primary means for resolving the above-mentioned contradiction is to stress distribution within enterprises according to the labor contributions of small collectives so that individual material interests not only are linked to the business results of enterprises but also to the labor results of small collectives (administrative offices, workshops, workshop sections, teams and groups, production lines, etc.).

To sum up the above, in order to implement the principle of distribution according to labor within enterprises, it is necessary to interlink individual interests of staff and workers to collective interests. The source of individual interests of workers can roughly be seen in these three areas:

1. Distribution in which basic wages are obtained based on individual work capacity and according to the grade stipulated. This is an important part of distribution according to labor.

2. Actual distribution in which living wages are obtained based on the quality of enterprise business results which determine the level of living wages (including awards, year-end bonus sharing, etc.) and based on the extent of individual or small collective contributions. This is also an important part of distribution according to labor.

3. Based on the quality of enterprise business results, different levels of collective welfare benefits are enjoyed (including housing, welfare benefits for chilren, recreation, etc.). Although these benefits are not directly linked to individual labor, they are obtained when society carries out distribution to enterprise collectives according to labor. Thus this is also an important part of distribution according to labor.

The major part of these above three interests comes from collective results. It is necessary to encourage workers to not only work hard to increase individual capacities but also to be concerned with the collective so as to strengthen internal unity and cooperation and to strive to improve collective results.

When society implements distribution according to labor in enterprise collectives and enterprises also implement distribution to workers according to labor, this causes workers to care about collective and individual labor results in terms of material benefits. At the same time, we should also guide workers and the masses to be concerned with state interests. To this end, it is necessary to strengthen the ideological and political instruction of workers and to carry out the necessary reform of the economic management system. The state must directly bear the costs of some social insurance and welfare benefits and, in keeping with national economic growth, continue to upgrade the level of these welfare benefits. In this way it is possible to ensure that staff and workers better acknowledge the unanimity of the three interests--the state, the collective, and the individual--and improve their socialist awareness so that they consciously make greater contributions to the state.

5. Distribution According to Labor and the Wage System [pp 222-258]

[Text] [Editor's note] This article was presented by the author on 24 November 1981 to the "National Labor Wage Research Group" held by the State Central Labor Bureau. [End of editor's note]

The topic under discussion is distribution according to labor and the wage system. There are theoretical considerations concerning this matter as well as actual experiences, particularly the former. I will neither discuss wage theory nor devote myself to practical work in labor wages. I am not qualified to speak of this either in terms of theory or practice. Everyone may read my article, "Several Questions Concerning Distribution According to Labor," published by GONGREN RIBAO in 1980, and my later article, "A Look at the Principle of Comprehensive Material Interests," also published by GONGREN RIBAO. These two articles aroused the interest of numerous grass-roots level comrades. Since at that time wages were being restructured and these two articles discussed the very question, much interest was aroused. Although reactions were relatively strong, this does not mean that the articles contained any remarkable truths or proposed programs with great practical significance. I have merely kept abreast of the tide. There were those in theoretical circles who wrote articles discussing my views. Some said that they strongly approved of my ideas on wage reform but that my theories merited some discussion. I feel just the reverse. I feel that my suggestion concerning the wage system is only a tentative proposal and not necessarily fully geared to reality. I feel that comrades here today could recommend even better plans for reform.

There is, however, some justification for my opinions. Of course, I am not a specialist on distribution according to labor and I have not made an overall in-depth study of the writings of Marx, Engels, Lenin, and other classical writers. Moreover, it is not possible to go into much detail on theory in a short article, particularly when it concerns distribution according to labor. There is much controversy over many questions, so it is necessary to go into some detail on my own opinions and this requires quite a bit of space. Nevertheless, the problem I mentioned, that one cannot merely focus on distribution according to labor to the individual, is a very real problem.

Theories must be able to answer real problems. I have not yet had the time to write a response to those several articles that discuss my ideas. However, real life has provided convincing answers on my behalf. In 1981 the system of economic responsibility was promoted everywhere in order to resolve the two problems of "one big pot." The essence of this system was to resolve the problem of the two levels in distribution according to labor. Furthermore, actual practice has shown that even within enterprises it is not possible to completely carry out distribution directly according to individual labor. Each enterprise has created many methods of distribution according to labor which put the collective first and the individual second. This has been necessitated by objective reality. We are here today to carry out discussions. This is very good, for I now have the opportunity to go into a bit more detail on my own unformed opinions. We are all senior comrades, we have had rich practical experiences and done specialized theoretical research. I hope you will help me figure out where I am mistaken and where I am correct. Thus, I basically will not present a report but rather offer a few remarks in the hope that you will offer your valuable opinions! I will present some opinions so as to solicit your ideas and, on this basis, I am here today to deliver a talk.

I. The Socialist Distribution System

Distribution is a major link in our overall socioeconomic life. Different social systems have different distribution systems. In a certain sense a distribution system is often an important indicator of different social systems. Distribution refers to distribution in the broad sense; it involves distribution of the means of production as well as the means of subsistence. According to various theories of Marxism, production distribution determines the distribution of consumer goods. Distribution according to labor is just such a link; it refers to distribution of the means of subsistence.

We believe that the distribution system is often an important indicator of a social system. In terms of our socialist system, this is quite obvious. What characteristics does a socialist society possess? We could discuss many different areas, but there are at least two indicators of a socialist society: the system of public ownership and distribution according to labor. In reality the system of public ownership implies distribution of the means of production. A capitalist society has a system of private ownership and the means of production are completely owned by individuals. In the socialist system of public ownership the means of production are owned by all the people or by the collective. This is essentially a question of distribution of the means of production. Distribution according to labor refers to distribution of the means of subsistence. According to Marxist economic theory, the distribution of the means of production determines the distribution of consumer materials. Therefore, if the means of production are privately owned, there cannot be distribution according to labor. There must first be distribution on the basis of capital. Theoretically, this capital must be distributed according to the average profit rate and amounts of capital involved. Of course, in actual distribution, because of competition and other reasons, there may be unequal suffering and joy, the inequality of suffering and joy within capital. Under such conditions the labor force is a commodity, as workers and employees consider their own labor a commodity. Exchange is carried out according to the market price and capital of the labor force in order to obtain distribution of a share of products. After the means of production has changed to the system of public ownership, it is possible and inevitable that the method of distribution according to labor be adopted. Of course, when a communist society comes about in the future it will change to distribution on the basis of need. In the socialist phase we must still adopt the method of distribution on the basis of labor.

Today we must explore distribution according to labor. That is, how are the consumer goods produced by society ultimately to be distributed? This question is essentially inseparable from the overall distribution system; we cannot discuss it in isolation. We clearly run into this question in our current initial experiences in carrying out system reform. Distribution according to labor necessarily involves other distribution questions. For instance, we frequently bring up the question of correctly handling the three interests of the state, the enterprise (collective), and individual staff, and workers. What does this issue involve? Basically, this is a question of how to make the entire distribution system more rational.

In my two 1980 articles I suggested that distribution according to labor be divided into two levels: first, carry out distribution according to labor among enterprises to solve the problem of enterprises eating out of "one big pot"; second, carry out distribution according to labor within enterprises to solve the problem of employees eating out of "one big pot." Some comrades in theoretical circles believe that among enterprises the problem is exchange of equal value, not distribution according to labor. The problem of distribution according to labor exists only among staff and workers. There is some basis for this view. Naturally the problem of equal value exchange exists among enterprises. My enterprise produced a machine tool and sold it to another enterprise. According to the principle of equal value exchange, my enterprise should have received payment (assuming that the price was reasonable and the price and value of the machine tool were equal). This payment would constitute the enterprise's sale income. If it is a privately owned enterprise, once the act of equal value exchange has been completed, it is practically as if distribution has been out. Since capitalists make use of wages and the labor force of workers to carry out equal value exchange, production costs are deducted from income from payments and the remaining profits are distributed into their pockets. Comrades who maintain this view have forgotten that the net income realized by our socialist enterprises, particularly state-owned enterprises, does not entirely belong to the enterprise. It must be distributed between the state and the enterprise. As for the current procedures in system reform, a share is delivered to the state through the method of tax revenue and profit delivery while another share is retained by the enterprise. This share retained by the enterprise, "profits," is further divided into the production development fund, the collective welfare fund, the bonus fund, etc. One portion of these funds is still owned by the state but the enterprise has allocation rights; the other portion is transformed into income for individual staff and workers. The principle we are presently observing is that not only must the income of individual staff and workers be linked to individual labor results, it must also be connected to the enterprise's overall production results. That is, it makes a difference whether the enterprise does well or badly. If an enterprise does well workers should receive more income. This no longer involves the matter of equal value exchange, then, but rather distribution. Consequently, once there is equal value exchange between enterprises, the question of distribution remains.

During system reform, regardless of whether profit sharing or profit contracts are implemented, the difficult problem of "unequal suffering and joy" will occur. What is the meaning of "unequal suffering and joy?" If we say that doing well or badly should make a difference, then this means that unequal suffering and joy is rational. So, those who do well should be joyful and those who do badly should suffer. At present unequal suffering and joy refers to enterprises which are on a par in terms of subjective effort. Some may obtain higher profits and some lower to the point that wide disparities may exist. This phenomenon is considered irrational and unequal suffering and joy. In capitalist enterprises this phenomenon is basically not a problem. On the contrary, every capitalist hopes that he will obtain superprofits that surpass the average profit rate and even hopes to reap colossal profits. What he seeks is personal joy at the expense of the suffering of others. We require that doing well or badly makes a difference and oppose the latter sense of unequal suffering and joy. Thus, wherein lies the problem? It lies in seeing to it that the profits obtained by enterprises are consistent with the extent of their subjective effort. What is the extent of an enterprise's subjective effort? It is simply the amount of labor contributed by an enterprise as a whole to society (including the quality and quantity of labor). How specifically to measure the amount of labor is a problem that needs to be studied. In principle, we are now introducing the problem of distribution to the enterprise as a whole according to labor.

When Marx discussed distribution according to labor he said that it was first necessary to make "deductions," namely, first deduct the portion handed over to the state (on behalf of all workers) and then carry out distribution among individual workers. However, he never explained the criteria for this deduction. How much should be deducted and how much retained? Another question has been raised by actual practice, that is, how to rationally handle the distribution of profits between the state and enterprises.

The problem of distribution has been discussed in the field of political economics. It is believed that there are two instances of distribution of national income under a socialist system. The first instance of distribution (initial distribution) takes place within material goods production departments and constitutes the original income of the socialist state, the collective economy, and production department workers. The second instance of distribution takes place later with distribution of national income (redistribution). Income is used for construction investments, to establish social welfare undertakings, and for expenses in culture, education, public health, national defense and administrative management, the wages of nonmaterial production personnel, etc.

From our practical experience it can be seen that there has been some change in these two distributions and the way they should be implemented on paper. The first instance is distribution between the state and enterprises; the second is redistribution. Not only must there be redistribution of national income but also redistribution of enterprise income among employees. The principle of distribution according to labor must be applied to the distribution of the means of subsistence during these two instances of distribution.

In the first distribution, distribution between the state and enterprises, it is nececessary to embody distribution according to labor to the enterprise as a whole. That is, it is necessary to ensure that enterprise earnings (this refers to that share which is used for individual worker or collective consumption such as wages, bonuses, welfare expenses, etc.) are consistent with the quality and quantity of labor expended by the enterprise and to overcome the phenomenon among enterprises of eating out of "one big pot." During redistribution or distribution within an enterprise, the share of nonproduction personnel income must also conform to the principle of distribution according to labor. To this end, the principle of distribution according to labor should be reflected in the overall socialist distribution system and not only be limited to distribution among individuals within an enterprise. Furthermore, society's distribution to enterprises according to labor should still be the prerequisite for distribution according to labor within an enterprise.

II. Society's Distribution to Enterprise Collectives According to Labor

Is it possible to ignore distribution to enterprise collectives according to labor and only focus on distribution to individual workers? I believe that experience has proven that this approach entails numerous problems. Since we acknowledge that under a socialist planned economic system it is still necessary to have commodity production and to apply the law of value, then theoretically, it makes no sense to try to depart from commercial successes and go on to directly measure individual labor expenditures to society. In practice this would inevitably give rise to numerous contradictions.

The article I published in 1980 in GONGREN RIBAO raised one issue. Marx's exposition on distribution according to labor is correct as an elaboration of a principle but, in terms of specific descriptions and methods, it requires further exploration. Based on his statements on distribution according to labor in his "Critique of the Gotha Program" and according to his argument, each individual provides a certain amount of labor to society, and once all of society's demands have been deducted, a proportionate amount of labor is recovered from society. I have proposed a different view of this point. I am not trying to be different merely for the sake of being different, but rather because if we simply follow this idea in actual practice, we will find numerous contradictions. We are Marxists and as such endorse the fundamental tenets of Marxism. Nevertheless, we cannot accept that everything Marx said is absolutely accurate in any given context. Real life is ever-changing, and thus we should proceed from real problems to explore and understand the spiritual essence of the fundamental tenets of Marxism. The actual wording may be revised and supplemented.

In general, when we discuss distribution according to labor and its definition we primarily cite Marx's statement in his "Critique of the Gotha Program": "After each producer has made deductions he should reclaim from society all that he has given to society. What he has given to society is his individual labor." (Footnote 1) ("Selected Works of Marx and Engels," Vol 3, People's Publishing House, 1972, pp 10-11) These lines explain that under socialism, that is, the early stage of communism, the distribution of the means of subsistence among individuals must be linked to their labor. Of course, it is not possible to return all the labor results of an individual to that individual. It is necessary to set aside some of it to satisfy the needs of society, including state management, social welfare, etc. Therefore, it is necessary to make deductions, and that remaining portion is distributed proportionately according to the different amounts of labor expended. For every unit of labor expended, an individual should reclaim a certain proportion of that unit of labor, not the entire unit of labor. Thus the general tenet is entirely correct.

Nevertheless, there is a problem here. Marx spoke of workers claiming from society all that they have given to it. This means that "expended" and "reclaimed" are the direct actions of individuals against society. This point merits further discussion. At that time Marx imagined that after implementing a system of public ownership, commodities would be eliminated and the concrete labor of workers would become direct social labor. Practice has shown, however, that a socialist society must still implement commodity production. Society must acknowledge the average socially necessary labor inherent in commodities. It is not actual labor. Moreover, large-scale socialized production differs from small commodity production in which individual labor may be directly provided to society and later directly recovered from society. To be sure, today we still have some self-employed workers such as door-to-door shoe repairmen. They come to repair shoes upon request and receive money for their work. They provide labor directly to society and receive compensation directly from society. This is simple, individual labor. At the present time most production is large-scale socialized production. As Marx and Engels emphasized in many places, in socialized large-scale production, who can say whether "I" produce this product or not. For instance, we cannot say which specific person manufactured the amplifier and thermos in use right here. Both are the end products provided to society after socialized, collective, and shared labor. Consequently, when implementing commodity production under conditions of large-scale socialized production, it is very difficult to change individual labor directly into contributions to society. Still, these words of Marx currently have a great impact on us as we actually implement the procedures for distribution according to labor. Our current methods are based on this statement; therefore, the very mention of distribution according to labor refers to distribution to individuals. If we measure individual labor according to overall norms and then determine compensation according to the amount of labor expended, one can see that an intermediate step is missing. Individual labor must coalesce into collective labor results and it must be measured according to average socially necessary labor. Only then can individual labor become valid labor recognized by socity, and only then can the individual receive his due compensation from society.

Some comrades cite Marx's statements made elsewhere. For example, he stressed that numerous individual labor efforts be used as one social labor force. They use this to show that Marx regarded the labor force not in isolation but rather as a component part of the social labor force. I believe that during the commodity production and exchange that we still implement

implement today, if labor expended by individuals directly constitutes a part of overall social labor, for instance if today I worked 8 hours and regardless of results I am recognized as part of overall social labor (for example, workers throughout the country work 4 billion hours), then we have actually become a communist society which disregards commodities. As a communist society does not engage in commodity production, it would not be necessary to have distribution according to labor but rather according to need. There would be no necessary direct connection between the distribution of the means of subsistence and the amount of labor expended by individuals. At that time the concept of value may still exist as a means of calculating labor but, according to the current concept of value, it will no longer exist. Therefore, at that time when we directly expend 8 hours of labor it is equivalent to 1/500-millionth of the 4 billion hours put in by all society, and we may directly calculate the amount of labor as a part of overall labor. Can we do this at present? No, we cannot. At present, can we say that if you work 8 hours it is acknowledged that you created 8 hours of value? That is similar to what Marx said somewhere else: the most clumsy carpenter can create the highest value. If the average socially necessary labor for one chair is 4 hours and today I spent 8 hours making one, then I have contributed 8 hours to society. In a communist society perhaps one may say that because each labor effort is one part of a total labor, 1 hour of work is a contribution of 1 hour of total labor. With our current commodity production we cannot look at labor in this way; it is necessary to measure it according to average socially necessary labor.

In his "Critique of the Gotha Program" Marx said: "The same principle is in effect here as in commodity equal value exchange, that is, a certain form and amount of labor may be exchanged for the same amount of labor of another form." (Footnote 2) (Ibid., p 11) However, this "amount" that he mentions is the amount of labor that is considered to be a direct part of society's total labor. In today's society this is impossible. At the same time, herein lies the answer to the question that has come under much discussion, namely, what does the term "labor" in distribution according to labor refer to? This has been discussed at several conferences on distribution according to labor. Based on the above, I believe that the "labor" in distribution according to labor first of all refers to abstract labor, not concrete labor. Different forms of actual labor are involved when a carpenter makes a chair, a blacksmith forges iron, or a machinist makes a machine. In theory, however, we can suppose that he expends a certain amount of abstract general labor. This is a fundamental principle of Marx's from his analysis of commodities. Next, how is the amount of abstract labor measured? According to Marxist economic theory, abstract labor is calculated using time. There is still the problem of "quality" of labor. We must differentiate between simple and complex labor, ordinary labor and intensive labor. One hour of complex labor may be equivalent to 2 or even 3 hours of simple labor and 1 hour of very intensive labor may be equivalent to 2 or 3 hours of less intensive labor. After converting quality into quantity, quantity may be calculated using time. What is this time? We cannot say that actually doing x number of hours of work is equivalent to x number of hours. We can only make calculations according to average socially essential labor, that is, necessary time.

What then is the "labor" in distribution according to labor? Average socially essential labor time. This time is manifested in the value of a commodity. Of course, commodities also have an actual price and price is not necessarily equivalent to value. It may be either higher or lower than value but that is another question altogether. How are we to understand average socially necessary labor? A capitalist society depends upon market competition for regulation and on the natural occurrence of large volumes of spontaneous exchange. How about a socialist society? Since a socialist society must still carry out commodity production, socially necessary labor time basically must rely on the market. However, we also have a planned economy so that our competent economic departments can adopt methods such as surveys, statistics and comparisons and, according to the law of value, consciously set down some prices and ensure that these prices correspond as much as possible to value and to average socially necessary labor time. But what does average socially necessary time refer to? I believe that first of all it refers to all commodities. It is very difficult to directly pinpoint the average socially necessary labor time for all the parts and labor that go into commodities. For example, relatively precise data on the labor that goes into a machine and the average socially necessary time may be found by means of statistics. As for a certain part for a machine such as an axle, it is only manufactured after going through a crude lathe and a refined lathe and then such processes as grinding. Is it possible to figure out the average socially necessary time for the crude lathe, the refined lathe, and grinding? Theoretically, this is not absolutely impossible. However, the scale of production throughout the country is so large. The variety of products so great, the number of parts so numerous, and the manufacture of each part requires so many processes, that realistically it is not possible to calculate the average socially necessary time for each process using statistics.

The common characteristics of some production processes are quite numerous. For example, textile production processes are basically the same so it is possible to determine the average national standard for each process and position. For most industrial products it is still necessary to regard the end product as the commodity and the result of collective labor and use it to represent the socially necessary labor time expended by this collective for society. This means that regardless of the number of people in your factory and regardless of the actual amount of labor time spent, society can only measure the labor supplied by this factory collective according to the quality and quantity of the product produced and according to the socially necessary time of the unit product. For instance, manufacturing a diesel engine requires an average of 500 man-hours. Your factory actually spends 600 man-hours, yet it is accepted that you supplied society with 500 man-hours of labor. Another factory spends 400 man-hours manufacturing the same kind of diesel engine, that is, 400 man-hours of real labor. They have supplied society with 500 effective man-hours. A measurement of the amount of labor expended for society based on the end product is actually the net product value of the product. Some of this labor may be measured by statistics and some may not, so it is also necessary to rely on market regulation.

To sum up the preceding ideas: the "labor" in distribution according to labor refers to average socially necessary labor. To measure this necessary labor we must measure the labor result, that is, the final commodity. Consequently, in distribution according to labor, it is first necessary to measure the labor results of enterprise collectives and carry out distribution to enterprises according to labor. However, another problem emerges at this point which was also touched upon at the conference on distribution according to labor: Is it possible to measure the amount of labor or the size of the labor contribution totally based upon the labor results? The extent of labor productivity does not depend only on the efforts of workers, it is also affected by technological conditions and the situation regarding natural resources. The technological facilities in some plants are quite advanced and productivity is high, while in others technological facilities are obsolete and productivity is low. There is also the situation regarding resources such as the mining of coal and the extraction of oil: if conditions are favorable, it is easy to extract resources, and if not, it is very difficult. Because these objective conditions outweigh the average income made by socially necessary labor, we call it "graduated income." Under a socialist system, because the means of production, particularly resources, are publicly owned, some of the workers do not possess all of this graduated income. There must be regulatory measures for specific amounts and once they are deducted product results can then reflect the labor expended by the enterprise for society. How to advantageously adjust this graduated income so that this can reflect the results of the enterprise's overall labor is a major difficulty that we encounter daily in real life.

During system reform the problem of "unequal suffering and joy" has been encountered in the implementation of profit sharing and the economic responsibility system and in the contract system. The first major cause for this phenomenon of unequal suffering and joy is irrational prices which have appeared over the years, and the second is this problem of graduated income. Some provinces and cities, particularly Sichuan, have experimented with substituting taxes for profits and assuming responsibility for profits and losses as well as adopting the method of an adjustment tax to regulate the unequal suffering and joy created by prices and graduated income. As for the problem of prices, the future reform of the pricing system will gradually make prices more rational. Only by adopting a property tax and a resource tax will it be possible to further readjust the problems of graduated income. By summing up experiences it is possible to find a way to specifically determine these adjustment taxes.

A product, if the price is rational, can reflect its total value. It is the net product value that remains after deducting material expenditures (previous materialized labor). After once more deducting the influence of some objective factors, what remains may reflect the labor expended by this enterprise collective for society. Should the enterprise collective fully recover from society this portion of labor income? No. According to Marx's principle of distribution according to labor, it is first necessary to make all "deductions," that is, to distribute this labor between the state and enterprise collectives.

Under a capitalist system the newly added labor created by staff and workers is distributed between workers and capitalists. Workers can only obtain wage income based on the market price of the labor force. The rest is considered surplus value belonging to capitalists and is divided up among several exploiting classes. Capitalist enterprises also pay taxes to the state, but it is essentially quite different from the "deduction" we have been discussing. We have a system of public ownership and have eliminated exploitation; therefore, the new labor value created by workers in part belongs to the individual and in part is handed over to the state through taxation or profit delivery. Furthermore, the portion received by the state, in addition to being used for expenditures on public works, is also used for construction. Some of it is also used as the social welfare reserve fund, etc. to benefit all working people. Therefore, in general, workers all work for their own sakes. However, first deductions must be made in the process of distribution. This is called the first distribution in political economics. Then, the state and the enterprise must carry out redistribution. The enterprise collective has supplied society with labor and after making deductions the remainder should be in proportion to the size of the labor contribution. Similarly, it should embody the principle of more gains for more work and fewer gains for less work. Following this, the second distribution is carried out within the enterprise from small collectives down to individuals.

What does this aforementioned portion of labor owned by enterprises refer to? We say that the more the state takes in, the more the enterprise retains and the more the individual receives. Does the portion that is "retained" in the profit retention currently in effect refer to this distribution discussed above? No. The "retention" that is currently in effect includes production development funds, collective welfare funds, bonus funds, etc. Of these, only the portion which may be directly converted into individual worker or collective expenditures is the aforementioned distributed portion. Moreover, wages which are not included in retention also come under the distributed portion mentioned above. At present, when we speak of profit retention, profit contracts, etc., we often simply say that the share retained by the enterprise is enterprise "profits." This is a vague and ambiguous concept. Many contradictions currently exist in the retention system and I believe this is strongly related to the confusion over this concept. Only by clarifying distribution relationships in theory is it possible to resolve these contradictions in the retention system.

As all those who have studied political economics know, in Marx's analysis of capitalist commodity production he divided commodity value W into c, v, and m. c represents materialized labor, that is, the depreciation of equipment, raw material compensation, etc. Thus, this is the reflection of previous labor in product value. At present new labor is broken down into two parts: One part is called v and it refers to workers' wages. Capitalists exchange this with workers according to the value of the labor force. The rest is known as profits and it is the surplus value that belongs to capitalists. The value of a commodity is generally made up of these parts. We currently have a socialist system and naturally we cannot continue to use these concepts, but numerous accounting methods actually continue to use this formula. For example, in computing the cost of production, c and v are still added to determine cost; thus cost includes wages. The remainder m, what we call profits, in the past belonged to capitalists, but no longer. Prior to system reform this portion was basically handed over to the state. In order to make a distinction from capitalism, the definition has been changed somewhat. We define v as "labor on behalf of the individual" and m as "labor on behalf of society." In reality we have not resolved the problem of making an essential distinction. With system reform contradictions have appeared and m has had to be divided up: part goes to the state and part is retained by the enterprise. So, is the part retained by the enterprise "labor on behalf of the individual" or "labor on behalf of society?" It is hard to say. c, v, and m are all economic categories of capitalism that cannot be fully and indiscriminately applied under a socialist system. If we apply them, their meaning changes completely. Some comrades have raised a question: Does the economic responsibility system that is currently in effect involve distribution according to "labor" or according to "profit?" This question is appropriate. The contradiction is in the word "profit." Below I will discuss my own views.

We still use the term profit but its meaning certainly differs from capitalist profit. In implementing profit sharing part is given to the state and part retained by the enterprise. If we were to apply the old concepts, m would be divided into two parts. One part, m_1, is assigned to the enterprise and one part, m_2, is delivered to the state. For example, the state gets 90 percent and the enterprise 10 percent. However, there are many ambiguities here. If we take out part of m_1 retained by the enterprise for bonuses it changes into v. If still another part is taken out for the production development fund to carry out excavation, renovation, and transformation, it becomes a fixed asset and changes into c. Therefore, the concept behind m is very vague. We now have to study distribution according to labor. What actually is the amount of "labor" produced by an enterprise? How much is to be "deducted" for the state? How much remains after deductions? It is difficult to answer these questions using c, v, and m. Is the part remaining after deductions m_1? No. v is also the part acquired by staff and workers. As we currently carry out distribution according to labor can we only focus on v and only focus on wages? No, that is not possible. The more I work the more I earn, and if the enterprise is successful, it may redistribute some earnings so once again I may gain some advantage. However, when calculating cost, wages are fixed and unchanging. In Sichuan there are some plants that are implementing substituting taxes for profits. They have taken a step forward and included wages and bonuses in profits. I think that they have actually found a practical way out. In this approach a new cost concept arises. Cost is primarily c; that is, after compensating for consumption of fixed assets, raw materials, and other materialized labor, the remainder is "net output value." When there are rational prices net output value may reflect the new value supplied by an enterprise to society. If we continue to use the categories of c, v, and m, then net output value equals v + m, and if we add national net output value, it equals national income. National income also includes v and m. This kind of differentiation should first be made conceptually. Then the state must carry out distribution among enterprises. In terms of the categories of c, v, and m, m may represent the part distributed to the state. It should include taxes and profits and because of this, it is not wise to call m profits, rather we should call it national income. v then is enterprise income but it refers to the gross amount of the expenditure reserve fund which is converted into expenditures of staff and workers. It includes wages, bonuses, and various welfare expenditures but excludes the welfare construction fund, i.e., hostel construction. It is still a fixed asset of the state enjoyed by staff and workers but it does not belong to staff and workers, so it requires separate handling. This v is a new concept. Under a capitalist system v refers to wages and is determined by the price of the manpower market. The market price fluctuates, sometimes it is high and sometimes low. When the market is thriving, workers are not easy to find and the cost of labor is very high, but when there is a slump, more and more workers are unemployed and labor is cheap. However, in overall product value, since v is like c in that it is a constant amount, it can be compared to raw materials. Its price may rise or fall. But, as a relatively constant factor included in cost, the remaining surplus value m is all considered v. The situation is different under socialism. v should not be a constant amount. Since our workers are not employed workers, manpower is not a commodity. v is self-produced and after the value produced is deducted according to a certain proportion, the remainder is distributed to individuals. Only in this way is it possible to conform to the principle of distribution according to labor. The amount of labor provided to society is v + m and, after deducting m, the remaining v is recovered. Therefore, when I work well v is large and when I work poorly v will be small. This kind of distribution is distribution according to labor not according to profit.

We are now implementing enterprise profit retention. The part retained is not completely for individual consumption. A large part of it is used to expand reproduction and increase welfare facilities. This part is not v, it is still owned by the state. The enterprise only has allocation rights, not ownership rights. At present this concept is vague. That part that is retained includes both the funds for individual consumption and the part retained for expanding reproduction and welfare facilities. Both are considered enterprise profits. Not only is this inconsistent with the concept of distribution according to labor but it also contradicts the essence of the system of ownership. After implementing profit retention the fixed assets formed by the establishment of the production development fund, known as enterprise "independently controlled capital," have increased over time. What system of ownership do we have? If this capital is handled in such a way, there will be problems in the long term and in the whole social system. The production development fund is to be allocated by the enterprise but the fixed assets still belong to the state. In reality, it is redistribution of state income m. Part of state income m goes for expanding the accumulation of reproduction, namely, the capital construction fund. Part of this fund may be handed over to the enterprise which can make allocations for utilization. The amount distributed by each enterprise may be related to enterprise business results but it is not considered v in enterprise loans. The part of the collective welfare fund that is used for construction of welfare facilities (such as construction of hostels, hospitals, etc.) is also the redistribution of state income m which is used for welfare construction funds. Part of this is handed over to the enterprise which can make allocations independently. Once construction is completed it still belongs to the state but is used by the enterprise. Moreover, there should be utilization with compensation, that is, a hostel must pay in depreciation to the state. As for enterprise housing subsidies for workers, that is considered a welfare expenditure and comes under the category of v. Based on the principle of distribution according to labor, v refers to what is really owned by enterprise workers, that is, v is the means of subsistence or labor services that may be distributed to individual workers or for collective enjoyment. It is this part that is the true profit of enterprise staff and workers. The rest still comes under the category of "deductions" and not under the category of distribution according to labor. Such questions of theory require accurate answers.

Precisely because there are such views as the ones mentioned above, I developed a view of two levels in distribution according to labor; that is, in distribution according to labor there must first be distribution based on the enterprise and then distribution based on the individual.

III. Distribution According to Labor Within an Enterprise

Distribution within an enterprise involves the overall wage system; it is an extremely complex problem. I am really not qualified to discuss how to reform the wage system, I can only present my views concerning the principle of distribution according to labor.

Based on the principle discussed above, in distribution according to labor it is first necessary to carry out distribution to enterprises. This means that after deductions are made from the newly added labor of enterprise workers, the remainder should become enterprise income. This income (v) belongs to all staff and workers in the enterprise. It is equivalent to the net output value of the enterprise. The nature of the amount remaining after subtractng taxes and profits handed over to the state differs from the concept of the wage system currently in effect. It consists of the enterprise expenditure reserve fund and includes the entire means of subsistence (or labor services) which can be used by individual workers or the collective.

I believe that in the restructuring of the wage system it is not only necessary to look at wages, bonuses, and other concepts currently in effect, but comprehensive consideration must also be given to how to carry out distribution of this "enterprise income" within an enterprise.

The 3d Plenum of the 11th CPC Central Committee raised the matter of system reform, and during the past several years of actual practice enterprise autonomy has begun to expand. I believe that this step is correct. The enterprise is not only a place where productive forces directly exercise their functions, it is also the concrete manifestation of production relations. If we say that the chief characteristics of socialism are the system of public ownership and distribution according to labor, then these two characteristics are both reflected in the economic cell known as the enterprise. Of course, system reform should consider this as its basis, define its characteristics and its active model, and then proceed from this basis to establish a completely corresponding higher level and a system of macroeconomic control.

What is the nature of enterprises under a socialist system? There has been a major theoretical breakthrough after these past 2 years of investigation: It has been recognized that socialism still needs commodity production under a planned economy. Consequently, a socialist enterprise inevitably comes under the guidance of a national planned economy with relatively independent commodity producers. The term "relatively" is the key word here. Our enterprises differ from those under capitalism, which possess absolute independence. Relative independence means that an enterprise can only exercise independent management, independent accounting, and assume responsibility for profits and losses within the sphere permitted by state laws and under the guidance of state plans. The chief point about relative independence is that it has relatively independent economic benefits.

How are the relatively independent economic benefits expressed in concrete terms? During the experiment of system reform the methods of profit sharing, profit contracts, etc. were adopted. But, just as I mentioned earlier, due to the influence of outdated concepts, these methods failed to clearly distinguish the limits of the relatively independent economic benefits of enterprises. Only by implementing distribution according to labor in enterprises is it possible to clarify this problem. The so-called relatively independent economic benefits refers to the newly added labor created by enterprises under conditions of rational pricing. It is distributed between enterprises and the state. The part retained by the enterprise must be in proportion to its collective labor contribution. If the results of enterprise production are good, the enterprise will receive comparatively higher profits. This is the principle of distribution according to labor, more work more profits, less work fewer profits, and no work no profits.

As for how this share of income received by the enterprise should be distributed within the enterprise, normally the enterprise should have total autonomy. Nevertheless, socialist enterprises are not absolutely independent. Even with distribution within an enterprise it is still necessary to implement some centralized state regulation such as unified wage standards formulated by the state. However, there must not be excessive state intervention. Enterprises should decide on wage scale assessments, increases, decreases, bonuses, or bonus sharing.

Concerning the implementation of distribution according to labor in enterprises, the state has stipulated the proportion of enterprise income and state income in net output value. There is no need for the state to once again directly control an enterprise's gross wages and total amount of bonus money. The state must control the proportionate relationship between consumption and accumulation of national income and primarily regulate the proportion of enterprise income and state income. Once this proportion has been set, the relationship between the amount of enterprise income and the amount of labor supplied by the enterprise to society should be such that "when the river rises the boat goes up" and "when the river subsides the boat goes down." Only in this way is it possible to motivate enterprise initiative.

In the implementation of two levels of distribution according to labor, namely, distribution to enterprises followed by distribution to individuals, the difference between this and the earlier form of distribution according to labor only to individuals is that the amount of income of an individual worker is not only determined by the amount of individual labor expended but, above all, by the amount of enterprise income.

Not all enterprise income is distributed to individuals according to labor. Part of it goes for collective welfare expenditures such as housing subsidies, subsidies for children, medical expenses, financial aid, etc. This is not considered distribution according to labor, but every worker has the right to these benefits. Enterprise workers should determine of their own accord the proportion of enterprise income that these expenditures should constitute as well as which welfare services should be undertaken.

Besides paying for collective welfare expenses, the part remaining is the part directly distributed to individual staff and workers. The problem at present is how to distribute this amount on the basis of labor. Personally, I believe that the distribution of this amount within an enterprise should in principle first proceed with distribution to small collectives (workshops, teams and groups, administrative offices, etc.) and then with distribution to individuals, or we may consider combining the two. Why should this method be adopted?

First, even within an enterprise it is very difficult to measure the amount of labor totally based on individual work conditions. At present most people think that it is possible to solve this problem by setting an average advanced labor standard within an enterprise. Those who have done actual work in setting standards know that the problem is not that simple.

There are two situations in which it is relatively easy to set standards: One is labor which is simple, isolated, and highly repetitive. Take for example goods of a certain weight which must be transported using physical strength. Only one article can be carried at a time or one package moved at a time, yet because conditions in transportation distance and stacking requirements may differ, it is very difficult to make accurate measurements. Nevertheless, general measurements can be made. Another is highly mechanized and automated production such as automated production assembly lines that move rhythmically. Standards for the production lines are basically predetermined by technical equipment. Moreover, although standards may be set for all production or work positions which rely on the joint collaboration of numerous parties, there are still many factors that influence meeting these standards. Thus, the quality of fulfillment is often not totally determined by the individual worker in this position. If a metal axle goes through the two processes of turning and grinding, the yuliang [5940 6852] remaining after turning may be determined by tolerance, but if it exceeds or falls short of the yuliang, the impact on the grinding process may be great. If there is a lot of yuliang left over from turning, it will be difficult to meet standards in grinding and vice versa. Whether or not the lathe and grinder work well also affects the fulfillment of standards. This is also determined by the cooperation of machine repair workers. Problems such as these are numerous. Thus, when setting rational standards, it is of course possible to easily measure individual labor, but there will be disputes on many occasions and it will be very difficult to be absolutely accurate.

Second, lots of labor and work goes on in enterprises and it is not possible to set individual standards. First, it is frequently very difficult to set production standards for auxiliary or service labor. Second, collective operations such as smelting do not involve assembly lines. If there are to be standards, they must be collective standards. This holds true for automated production lines. Finally, there is also technical work and management work for which it is even more difficult to set individual labor standards. Along with the growth of modernized production, the first line of production workers will decrease while second and third line workers will increase. This means that the proportion of mental workers will grow larger. However, it is difficult to use standards to measure individual mental labor.

Third, in large-scale socialized production the labor expended by an individual does not necessarily constitute effective labor. A machine consists of numerous component parts. If everything except one part is completed, this machine cannot be completed. A spare part must go through numerous work processes, and even if quality standards are met in the early processes, it may be rejected in the final process. Thus, the early work processes all carry out "empty work." We who are concerned with piecework wages have all had this experience. When piecework is very much above quota, above quota wages are issued but production tasks may still not be completed. Furthermore, simply measuring individual labor without considering collective results will inevitably lead to individual producers only considering individuals, and overlooking the collective effort and not caring about collective results.

Putting the small collective first and the individaul second is, of course, a principle. There are still many problems in putting this into actual practice. It is said that the Soviet Union is currently engaged in wage reform. They have decided to widely promote the "work team (or section) wage system." This is also a method of small collective remuneration. While implementing the system of economic responsibility, our enterprises have had numerous experiences in remuneration to small collectives according to labor. The major part of it has consisted of bonuses, and the method of collective bonuses has been adopted. Methods such as collective piecework, collective above quota piecework, and other methods including wages have been adopted. Some invented the method of both considering the individual and the collective such as the "work point system" in which work points are calculated according to the amount of individual labor and the value of points is calculated according to collective results. The Liaoning Machine Plant in Guangxi tried a method in which it is determined that every month each person must complete a certain number of man-hours. Upon completion the worker receives the basic wage. For every hour above this number he is rewarded with 1 jiao and for every hour below the expected number of man-hours 1 jiao is deducted. At most only 10 percent of the basic wage may be deducted but there is no ceiling on surpassing the quota. If every worker in the group fulfills his tasks and surpasses his quota of man-hours, they all receive 1 jiao and 2 fen for every hour. If the group fails to complete its tasks each person who surpasses the quota only receives 1 jiao. If the entire workshop completes its tasks each individual receives 1 jiao and 5 fen per hour worked above the quota. If the workshop does not complete its tasks but a group does, the individuals in this group will receive 1 jiao and 2 fen per hour. In this way the individual and the collective are linked, and it is reported that results have been good. Such fine methods as these may be gradually put into practice.

As for distribution according to labor within an enterprise, the advantages of putting the small collective first and the individual second or integrating the collective and the individual are that it is fairly easy to measure labor results and to promote individual concern for collective results. However, whatever method is adopted must reflect the principle of distribution according to labor, and ultimately it is still necessary to carry out distribution to individual staff and workers.

Distribution according to labor to individuals is quite complicated. Distribution according to labor to enterprises and collectives basically uses labor results as distribution criteria. In distribution to individuals, besides primarily using labor results as distribution criteria, it is also necessary to consider numerous other factors. First of all, individual labor may be divided into active labor and potential labor. Active labor is manifested in labor actually expended in the production process while potential labor is the labor capacity of workers which is often not developed because of nonworkers. For example, if we let high level skilled workers do low level work the quality of their work will not be developed, or, if poor production organization causes workers to be idle, then labor, in terms of quantity, may not be fully tapped. In carrying out remuneration to individuals according to labor we cannot only measure active labor actually expended, it is also necessary to be compensated for potential labor. Next, due to disadvantageous labor conditions, the extent of the responsibility undertaken and political encouragement, there must still be compensatory remuneration such as night shift compensation, duty compensation, factory age compensation, local subsidies, etc. In addition there is also remuneration having to do with welfare and social insurance such as disease, injury, and maternity leave wages, wages for those released from work for study, etc. Thus, various methods must be adopted for distribution within an enterprise to handle these different forms of remuneration so as to motivate the production labor of workers and initiative in other areas.

In implementing the principle of distribution according to labor, it is necessary to oppose egalitarianism and overcome the phenomenon of eating out of the "big pot." As for implementing distribution according to labor in enterprises, it is possible to overcome the problem of eating out of one "big pot" among enterprises and under this premise overcome the problem of eating out of one "big pot" within an enterprise. For many years, due to "leftist" errors the principle of distribution according to labor has been undermined. In addition economic difficulties have led to numerous problems in current workers wages which do not correspond to distribution according to labor. Although there have been readjustments of wages over these past few years, the irrational conditions formed by history cannot be rectified in one fell swoop. After carrying out system reform the bonus money used to readjust worker income will play a significant role in motivating worker enthusiasm. But, just as mentioned above, the factors that must be considered in distribution according to labor to individual workers are complex, and it is certainly impossible to resolve complex contradictions by relying entirely on the use of bonuses for readjustment. Thus it is necessary to consider the reform of the entire wage system.

In brief, the broad sense of the word wage includes various forms of remuneration to individual workers. Therefore the term "wage system" should be changed to "labor remuneration system" as the meaning is even more precise. However, some socialist nations such as Yugoslavia regard "wages" as a capitalist category that should not be used. The term "remuneration" is also inappropriate, since it is difficult to determine who provides remuneration of labor income created by workers themselves. This view is reasonable and we must not regard this as an unimportant matter having to do only with terminology. Since a name is a concept it should accurately reflect the substance of the meaning. Thus "worker income distribution system" is even better than "labor remuneration system."

I believe that two problems must be resolved in the reform of the worker income distribution system.

First, when clarifying and determining enterprise worker income, which form of income should it be divided into? What are the essential characteristics of each form of income? For which form of income must there be national standards?

In terms of the direction of reforming the entire economic management system, the kinds of enterprise worker income may generally be divided into the following several broad categories:

1) Basic income (basic wages). Different grade standards may be set according to type of work, work capacity, and degree of proficiency. If piecework wages, duty wages, position wages, etc. are used, provided that

the work duty or position is at the grade requested by staff and as long as they are competent, in principle they should receive the income of this grade standard.

2) Supplementary income (supplementary wages) which includes various kinds of compensation and subsidies.

3) Bonus income (bonus money). At the present time bonus money is treated as compensation for above-quota labor. It is very difficult to accurately control. Above-quota labor should be handled as part of basic income (basic wages). For instance, when practicing piecework or above-quota piecework, the adjustment of the amount exceeded or the amount deficient is simply a fluctuation of basic income. There must still be bonuses which should act as encouragement for individuals to make outstanding contributions (such as inventing new things, winning competitions).

4) Bonus sharing income. This is a benefit individual workers receive from collective results. It may simply be distributed (year-end bonus sharing) or it may be reflected in basic income. (For example, in the work point system collective results are reflected in point value.)

Second, we must clearly determine the division of the limits of the authority of the state and enterprise to distribute income to workers. The state should centrally determine the worker income distribution system, related policies, basic wage grade standards, the kinds of supplementary income and related provisions, general provisions on bonus sharing, etc., which must be implemented by all enterprises.

In the implementation of the two levels of distribution according to labor, after enterprises have paid in taxes and profits to the state according to a specific proportion, the part that remains is considered enterprise income. This proportion of this income in net output value is determined by the state. The enterprise obtains the whole expenditure reserve fund according to provisions. The enterprise should determine independently how to redistribute this expenditure reserve fund within the enterprise. Under the premise that the form of distribution of basic income (the hourly work or piecework form of distribution, position wages, duty wages, etc.) as well as the right to determine the grade and the time and extent of the promotions and demotions of each worker according to the determined grade standard. The enterprise has the right to determine the kind of enterprise supplementary income and the scope of application according to relevant state provisions. The enterprise has the right to give bonuses to workers and implement bonus sharing according to state provisions. Although the enterprise has this authority, it must still comply with central state regulations. Moreover, this authority is to be exercised within the limited amount of enterprise income. Thus, this authority is only a relatively independent kind of self-determination. Once an enterprise has this autonomy it can rely on the democratic management of staff, workers and the masses to rationally distribute enterprise income using various means (not only bonus money) to individual workers. In this way individual income is not only linked to individual labor contributions but also the production results of the entire enterprise.

Now I will briefly discuss several problems regarding distribution within small collectives.

I advocate distribution within an enterprise which in principle means that there should first be distribution to small collectives and then distribution to individuals by small collectives. This principle has already been discussed above. I once said in an article in RENMIN RIBAO: If we practice distribution according to labor among enterprises and among small collectives within an enterprise "after resolving these two kinds of egalitarianism, even though some egalitarianism may exist within small collectives it will not affect the situation as a whole; there may even be some advantage." This provoked some argument. Some comrades believed that since egalitarianism is bad, egalitarianism should not be allowed within small collectives.

At that time I was referring to living wages (bonuses, bonus sharing, etc.) and the distribution of this income. I believe that if basic wages can embody distribution according to labor and if differences between individuals already exist, living wages other than basic wages, particularly collective bonuses distributed to small collectives, must also be distributed correctly according to labor within small collectives. It is often very difficult to implement greater bonuses for more labor. Therefore, I advocate that this income may be distributed relatively equally. This so-called relatively equal distribution means that for the most part equal distribution is carried out, except for striking cases of those who work much more or much less. Such circumstances can be seen in actual experiences. For example, in the past all bonuses were divided into first class bonuses, second class bonuses, and third class bonuses. Rigid rules governed how many people got first class bonuses and how many got second class bonuses. Groups and teams had no way to decide on bonuses. Why? This was because in many circumstances it is not easy to accurately measure labor contributions. Of course, if there is a precise quota then it is possible to adopt the method of above-quota bonuses, but that too does not require bonus evaluation.

In addition, I also suggested that distribution within small collectives "might as well be democratically decided within small collectives." Some comrades believed that this "democratic decision" was "democratic determination." I did not have that in mind. A democratic decision means that the method of distributing this collective income need not be rigidly determined by higher authorities. The method of distribution may be democratically formulated internally. There is one major argument in favor of my view and that is that doing things in this way will help strengthen the collective consciousness of workers.

Foreign countries emphasize the application of "behavioral science" in enterprise management. Under a capitalist system, the study of behavioral science proceeds from the interests of the bourgeoisie to seek methods for controlling the behavior of the individual worker and collective behavior. Can the principles and methods of this science be applied in socialist enterprises? At present there is some controversy over this, I believe that there is much we can make use of. For instance, behavioral science stresses the formation of collective consciousness. Under a capitalist system, labor and capital are basically antagonistic so it is impossible to truly form a collective with uniform interests. But they make use of certain methods of behavioral science which really play a role in strengthening cooperation. Under our socialist system workers are the masters of the enterprise. It is appropriate and necessary to advocate collectivism and develop collective consciousness. Consequently, not only can we apply certain methods of behavioral science concerning strengthening collective consciousness, but only in socialist enterprises can their role be fully developed. Although many of our advanced teams and groups do not know about behavioral science, they nevertheless have had many useful experiences in strengthening cooperation and developing the spirit of collectivism. For instance, the collective consciousness of some teams and groups is strong. In handling the distribution of bonuses they do not simply follow the stipulations of higher authorities but rather adopt some flexible methods within the teams and groups so as to embody collective mutual aid. For example, higher authorities stipulated that a worker who was absent a certain number of days per month should not receive a bonus and that a worker who requested several days off for marriage certainly should not receive a bonus. The team leader recalled that this comrade was usually very active and since marriage is a joyous occasion, for him not to receive a bonus would be unkind. Therefore, he encouraged comrades in the team to work his shift and with the help of the night shift they completed his quota for him so that he was given a bonus. This comrade was, of course, very moved, and after returning to work he was an even better worker. There was one female worker whose skill level was low. She frequently failed to complete her quota. Not only did she not receive a bonus, but she influenced the completion of the whole group's tasks. They tried to give her the easiest work and help her improve her skill level so that she gradually caught up with the others. There was also a young worker who was overly fond of playing. When he was on duty he would go to see movies, which affected completion of his tasks. The team leader and other comrades worked overtime to help him complete his tasks so that he received a bonus, but they also severely criticized him. This young worker accepted the criticism and felt the team leader's warmth and gradually changed his work attitude. Practices such as these are not all handled strictly according to the principle of distribution according to labor; however, the collective consciousness in small collectives is raised and the initiative of each individual is motivated. Thus, I advocate that certain forms of distribution within small collectives may be determined by the small collective itself. The masses may also have methods which can rationally and successfully deal with such problems.

IV. The Principle of Comprehensive Material Benefits

Last of all I will briefly discuss implementing the principle of comprehensive material benefits. In terms of the concept, the significance of the principle of comprehensive material benefits is greater than of distribution according to labor. The original intention of the principle of material benefits was to make workers concerned about the growth of production from the angle of material benefits. It was meant to link the individual interests of the worker with production results and thereby make him integrate his concern for his own vital interests and production results. If production results are good, this benefits the state, the collective, and the individual worker. Of course, distribution according to labor may also have this effect. However, under a socialist system the improvement of the individual's vital interests is not necessarily the result of this individual's labor; there may be other causes. Once overall national economic conditions have improved it will be possible to provide advantageous conditions for improving individual benefits. After system reform the quality of enterprise production operations will determine enterprise income. It is the prerequisite for improving the individual benefits of workers. Thus not only is it necessary to make workers understand in principle the existence of ties of common interest between individuals, enterprises, and the state, there must also be actual links so that they feel directly the effect of these ties in their actual interests. Consequently the principle of comprehensive material benefits means that in the distribution system it is necessary not only to link up the interests of individual workers with individual labor contributions but also with collective results. It should also be directly linked up with the successes of national economic development. This is the principle of comprehensive material benefits.

If individual interests are only linked to individual labor then the principle of comprehensive material benefits means only being concerned for individual labor results for the sake of individual interests. It would be impossible to guide workers to care about the collective or the state. This is the principle of noncomprehensive material benefits. Some comrades disagree with my view. They say that when implementing piecework wages and other methods of distribution according to labor, worker effort improves productivity. Objectively, the worker both creates benefits for himself and for the state. One cannot say that he is only thinking of his own interests and forgetting those of the state. I believe this view is not very realistic. In real life things are not actually like this. Of course there are many workers who, because of our ideological and poliical work and inspiration in other areas, may be concerned with collective and state interests of their own accord. Yet, one cannot deny that today the level of awareness among workers is not uniform. Quite a few workers still do not consider collective and state interests in all respects. Without doubt ideological and political work is extremely important and is a major task of top priority today. Educating the broad masses of workers to correctly understand the connection of interests between the state, enterprises, and individuals is a central task of ideological and political work. Nevertheless, in an economic system it is also necessary to have links of interest that can be seen and felt. Only then is it possible to make each worker directly feel that his own lot is connected to the collective and the state.

Formulating our distribution system according to the principle of comprehensive material benefits should make the worker see clearly the channels from which his individual benefits derive. First, as the national economy develops, what benefits will he receive directly? This requires that we carry out reforms in the system. As discussed earlier in distribution according to labor, it is first necessary to make some "deductions" which means paying in a certain amount of taxes or profits to the state. The state then redistributes this income. One part of it is used for state management expenses, key construction investments, etc., which are also in the workers' interest. However, these are indirect, not direct, benefits. Another part is for direct benefits, primarily for social welfare undertakings or for social insurance. Enterprises are responsible for the labor insurance currently in effect, free medical service, etc. Workers do not realize that these benefits come from the state. Since so much money is expended in this way, why is it not possible to hand it over to the state and once again, in the name of the state, have the state assume responsibility? If retirement and old-age pensions, free medical treatment, unemployment insurance, health care and convalescence, subsidies for children, etc., are all directly managed by the state, they will become state social welfare undertakings or social insurance undertakings. Then national economic plans will clearly define targets and after fulfilling these plans it will then be possible to start welfare undertakings or to raise the standard of retirement funds, etc. In this way workers can see the direct link between individual interests and national economic development and thereby become concerned about fulfilling state economic plans. There is a so-called "welfare state" under capitalism which does much work in this way. Socialist nations should follow suit. At present money is often spent in a similar fashion yet workers have not felt that this is a benefit provided by the state. Furthermore, we have in reality paid out numerous subsidies to workers. If rental charges are low, then in reality there are large subsidies, yet workers are not aware that this is a benefit provided by the state. Therefore, system reform should clearly acknowledge these benefits for workers. Take housing for example. Charges should be based on actual value and then the standard for housing subsidies set. Not only will this make workers aware of their benefits; it may encourage them to economize on housing. As for readjusting wages, if distribution according to labor is implemented to enterprises, the state may have no control over when readjusted wages will be delivered. However, based on the state of economic development, the state may unify and improve wage standards and include it as an item in national economic planning. Thus, even though workers do not get promoted they may still receive increased wages. In this way they will come to understand that the more national economic construction develops, the greater the advantages to the individual. For example, if the 5-year plan requires that the retirement fund be increased a certain amount, even if the worker has not yet reached retirement age he will realize that as national economic conditions improve, both the working people and he himself will benefit. This will further encourage the masses to be concerned about the progress of national economic construction. This is one channel for worker benefits, and it is necessary to adopt measures to clarify this channel.

The second channel is to obtain individual benefits from enterprise collective results. One way is to obtain benefits through enterprise bonus sharing and the other is from enterprise-run welfare undertakings.

The third channel is the influence of the results of small collectives on individual benefits. This includes adopting collective remuneration, collective bonuses, or collective bonus sharing.

Finally, there are benefits obtained through improving the "quality" and "quantity" of individual labor. This is the major source of individual benefits. Workers may upgrade their work capacity through self-study of training. If their attendance rate, work efficiency, and work quality are high, if they practice strict economy and take on much responsibility or if they are creative and inventive, they may receive even more income.

By clearly differentiating the sources of individual worker benefits into the above four channels it is possible to resolve the relationship of actual benefits between the state, enterprises, and individuals. In addition, with frequent ideological and political instruction not only is it possible to strongly motivate the initiative of workers and the masses but also to establish a material basis for cultivating collectivist ideology and for recognizing the superiority of the socialist system.

In order to implement the principle of comprehensive material benefits in this way, we must give overall consideration to the restructuring of the distribution system during the reform of the economic system.

6. The Leadership System in Socialist Enterprises [pp 295-308]

[Text] [Editor's note] This article was published in HONG QI [RED FLAG] No 21, 1980. [End editor's note]

I. Reform of the Economic Management System Requires Reform of the Leadership System Within Enterprises

The reform of the economic management system is a major part of China's current economic reform. System reform refers primarily to how to change the form and methods of state organizational leadership of national economic activities throughout the country according to objective economic laws. Actual practice and theoretical investigation over the past 2 years have shown that the key to system reform lies in correctly handling the relationship between the state and basic level economic units. This requires that we start by establishing and expanding enterprise autonomy. The rationale behind this approach is very simple: a socialist economy is still a commodity economy and a socialist enterprise inevitably possesses the general characteristics of commodity producers. It is the basic unit of national economic activities and it is the basic level unit directly engaged in production and circulation. Under the unified leadership of the socialist state, it must be relatively independent, it must be able to operate and develop independently, and it must have independent economic results. Only in this way can an enterprise become a dynamic organism, fully develop its positive initiative, and become a source of national economic strength.

Socialism is far superior to capitalism in that socialism practices the system of public ownership and has eliminated exploitation. Workers have become the masters of production and work for their own benefit. It is thereby possible to develop great labor initiative and creativity. The basic characteristic of a socialist economy is the implementation of socialist democratic principles in the economic sphere. The growth of independent initiative in enterprises under unified state leadership is the concrete manifestation of a socialist economic democracy. Nevertheless, enterprise initiative in the end still stems from the initiative of enterprise workers. Thus, it is not enough to merely embody principles of socialist economic democracy in the establishment and expansion of enterprise autonomy; they must also be embodied within enterprises. It is necessary to practice true democratic management and to enable workers to really be their own masters so that their infinite intelligence and wisdom can burst forth.

The ideas of Marx and Engels concerning the association of free and equal producers should become our theoretical basis for establishing a socialist economic management system. Marx pointed out: "The national centralization of the means of production will become the national basis of society and it will be composed of the association of free and equal producers. These producers, according to common rational plans, will consciously be engaged in social labor." (Footnote 1) ("The Nationalization of Land," in "Selected Works of Marx and Engels," Vol 2, People's Publishing House, 1972, p 454)

Engels said: "The most important commune law stipulates that it is necessary to organize large industries and workshop handicrafts. This organization should not only regard the association of workers as the basis within each factory but should also combine all these associations into one grand alliance. In short, just as Marx correctly pointed out in 'The Civil War in France,' this kind of organization must, in the final analysis, lead to communism." (Footnote 2) ("Introductory Remarks to the 1981 Edition of 'The Civil War in France,'" in "Selected Works of Marx and Engels," Vol 2, People's Publishing House, 1972, pp 333-334)

According to the above mentioned economic organization under the system of public ownership envisaged by Marx and Engels, there are two main points. First, each enterprise should be an association of free and equal producers, that is, enterprise production workers should democratically manage the enterprise. Second, the overall national economy should be a grand alliance consisting of many equal and independent enterprise associations. These two associations reflect the high degree of democracy inherent in implementing a socialist economy with a public ownership system.

China's current system reform affirms proceeding from expanding enterprise autonomy and recognizes the relative independence of enterprises. It promotes a voluntary alliance between enterprises and, in essence, is heading toward becoming a "grand alliance" as mentioned above. Once enterprises have autonomy, the next step is to resolve who exercises this autonomy and how it is to be exercised. This involves the leadership system in enterprises. Without question, it is necessary to implement socialist democratic principles within enterprises and make enterprise associations of free and equal producers. Only then will it be possible to coordinate those within and outside of enterprises to form an integrated management system that embodies democratic socialist economic principles.

II. The Enterprise Leadership System Currently in Effect Cannot Conform to the Demands of System Reform

The production enterprise, as the basic socioeconomic unit, directly gives rein to production forces and directly embodies certain production relations. The enterprise leadership system is the core of the enterprise organizational structure. On the one hand it must conform to the objective demands of organized production forces and large-scale socialized production. On the other hand, it must also play a role in preserving certain social production relations.

Historical experience has shown that the leadership system within an enterprise involved in implementing effective management of a modern enterprise may roughly be broken down into three functions, namely, policy-making authority, command authority, and supervisory authority. Policy-making authority refers to the power to make decisions on the direction, policies, and certain major measures regarding enterprise production operations. Command authority is based upon existing policy guidelines and refers to administrative leadership in day-to-day enterprise production activities.

Supervisory authority proceeds from the rights and interests of enterprise owners and involves comprehensive supervision of enterprise policymakers and directors. Once there is both separation of these three functions and checks and balances, it is then possible to protect the rights and interests of enterprise owners and, at the same time, ensure the management efficiency essential to modern enterprises.

In capitalist enterprises, capitalists and their agents are in control of these three functions. In general, the board of directors consisting of capitalist (shareholders) representatives exercises policymaking and supervisory authority. Or, the board of directors exercises policymaking authority while another body, the board of supervisors, exercises supervisory authority. The chairman appointed either by the board of directors or the board of supervisors exercises command authority.

The leadership system in socialist enterprises still may be and must be divided into these three categories: policymaking authority, command authority, and supervisory authority. The difference is that these three functions are subordinate to the workers.

The leadership system currently in effect in China includes the plant manager responsibility system and the staff and workers representative assembly, both under the leadership of the party committee. Whatever problems exist in actual practice, when analyzing the system itself there is still separation of the three functions: the enterprise party committee exercises policymaking authority, the plant manager (director) exercises command authority, and the staff and workers assembly exercises supervisory authority. Many years of actual experience has demonstrated that numerous contradictions exist in the implementation of such a system and even more problems exist in the future reform of the system.

First, the enterprise is an economic organization and the party committee is a political organization. These are two completely different kinds of organizational systems. Socialist economic construction should be led by the political party of the proletariat. This is an unwavering principle. However, party leadership does not necessarily adopt the method of administrative leadership. Many years of experience has shown that having the enterprise party organization function as the highest policymaking body in the enterprise has numerous drawbacks. In some enterprises the party committee must make decisions on all matters, large or small, so that the centralized and unified role of the plant manager (director) in giving orders has been eliminated. This has influenced the management efficiency essential to modern enterprises. The party committee frequently substitutes political activities for scientific management which impedes any improvement in the level of enterprise management. At the same time, the party organization gets bogged down in administrative affairs, thereby creating the phenomenon of the party failing to manage the party which, in essence, eliminates the leadership role of the party in political affairs.

Nationally, party leadership in economic work is primarily displayed in the establishment of lines and major directives and policies. However, the actual implementation of party lines, directives, and policies must be approved by the state administrative system. Future system reform under unified state leadership must recognize the relative independence of enterprises. In managing enterprises the state must primarily adopt economic measures and decrease use of administrative measures to directly give orders to enterprises.

Under such circumstances, how can the party committee within the enterprise directly manage the enterprise? The 3d Plenum of the 11th CPC Central Committee suggested earnestly redressing the lack of separation between the party, the government, and the enterprise and replacing the government with the party and the enterprise with the government. This is a significant policy for correctly overcoming a major flaw in our system. If the party committee in an enterprise still exercises policymaking authority, the party committee essentially becomes the head of the enterprise economic organization. Such an organizational structure can resolve the difficulty in overcoming the lack of separation between the party, the government, and the enterprise.

Second, a major drawback in the current economic management system is that the state directly manages the enterprise, so that the enterprise becomes a branch office of the state administrative organization. There are some corresponding areas in this organizational system currently in effect and in the party organizational system. Consequently, the enterprise, as a basic economic unit, is directly led by a party basic level organization which, in terms of organizational system, is the appropriate one. Future system reform will establish enterprise autonomy. Under the unified leadership of state economic policies, economic legislation and economic plans, the enterprise will have relative independence. It will no longer be a branch office of the state administrative system. Under these conditions the enterprise party committee becomes the relatively independent head of the enterprise. It certainly is not at the corresponding level.

Third, for many years economic responsibility has remained vague due to the fact that party committees and enterprises are two entirely different kinds or organizations. The party committee exercises enterprise policymaking authority but has no clear economic responsibility for enterprise business results. Even if a plant manager (director) accepts responsibility he has no policymaking authority. This abnormal phenomenon of "having authority but no responsibility and having responsibility but no authority" is the inevitable result of mixing two entirely different organizations. Henceforth, in system reform the enterprise is to be regarded as a relatively independent commodity producer and the relationship between the enterprise and the state is to be manifested in a relationship of rights and duties. Furthermore, this relationship must be confirmed by the state using legal means. Every enterprise with state approved registration has the legal status of a "legal entity." It must use its status as a legal entity to accept economic and legal responsibility for enterprise business activities.

If the party committee exercises policymaking authority, the party committee is bound to assume this legal responsibility. Clearly this is inappropriate.

Fourth, democratic management is the fundamental characteristic of socialist enterprises. In implementing democratic management it is necessary to carry out the principle of democratic centralism. In order to implement democratic centralism, in terms of organizational structure, it is necessary to make the functions of democracy and centralism form an internally circular and directly linked organizational system.

The party organization itself is an organizational system based on democratic centralism which has the masses of party members as its scope. The party congress is formed through elections by the whole body of party members. The party congress then selects party committees and party committee secretaries which form the democratic basis of central leadership within the party. However, can this democratic centralism within the party replace enterprise democratic centralism? Obviously not. Enterprise democratic centralism can only be established on the basis of democracy of all staff and workers in the enterprise so that the enterprise becomes an association of free and equal producers as envisaged by Marx and Engels. The current leadership system regards the staff and workers representative assembly as the democratic body of the enterprise and the party committee as the central policymaking body. Democracy and centralism cannot form an interlinking organizational system; thus it is not possible to effectively implement democratic centralism within enterprises.

Fifth, the staff and workers representative assembly is a wonderful creation of ours for implementing enterprise democratic management. Use of this organization over the years has played a definite role in developing democracy and in motivating the initiative of workers to be their own masters. Nevertheless, this role is still quite limited.

According to the current system, the staff and workers assembly is known as the organ of power in the enterprise. What powers does this organ of power possess? In general, it is stipulated that this organ has supervisory authority. Experience has shown that as a mass organization, it is difficult for the staff and workers assembly to objectively exercise effective supervision. The plant manager (director) is an executor and the areas to be supervised by the staff and workers assembly are quite limited. Consequently, it is not surprising that a situation has developed in which "the party committee issues appeals, the plant manager makes reports, representatives vote, and labor unions play a minor role." This kind of democratic management cannot fully motivate the initiative of the broad masses of workers to be their own masters. The creation of such a situation does not depend on who has done well or poorly but rather on the inadequacy inherent in the system itself.

Sixth, any modern enterprise must have strong centralized and unified direction in day-to-day production operations; that is, it is necessary to implement a single-head system. This is an objective requirement of large-scale socialized production. Marx, Engels, Lenin, and other Marxists have written scientific analyses confirming this.

In modern enterprises, policies are collectively made but it is necessary to implement adherence to unified centralized direction. In the past we criticized the "single-head system." This would make sense when referring to policies on major issues. Capitalist enterprises are in transition from sole proprietorship financing to joint stock partnership financial management. They have had to set up boards of directors to implement essential democratic policies. Without question we socialists should adopt democratic methods.. One person should not have final say. But, in day-to-day production operations, it is still necessary to implement a single-head system to carry out policies. The plant manager (director) must be responsible for unified centralized direction.

In the implementation of the plant manager responsibility system under the leadership of the party committee, the party committee collectively determines policy and the plant manager gives central orders. Whether or not policymaking authority should be exercised by the party committee, it is still correct that the collective principle be used in policymaking and the principle of a single-head system be adopted in providing direction. In the past we followed the "plant manager division of labor responsibility system under the leadership of the party committee." Responsibility for the daily work of enterprises was divided between plant managers and assistant plant managers; it was not centralized among plant managers. In terms of policy, some enterprises did not develop the collective role of party committees so that all problems, large or small, were decided upon by the party committee secretary. In actual practice a "single-secretary system" was formed. As a result, policymaking was not democratic and command was not centralized. This reversed way of doing things runs counter to the objective demands of large-scale socialized production in modern enterprises.

When enterprises implement democratic centralism, centralism refers to centralism on the basis of democracy. Those who exercise centralized direction have power, authority and responsibilities. They are responsible to the democratic policymaking body. However, in a rational and effective responsibility system there can only be responsibility to one authorized body. If one is responsible to multiheaded leadership, it then becomes difficult to be clear about responsibility. Plant managers (directors) under the current leadership system must be responsible to both the party committee and to the staff and workers representative assembly. This kind of system of responsibility to various bodies indicates disorder in the organizational structure.

From the above it is apparent that many contradictions exist in the structure of the system itself in the implementation of the plant manager responsibility system and the staff and workers assembly system under the leadership of the party committee. Moreover, in terms of the course of reforms in the economic management system, these systems are even less appropriate. Consequently, when actively carrying out reforms of the economic management system one cannot avoid simultaneously looking into solutions to problems in the leadership system within enterprises.

III. Striving To Improve the Leadership System Within China's Socialist Enterprises

There are both similarities and differences in the natures of socialist enterprises and capitalist enterprises. The differences primarily involve differences in production relations. This is also true for enterprise leadership systems. There are some similarities in terms of rationally organized production forces and demands that correspond to large-scale socialized production; however, due to differences in systems of ownership, the socialist leadership system inevitably has its own special characteristics.

Based on past experiences combined with the course of future system reforms, the leadership system of socialist enterprises can be summed up in three phrases: develop democracy, unify command, and have comprehensive supervision. As for specific work practices, the staff and workers representative assembly and its standing bodies (such as the management committee) should exercise policymaking authority in enterprises so that all staff and workers in enterprises truly become their own masters and the enterprise becomes an association of free and equal producers. Plant managers (directors) should exercise command authority on the basis of democratic policies. A strong administrative command system that implements policies and handles day-to-day production and management work should be established with plant managers (directors) as the heads. Enterprise party committees should implement comprehensive supervisory authority. They should supervise the staff and workers assembly and its standing bodies as well as plant managers (directors) and cadres at all levels so as to ensure the implementation of state economic policies and laws in enterprises. This will ensure the correct integration of national unity and enterprise independence.

This kind of leadership system may be called the plant manager (director) responsibility system under the leadership of the staff and workers assembly. The staff and workers assembly and plant managers (directors) form a democratic centralist organizational system which takes on enterprise powers and responsibilities. The party committee occupies a position outside of this organizational system, so there is no problem regarding separation of the party, the government, and the enterprise. However, the party organization as the vanguard of the proletariat is responsible for instructing party members by setting an example, for guiding all staff and workers to observe state economic policies and laws, for preserving the socialist nature of enterprises, and for carrying out comprehensive supervision of the conditions of implementation within enterprises.

Will such a leadership system weaken party leadership of enterprises? Tradition and practice have frequently shown that policymaking authority is primary in the power of leadership, and supervisory authority is secondary. This view lacks scientific analysis. Of the three enterprise authorities, policymaking is undoubtedly primary in capitalist enterprises with absolute independence. Thus capitalists must go through their board of directors consisting of their own representatives in order to exercise policymaking authority. However, because enterprise business management increasingly requires specialized knowledge and experience, capitalist enterprises must hire specialists to be on the board of directors. In order to reconcile class contradictions and to implement the so-called "worker participation system" they must hire minority worker representatives to be on the board of directors; thus, the tendency to separate ownership and management has appeared. In order to protect the interests of capitalist owners, capitalists in some enterprises have begun developing the role of supervisory authority. Consequently, the supervisory boards of certain enterprises have even greater power than boards of directors.

Socialist enterprises must also have independence; they should have the right to determine policies independently. However, socialist enterprises under unified state leadership also possess relative independence. Enterprise policies can only be made to a limited extent within the scope of unified state guidelines, policies, and laws and under the guidance of state planning. To ensure unified state leadership, supervision of enterprise operations has become a major problem. The experiences of Yugoslavia and other countries have shown that after implementing reforms in the economic system and expanding enterprise autonomy, this supervision becomes even more essential. Contradictions exist between enterprises and the state, such as contradictions between local interests and overall interests and between immediate interests and long-term interests. Only if the party organization keeps to the standpoint of the proletariat and the interests of all the people, instructs all party members and all workers, and correctly handles these contradictions, can the unity of the state and the independence of enterprises be integrated.

The party organization does not directly participate in the actual policy-making and everyday administrative work in enterprise management; rather, it exercises its comprehensive supervisory authority in enterprises. Thus, it can develop its political leadership role in enterprises in a more objective and more active way. By relying on the prestige of the party and the exemplary behavior of party members, the staff and workers assembly and enterprise leaders will certainly heed and respect the suggestions of the party committee concerning major issues. Even so, if major disputes arise between the staff and workers assembly and the party committee, the enterprise party committee may rectify the situation through a higher level party committee or appropriate leading agency. Therefore, the exercise of supervisory authority by the party committee absolutely cannot weaken party leadership; on the contrary, only by doing this is it possible to truly strengthen political leadership of enterprise work.

If the aforementioned principle can be established and this new enterprise leadership system implemented, it will of course still be necesary to decide on corresponding specific organizational measures. For example, how should the staff and workers assembly be organized and how should its functions and duties be set forth? Should large-scale enterprises under the staff and workers assembly have standing bodies? Is it better to establish general standing bodies or to establish some special committees such as the wage welfare committee and the personnel examination and appointment committee for democratically handling problems of most concern to staff and workers? How should plant managers (directors) be chosen, by election or by having the staff and workers assembly review and appoint them based on recommendations of higher bodies or party committees? How are their terms of office, functions, and duties to be set forth? The relationship between plant manager and assistant plant manager should be one of leader and subordinate. Should the assistant plant manager be nominated for candidate by the plant manager? According to the above system, it is clearly not very appropriate for labor unions to be considered the standing bodies of the staff and workers assembly. Thus, what constructive roles should labor unions exercise in enterprises? When an enterprise forms an association with other enterprises, various kinds of companies or federations are formed. What leadership system should be established in these companies? What leadership system should be established in the branch companies, auxiliary plants, workshops, and other basic level units within the enterprise? Must all administrative offices, workshops and other leading personnel adopt the electoral system? These personnel all come under the command system of policies implemented by plant managers so should they be appointed or nominated as candidates by plant managers? Questions such as these await further study. After undergoing pilot programs, "Enterprise Laws," "Company Laws," and other laws should be issued by the state and the necessary regulations set forth. These should then be put into effect and we should constantly seek perfection. Finally, it is necessary to form a new socialist enterprise leadership system that is uniquely Chinese and create advantageous experiences for implementing socialist economic democracy.

7. Enterprise Consolidation and Strategic Objectives [pp 311-336]

[Text] [Editor's note] This was a report given by the author on 20 December 1982 to the Conference on the Modernization of Technology, the Economy, and Management, held in Beijing. [End of editor's note]

I have been invited to go first in this series of lectures on enterprise consolidation conducted by two institutes. My topic is "Enterprise Consolidation and Strategic Objectives." I believe the sponsoring unit suggested this topic in the hopes that I would discuss the strategic significance of enterprise consolidation. Before tackling this subject more research is required. I have not thoroughly researched this area so I will simply present some of my opinions.

I. Enterprise Consolidation Is a Strategic Measure in the Decade of Preparation

The 12th CPC Congress proposed the magnificent program for China's socialist construction and set forth strategic goals for economic construction. It proposed that we quadruple industrial and agricultural gross output value by the year 2000. The key strategic point is to develop energy resources, communications, etc., while strategic measures are to be divided between the two decades until the year 2000.

Can such a strategic goal be realized? There are differing opinions both abroad and at home. Some believe that it cannot be realized, but the vast majority believes that it can. Some time ago, in his speech at the Science and Technology Awards Meeting, Comrade Zhao Ziyang discussed the strategic problem of economic revitalization, that is, the matter of scientific and technological advancement. Is it possible to achieve these goals based on analyses of current conditions? He said that conditions were both ripe and not yet ripe. You may believe that conditions are ripe but there are still many areas that are not yet ripe. You may believe that conditions are not ripe but once correct guidelines and policies are adopted they then become ripe. This means that there are two possibilities concerning the realization of these goals. If we work hard to achieve the necessary conditions, they can be realized. If we are unable to do that, there is no doubt that by the year 2000 energy resources will at most only double; and according to the current proportion of production and consumption, production will also only double. Therefore, if we do not create the proper conditions, conditions will never be ripe. If present conditions are not ripe, it is necessary to adopt measures to change this situation.

There are numerous and different measures for each period. Comrade Zhao Ziyang proposed five measures in his report on the Sixth 5-Year Plan. In general, what basic problem should we pay special attention to in order to achieve these magnificent goals? Comrade Zhao Ziyang touched upon this problem at the Science and Technology Awards Meeting by asking: What is the solution? The solution consists of improving economic management and adopting advanced technology. He spoke only briefly on improving economic management. He said that economic management is a science, and that it is an extremely weak link at present. The desired results may be quickly obtained by improving management, which will serve to tap tremendous potential. He then explained in detail that the major strategic problem in realizing our strategic goal is to develop science and technology. Since the 3d Plenum of the 11th CPC Central Committee, the party has adopted many policies on developing the economy which have brought order out of chaos. These policies over the past few years have been correct and they have certainly played an important role in changing the economic situation. For instance, agricultural development over the past few years has been advancing by leaps and bounds. This is primarily due to the adoption of new policies, the implementation of the output-related responsibility system, etc. However, further development cannot rely solely on policies. Comrades Zhao Ziyang and Hu Yaobang have proclaimed on numerous occasions that in agriculture we must rely first on policies and second on science.

In his report on the Sixth 5-Year Plan, Comrade Zhao Ziyang discussed measures and mentioned five problems: control of fixed asset investments and accelerating technological transformation, carrying out readjustment and comprehensive enterprise consolidation, enhancing the role of science and technology, system reform, and agriculture. In short, there are two basic problems, one involving policies, management, and organization, and one involving science and technology. Thus, regardless of whether we are talking about industry and agriculture or overall national economic development, we basically have two areas in which we lag behind: one is in science and technology and the other is in organization and management. There are all sorts of concrete measures, but from an overall perspective, there are primarily two strategic measures for realizing strategic goals. One is to raise the standard of organization and management and the other is to raise the level of science and technology. What does the term improvement in the "four point policy" refer to? It chiefly refers to improving economic results. How should we improve economic results? This also depends on improving the level of management and the level of science and technology. This holds true for both industry and agriculture.

As we focus on economic construction and develop our economy, according to political economics, we are developing our productive forces. To develop productive forces it is necessary to have corresponding production relations. If production relations are suitable, this will promote the growth of productive forces. If they are not suitable, this will hinder the growth or productive forces. Production relations include an element of organization. Science and technology form the major foundation for productive forces. Thus, in theory, both science and technology and organization are involved. In terms of the broad sense of the meaning, formulating policy is also a management issue. As for the first line of production, the entire production process is always inseparable from science and technology. Without prescribed levels for science and technology, production will inevitably be limited. According to the Marxist viewpoint, science and technology are first manifested in technological equipment, namely, the tools of production.

At the same time, it is also manifested in the scientific principles and technological processes reflected in technological equipment. It is also linked to the knowledge and skills of those who handle technological equipment. All this is called science and technology and includes both software and hardware. The production process is inseparable from science and technology. The most primitive and simple production, regardless of whether one realizes it or not, still involves science and technology. When peasants till the land and cultivate grain crops, the law of biological development is at work. After mastering the objective laws of cultivation techniques, they use our subjective methods to promote and hasten the growth of crops.

Production cannot be separated from science and technology, nor can it be separated from society. Since the beginning of society, production, unlike Lu Binxun [7627 3453 6676], has never totally relied on the individual. Even in a primitive society man carries out mutual cooperation as a small group or as a small collective in the clan society. Therefore, the characteristics of man are that he is an animal capable of manufacturing tools and that he is a social animal. From the beginning, production has had a socialized nature. When a group of people practice cooperation the issue of organization inevitably arises. For those with similar scientific and technological levels, results differ greatly depending on the quality of organization. Technical facilities in some of our plants are quite backwards while others are more advanced. Isn't productivity in those with advanced facilities necessarily higher than in those with obsolete facilities? Not necessarily; it depends on organization. Certainly during the 10 years of turmoil and even at present there are quite a few plants that have a large number of advanced facilities as well as large numbers of technical personnel. However, productivity is low and there are no tasks, which leads to enforced idleness. Potential has not been tapped, and what is more, surface "buoyancy" has not been developed. Shortcomings in our system have led to the whole people being inferior to the collective, the large collective being inferior to the small collective, and the small collective being inferior to the individual. These are all abnormal phenomena. If collectives cooperate successfully, their power will certainly surpass that of the individual; otherwise, how could society advance?

These sorts of abnormal phenomena have appeared due to irrational organization. If organization is poor then even advanced technology is of no use or if it is put to use, its efficiency is not fully developed. For instance, a certain number of computers were manufactured in China and introduced throughout the land. We should take a good look at how many are actually fully utilized and fully exercise their function. Why is this? We cannot blame the computers themselves nor can we blame technology, for the technology is advanced. The principal problem is poor organization. If organization is poor then no matter how advanced the technology, it cannot fully exercise its function. This is true for people, too. We are extremely lacking in qualified personnel. There are few college graduates nationwide. Can this small number of very valuable qualified personnel all be fully utilized? Some are students who have returned from studying abroad. These returned students may be placed in a position for several decades and never used until their knowledge is obsolete. What kind of craziness is this? Examples are too numerous to mention individually. This shows that science and technology are interlinked with organization and management. They must be integrated, as they are equally vital. In a certain sense, organization and management are even more important than science and technology in that they become effective quickly. The utilization of science and technology does not necessarily require investment. Some new methods do not require any investment and once they are put to use the desired results can be seen immediately. However, most science and technology must be reflected in certain material equipment, and a certain amount of production materials is required to reflect technology. Thus, some investment is necessary. Organization and management do not require investment at all. Of course, the tools of modern management such as computers require some investment. However, most management problems have to do with the quality of organization, which does not require any technical equipment. Therefore, by stressing organization and management we may receive much interest with no principal or much interest with only a little principal.

Today we are lagging behind in the two areas of science and technology and organization and management, but we are most behind in management. Even though at present we lag behind in science and technology, we have made some advances. We do not have much advanced technical equipment, but we do have some. Its potential, however, has not been fully developed or it has basically not been utilized. Consequently, if work in management and organization is improved, it is only natural that first "buoyancy" and then potential will be developed. Due to poor organization it has not exercised its proper function. Therefore, in a certain sense, the strategic measure of organization and management is even more important.

Enterprise consolidation includes the consolidation of industrial enterprises, commercial enterprises, communication and transportation businesses, and the consolidation of the other cells and basic level economic entities of the national economy. What exactly is being consolidated? Management, primarily. Of the past two decades, the first was spent laying a solid foundation, accumulating strength and creating conditions so as to facilitate entry into a new period of economic growth during the second decade. An important part of these preparations, this foundation, and this accumulation of strength, are the "two increases": to increase the level of technology through technological transformation, and to increase the level of microeconomic management through enterprise consolidation and to increase the level of organization and management in the overall national economy through system reform and readjustment. Thus, enterprise consolidation is of major strategic importance during the decade of preparation.

II. Enterprise Consolidation Is a Major Link in Implementing the "Four Point Policy"

Here we are actually taking the first issue and analyzing it a bit further. Above, I said that enterprise consolidation is a strategic measure during the decade of preparation. Enterprise consolidation cannot continue until the year 2000; rather it is an important measure for the first decade. Work in organization is to be carried out over the long term, but consolidation is essentially a particular phase. Once it is completed and the level of management in the overall national economy and in enterprises has improved, it will continue to develop. However, this does not come under the scope of consolidation, so it is a strategic measure of the first decade. Reports of certain comrades in the central leadership have dealt with the "four point policy" or the 10-point construction policy that came later. The reports were all in reference to the first decade. If the Sixth 5-Year Plan were to continue to implement the "four point policy," would it be terminated during the Seventh 5-Year Plan? No. Take reform for example: implementation of comprehensive reform can only be begun during the Seventh 5-Year Plan. Therefore, I believe that the first decade is basically the time for the actual implementation and practice of the "four point policy" or the 10-point construction policy. The "four point policy" refers to readjustment, restructuring, consolidation, and improving, and consolidation is the link. Thus, consolidation is a significant strategic measure for the decade of preparation.

What is the relationship between consolidation and the other three? First of all it is necessary to show what problems the "four point policy" is addressing. Readjustment chiefly refers to changing the irrational economic structure created by "leftist" errors of the past such as disproportionate relations between accumulation and consumption and between heavy and light industries, an overextended basic construction front, inflation, financial deficits, and other serious crises. Without readjustment it is impossible to change the overall national economic situation. This is the problem to be solved by readjustment. Restructuring refers to restructuring irrational economic structures of the past. As for the system of ownership, in the past we engaged in ultra-leftism and extremism. We cut off the "tail of capitalism," tried to achieve communism overnight and thereby created a simplified ownership system. Management adopted highly centralized methods. Areas had little autonomy and enterprises had even less, such that the entire economy was stifled. All this must be reformed; it is the only solution. If readjustment and restructuring emphasize the macroeconomy, then consolidation must focus on the microeconomy. Improving refers to improving economic results by raising the level of technology and management. Improvement is the end result.

In order to aim at this result it is necessary to do some work. As we break down and analyze the "four point policy," it basically boils down to a problem of organization and management. Readjustment will resolve the management problem in the overall national economy; restructuring will also include economic management in all departments; and consolidation is directed towards organizational and management problems in enterprises, that is, the cell and basic-level entity. Thus the four items in the "four point policy" actually consist of major overall readjustment and consolidation in management. Enterprise consolidation began after the overthrow of the "gang of four." Early in 1982, the CPC Central Committee and the State Council proposed that the first comprehensive consolidation of all state-run industrial enterprises take place within 2 to 3 years. There were many comrades who did not really understand this.

The consolidation currently proposed by the Central Committee is naturally the continuation of the consolidation following the overthrow of the "gang of four." However, the current consolidation differs from the former consolidation. It is a part of the strategic measure of the "four point policy" and it is necessary to take into account which opportune moment is used to boldly centralize power to implement consolidation. Consequently, consolidation is an integral part of the "four point policy." In order to comprehend its strategic significance it is necessary to begin by understanding the "four point policy." In the broad sense it is intending to resolve problems in organization and management. Readjustment and restructuring refer to how to organize the overall national economy, such as balancing consumption and accumulation, and the proportionate relations between agriculture, light industry, and heavy industry. Why do problems appear in these structures? Certain erroneous policies were implemented in the past. Policies are part of organization, the principles of organization. In the past we adopted inappropriate organizational measures based upon mistaken principles such as seeking high targets in planning. As a result readjustment must resolve problems in macroeconomic control and restructuring must resolve problems in organization and management from a macroscopic viewpoint. This affects the microeconomy. Take for instance the relationship between the state, the enterprise and workers. The state must control the enterprise but the methods and procedures adopted vary greatly. At the same time, this involves internal management within the enterprise. This is a matter of consolidation. In addition to improvements in management and organization, technological advancement is also necessary. Technological development itself involves the issue of management. For example, where is the capital for technological transformation to come from? Should funds be raised independently or should the state allocate funds? If the state allocates funds, should it allocate funds across the board or on what basis? For instance there was the Shougang transformation project for which it was necessary to apply for approval every year so that it dragged on for many years and was never completed. Once autonomy was established the project was completed in a few months. Thus technological transformation may also encounter problems in the management system. At present economic results are poor, and it is necessary to improve them. In some enterprises output value and yield are high yet the goods do not satisfy the demand. They are stocked in warehouses so that utilization value cannot be realized. Why is this? This too is a management problem.

The four items in the "four point policy" are inseparable from management. What position does the enterprise consolidation that we have been discussing today occupy in the "four point policy?" Much deliberation went into formulating the "four point policy." Since readjustment is the most urgent, it must be resolved first and thus has priority. Restructuring is the basic solution for China's economy, followed by consolidation. What then is the position of consolidation in the "four point policy?" What is its function?

Why did the Central Committee only propose comprehensive consolidation in 1982? They all have some internal relationship. At present we are discussing consolidation, in particular, enterprise consolidation. In order to comprehend this question it is necessary to understand the position and role of enterprises in the overall economy.

Prior to the 3d Plenum of the 11th CPC Central Committee, enterprises were treated entirely as branches of the government. In party organizations, from the central government to the localities, enterprises were basic-level party organizations, and each level controlled another. The enterprise party branch or party committee came under the control of the local party committee, and administration was organized along similar lines. However, enterprises are economic organizations, they engage in economic activities. In the former system enterprises were set up as government branch offices. They had no relative independence and thus resembled the beads of an abacus which are moved one at a time. In this way enterprise work was easily handled. One did whatever higher authorities ordered. All enterprises followed one slogan: "Thoroughly fulfill state plans." The state issued tasks and the enterprise fulfilled them. Once all tasks were completed everything was fine and dandy. The state even took care of things if goods were not marketable or did not satisfy demand. In such a situation the enterprise basically concerned itself with production management, not business. Today things are different. Following the Third Plenum, reforms were initiated to change this highly centralized management system and to expand enterprise autonomy. Enterprises should be relatively independent economic entities. No one can deny that commodity production and exchange still exist in our socialist society. Under socialism we do have a planned economy but we cannot deny that enterprises do engage in commodity production. Thus, as for the function of enterprises, it should be acknowledged that enterprises are relatively independent commodity producers. Without doubt, relative is the key word. It is not absolute independence and it differs essentially from the situation under capitalism. Enterprises may take the initiative and be active in business. As Comrade Chen Yun recently said, you cannot hold a bird in your hand, for it will be crushed. You should let it live, and to do so you must put it in a birdcage. Of course, the size of the birdcage is a problem. If the birdcage is as big as the bird it will die.

The socialist planned economy can be compared to the birdcage. Enterprises within the birdcage should have relatively independent autonomy in business operations. The enterprise is the fundamental cell of the national economy. Where are the production forces we talk about? Are they not within the enterprises? The government must manage enterprises, but the forces of production are not found in the government. You may manage an enterprise but the production forces operate on the first line of enterprises. Therefore, enterprises, as relatively independent commodity producers, must provide vitality and have relative autonomy; only then can they function. This requires restructuring our management system. Following the Third Plenum, trial reforms in the economic system got underway. These reforms created beneficial external conditions in enterprises by stimulating the microeconomy.

If we regard the enterprise as a "hero," then the reforms provide the "hero" with "scope for displaying his abilities." Reforms have created conditions for the even more vital development of productive forces in enterprises. However, are external conditions as good as they should be? Objective conditions are satisfactory but subjective conditions are not; they are inappropriate. In the past few years there have been reforms and readjustments which have brought about changes in the objective conditions of enterprises. Once we decreased the basic construction front, there was a relative decrease in the demand for the means of production and right away the tasks of mechanized industry decreased. According to past procedures, how should this be dealt with? The state had to issue wages to support it. We are currently carrying out readjustments and reforms to give enterprises some autonomy and have linked the quality of business with the interests of enterprise workers. Enterprises may now take the initiative to engage in business. They do not engage in production behind closed doors but rather "seek rice beneath the pot." If there are no tasks, they go out and seek assignments themselves.

Thus, if there had been no reform, it would have been difficult to successfully carry out the readjustments of the past 2 years to the extent that they have been implemented. The state would have had to spend large sums of money to support them. In this way there are both readjustments and reforms. Reforms have resolved difficulties in making readjustments and have expanded enterprise initiative. Once external conditions have been restructured it is still necessary to ensure that internal conditions within enterprises correspond. If business operations are not emphasized within enterprises, and basically no consideration or effort is applied to this area, then even though reforms may provide the necessary conditions, that is, even though the birdcage may be quite big, the bird will still be unable to fly away. Its wings will be powerless and it will be unable to fly. Thus, we cannot have readjustment without reforms. Readjustment and reform require enterprise consolidation, which involves increasing the potential for internal conditions to respond to changes in external conditions. In 1979 industrial reforms began to expand enterprise autonomy. In 1981 the focus switched to implementing economic responsibility systems. On the basis of expanding autonomy a management system developed which combined responsibilities, rights, and interests. It is first necessary to allow enterprises to have autonomy and their own relative economic interests; only then can we talk about responsibilities, rights, and interests. How are responsibilities, rights, and interests to be realized? There must be a scientific management system and methods within enterprises. Only then can the requirements of system reform be met. As in the Capital Iron and Steel Works, there must be contracts and guarantees at each level within enterprises. Thus the central links in the "four point policy" are readjustment and restructuring. At a certain point--early in 1982 [as published]--we must begin advocating comprehensive enterprise consolidation. The significance of enterprise consolidation may be understood as the major link in the "four point policy."

III. Comprehensive Enterprise Consolidation Is Constructive Consolidation

In a literal sense what we are calling consolidation generally means making an abnormal situation return to normal. Once the "gang of four" was overthrown, it was proposed that we carry out enterprise consolidation. Each department suggested specific consolidation standards and carried out various experiments. Now consolidation has been proposed once again but a word has been added before it, that is, "comprehensive consolidation." This differs from the earlier wording. The consolidation that followed the smashing of the "gang of four" was a result of the 10 years of turmoil. Normal management was destroyed and leading groups were undermined by the "gang of four." The ranks of staff and workers, regardless of ideology, profession or education were all influenced and damaged by the 10 years of turmoil. All enterprise management rules and regulations were also destroyed. Therefore over the past few years consolidation has primarily been restorative. However, present consolidation is constructive. Just now a comrade asked: Will this consolidation rehabilitate those who break rules and regulations? For those who break rules and regulations there must of course be rectification. Of the five tasks to be worked on at present, there is the task of strengthening financial and economic discipline. For violations of financial and economic discipline it is necessary to carry out rectification. Some comrades have asked: Should the current consolidation include readjusting the irrational organizational structures within enterprises? Should small enterprises be consolidated? This touches upon our understanding of the meaning of enterprise consolidation. According to the spirit of the Central Committee, the current consolidation differs from the earlier restoration consolidation in that it is constructive in nature.

What work is involved in constructive consolidation? The Central Committee directive put it very clearly. At present it is above all necessary to focus on five tasks. First, we must consolidate and perfect the economic responsibility system, to improve enterprise business management, and to successfully carry out work in comprehensive planning management, quality control, and economic accounting. Second, it is necessary to consolidate and strengthen labor discipline and strictly implement a system of awards and penalities. Third, it is necessary to strengthen financial and economic discipline and strengthen the financial management system. Fourth, it is necessary to consolidate labor organization, organize production according to quotas and fixed numbers of staff, train all personnel in a planned way, and resolutely overcome the phenomena of being overstaffed and doing careless and sloppy work. Fifth, it is necessary to consolidate and establish leading groups and strengthen ideological and political work directed towards staff and workers. At the present time consolidation is being carried out throughout the land. Everyone is focusing on these five tasks. Liaoning and other provinces have been quite successful and have already begun to carry out experiments. In Beijing Municipality, the majority of experiments will be carried out next spring. These so-called experiments still refer to the five tasks. It is possible that there may be a misunderstanding that enterprise consolidation consists of these five tasks and that if they are carried out consolidation will be completed. This is wrong. These five tasks are only the minimum tasks to be done in enterprise consolidation. True constructive consolidation consists of the "three establishments" and, by means of the "three establishments," we arrive at the "six demands for improvements." The three establishments are: 1) To gradually begin to establish a democratic and centralized leadership system. The consolidation of leading groups is a problem that currently needs to be resolved. Once leading groups have been readjusted, however, we cannot say that we have now established a leadership system that is both democratic and centralized. Once leading groups have been readjusted the next step is to establish a democratic and centralized leadership system. 2) To gradually establish ranks of staff and workers who are both red and expert. Of the five tasks, it is necessary to strengthen labor discipline and labor organization, and, on this basis, to upgrade the political, educational, professional, and technical levels of all staff and workers. 3) To gradually establish a scientific and civilized management system.

Once the three establishments are completed we must meet the "six demands for improvements." The "six demands for improvements" refer to enterprises being able to correctly handle the economic relationships between the state, enterprises, and individual workers and doing an outstanding job of fulfilling state plans so that enterprises reach the point where the three give consideration to each other, have high quality products, fine economic results, strong labor discipline, highly civilized production, and good political work. Enterprises with the "six fine points" are evaluated on the basis of the "six demands for improvements." Current experiments only include experiments of the five tasks which are not equivalent to tests of overall consolidation. Enterprises which have attained the "six fine points" are the result of carrying out the "three establishments" in a planned way. It is necessary to undergo comprehensive consolidation to choose enterprises with the "six fine points," so this time period must be extended somewhat. Advanced enterprises may be at the forefront. All state-run industrial enterprises should have achieved comprehensive consolidation before 1985. There are more than 380,000 state-run industrial enterprises throughout the country, and emphasis should be given to large-scale enterprises. Medium- and small-sized enterprises should, of their own accord, formulate consolidation plans according to their own conditions and characteristics. Their requirements, however, may differ. For instance, the requirements of the Capital Iron and Steel Works certainly differ from the requirements of small enterprises with 100 or 200 people.

Why must we now focus on comprehensive enterprise consolidation? In the second question we just discussed the relationship of consolidation and the other items of the "four point policy." Consolidation is connected to system reform. Reform creates important external conditions for enterprises but, at present, reform is still in the experimental phase. Experiments are first carried out in a few enterprises. Comprehensive experiments are now beginning in medium-sized cities such as Changzhou and Shashi. Soon comprehensive experiments will be carried out in large cities (Chongqing will be first). It is important to carry out various reform experiments and, at the same time, formulate overall plans. As for carrying out comprehensive

comprehensive reforms, it may be necessary to look to the Seventh 5-Year Plan period, that is, carry out reforms only after 1985. Although current reforms are still in the experimental phase it is necessary to accelerate the pace in a positive and safe manner. To coordinate reforms it is necessary to use the spirit of reform to carry out overall consolidation of cells, namely, enterprises. After 1985, as comprehensive reforms get underway, enterprises can then adapt to them.

At present the Central Committee and provincial municipalities should first stress the consolidation of some large- and medium-sized enterprises. Small enterprises should implement the "three establishments" based upon their own circumstances and characteristics and strive to attain the "six demands for improvements." Since system reform is now being experimented with, changes may occur in some conditions. For example, at present there is a tentative plan: particularly small enterprises, especially service industries, etc., may adopt management by staff and workers and fully implement the policy of assuming sole responsibility for profits and losses. The internal system of such an enterprise may differ entirely in terms of work methods from an enterprise directly managed by the state. Nevertheless, whatever the method, the "three establishments" must be implemented. As for the special characteristics of socialism, the principle of socialist democratic centralism should be applied in all enterprises regardless of whether they are large state-run enterprises or small state-run enterprises or even enterprises with a system of collective ownership. Recently the Ministry of Organization in the Central Committee of the CPC and the National Federation of Trade Unions held a meeting to sum up experiences of the leadership system. The Central Committee summarized the system in three phases: first there is party committee collective leadership; second, democratic management of staff and workers; and, third, plant manager (director) administrative command. All enterprises must reflect these three principles. Based on these three principles what kind of internal management system should there be? This question still awaits our answer. Currently, relatively successful democratic management by staff and workers has adopted the forum of the Staff and Workers Assembly. However, some enterprises in the Staff and Workers Assembly are formalistic and do not really regard the masses as the masters or motivate their initiative; other enterprises have done this quite successfully. Specific methods vary as do results. Regardless of the type of enterprise, as long as they are socialist enterprises, it is possible to establish a leadership system based upon the principle of democratic centralism. This is the first part of the three establishments.

The second part is to establish ranks of staff and workers who are both red and expert. This has both major economic and political significance. Where do we find this working class? The majority are in the enterprises. Major concentrations of the working class are found in large enterprises in particular. Therefore, how enterprises train workers to be both red and expert not only has major significance for improving economic results and the levels of technology and management in enterprises, it also has important political significance for enhancing the quality of the entire working class. All enterprises should integrate fixed numbers of staff with quotas so as to organize production, release surplus personnel to carry out training in rotation, conduct political, vocational and educational training in rotation, and upgrade standards. Whether enterprises perform this poorly or well, each has its strong points and each can display its abilities. Here we should not distinguish between large and small enterprises; small enterprises have fewer people but they should still maintain this objective of struggle.

The last part is to establish a scientific and civilized management system. The items contained in this part are even more numerous.

In his report on the Sixth 5-Year Plan, Comrade Zhao Ziyang mentioned readjustment and consolidation. There was some change in the Central Committee's wording concerning consolidation in early 1982. He said that the key to comprehensive enterprise consolidation is threefold. First, establish a solid leading group. This was also mentioned as part of the five tasks. Second, establish and strengthen all regulations and rules as well as the responsibility system. In the three establishments this is the problem to be solved by establishing a scientific and civilized management system. Third, formulate a program for technological transformation with conserving energy resources and materials as the key point, and determine a direction for rational product development. This means we must include technological transformation and technological advancement within the sphere of enterprise consolidation. This is something that has not been mentiond before. Technology and organization are two strategic measures. What is the significance of bringing them together at the present time: Technological transformation and technological advancement inevitably involve the issue of organization and management. In enterprise consolidation, while establishing a scientific and civilized management system, it is particularly necessary to pay attention to the problems of technological advancement and management. Scientific research, design, and technological transformation are purely technological matters. Formulating technological transformation plans, carrying out surveys and market forecasts, determining the direction of rational product development and then proceeding from design, technology, and trial manufacture to formal production and rational organization, however, are all management issues.

In his report on the Sixth 5-Year Plan, Comrade Zhao Ziyang also mentioned the four signs of successful enterprise consolidation: The output-related responsibility system, a shift in labor discipline and labor attitudes, products which meet demand, and major economic and technological indicators and economic results that exceed those before consolidation. This primarily refers to the consolidation of enterprises by means of the five tasks and the several signs that experiments are being implemented, not to all the requirements of comprehensive consolidation. What are the final objectives of constructive consolidation? They should be to lay a foundation for establishing modern socialized enterprises that have an advanced material and spiritual civilization and are uniquely Chinese.

Further explanation of the three establishments is necessary. What does the term scientific and civilized management system refer to? Scientific and civilized management implies modernized management. Can modernized management be attained after 2 or 3 years of consolidation? I believe that this is not very likely; modernized management cannot be attained by all enterprises within such a short period of time. Establishing a modernized and new situation before the year 2000 does not mean that it has to be done in the next decade or before 1985. The establishment of a scientific and civilized management system refers to making improvements on the basis of reality. Nevertheless, although modernized management cannot be fully realized within 3 or 5 years, as long as conditions for its realization exist, we should still forge ahead in the direction of modernization. In his report Comrade Zhao Ziyang mentioned numerous times that it is necessary to establish and strengthen management rules and regulations. In terms of the next 2 to 3 years, what should be included? Based on the experience of several advanced enterprises over the past few years we may sum this up as "one system and four comprehensives."

"One system" refers to the basic system--a democratic centralist leadership system. This includes a very important point, that is, democratic management by staff and workers. This is also a key characteristic of socialist enterprises. What we are engaged in is Chinese-style modernization. Capitalist enterprises at times also emphasize democratic management, such as West Germany which has adopted the worker participation system and a board of directors which makes use of worker participation, etc. Under such a system of private ownership, however, workers cannot truly be their own masters; there can only be steps to alleviate the labor-management contradiction. When it involves the basic interests of capitalists, the right to decision still resides with the chairman of the board who represents the interests of capitalists. The modernization of socialist enterprises must, above all, incorporate the special features of socialism. This system does embody socialism and this is most basic. This is the "one system."

Work in enterprise management is made up of the four areas of comprehensive management, namely, the "four comprehensives": comprehensive planning management, comprehensive quality control, comprehensive economic accounting, and a comprehensive labor management system.

"Comprehensive management" was introduced from abroad. This so-called comprehensive management is a form of overall management or system management. In the past enterprise management stressed specialized management such as commodity management, labor management, etc. It lacked a system for organizing the chief objectives of enterprises. Actually, much of our work is done in this manner but the guiding ideology of management is not that clear; no systematic ideology is used to handle the various tasks of management work. In the phase of restorative consolidation, after the "gang of four" was overthrown, comprehensive quality control was introduced (at that time problems in quality were quite serious). Comprehensive quality control holds that product quality does not depend on inspection departments in isolation. The entire process and all staff should be part of quality control.

In this way quality control becomes systematic control. Once this idea was introduced several enterprises in Shanghai developed this idea while studying and popularizing it. A Shanghai diesel engine plant successfully carried out economic accounting; they believed that the spirit of comprehensive quality control could be applied in addition to economic accounting. All departments throughout the plant participated in economic accounting and were equally involved in the entire process. From design and technology to marketing, all sectors focused on economic accounting and all staff participated. Thus emerged the new concept "comprehensive economic accounting." Later, after further development, the State Economic Commission added another "comprehensive," namely, comprehensive personnel training. Comprehensive personnel training should be a part of comprehensive personnel labor management. If training is not linked to management of other personnel affairs, then we cannot say it has been effective; we can at least say it has not beey very effective. For example, at present, some enterprises and numerous departments have organized many training classes to train qualified personnel. The training has played a major role these past few years in upgrading the level of management and the educational and technical levels of workers. Nevertheless, certain conditions have arisen. Based upon what I know, prior to the previous wage evaluation they were very active because they heard that during wage evaluation their work would be checked. Later on wage evaluation became irrelevant and their enthusiasm suddenly disappeared. Why? They lack enthusiasm because it is a case of "it is required that I learn" rather than "I want to learn." A change in the position of the same few words results in a totally different situation. If comprehensive personnel labor management were implemented, and training, assignment, utilization, promotion, and transfer were all taken into account, conditions would change fundamentally. For instance, it is stipulated that several grades of work are required for entry into every position. Certain knowledge and skills are specified and it is required that the person entering the position must have attained a specific educational level and a technical training certificate. Only after undergoing training and passing an examination can he enter that position. Suppose that you are a grade three worker and you undergo training, pass an examination, and reach the grade four level. You will then be assigned to a grade four position and will enjoy its benefits. Later on you may have the opportunity to be chosen to undergo further training and attain the grade five level. You will be sent to a grade five level position and will enjoy its benefits. If such a comprehensive personnel labor management system is formed, every worker will have the attitude towards training of "I want to learn" rather than "it is required that I learn." Through study it is possible to improve oneself, which is of benefit to the collective, to work, and to the individual. This is the means for developing men of talent. It is called "comprehensive management" because throughout the plant, regardless of the department or individual concerned, training and rational utilization are needed. This involves the overall process and all personnel. Merely implementing training for all personnel will not resolve the problem (of course, it still plays a large role); there should be a comprehensive personnel management system which includes personnel training.

Comprehensive planning management. Planning in capitalist enterprises is very careful yet there is no planning in overall social production. In socialist countries, not only should planning in enterprises be very strict but there is also planning in the overall national economy which is linked to enterprise planning. Our production must satisfy the needs of society and it is embodied, above all, in the implementation of state plans. There must be improvements in state planning. It should satisfactorily reflect all the most important needs of society that are related to the national policy for the people's livelihood. This is the part that makes up ordered plans. Some enterprise products go towards fulfilling state orders, other products meet the demands of society through market regulation. In this way, enterprises must make their own market surveys and forecasts. The purpose here is also to satisfy the demands of society. An enterprise must combine state plans and its own product plans for "seeking grains under the pot" or promoting sales to form an enterprise production goal, an overall goal. In order to realize this overall goal it is necessary to break it down bit by bit among various departments and basic levels. This constitutes comprehensive planning management in enterprises. Thus, we believe that it is necessary to establish comprehensive planning management with the goal of fulfilling state plans and satisfying the needs of society (this is similar to target management abroad). Production business planning, from production to marketing, is the principal line but it is still necessary to organize, by means of planning, this line and the supplementary production and service work involved. All sections and departments in enterprises should have plans; moreover, they should be implemented at each level and in every position by every individual so that the activities of all people in the enterprise are planned and have objectives. Also, these plans must be consistent with the planning objectives of the entire enterprise. This is the most complete and comprehensive form of enterprise management, that is, comprehensive planning management.

Comprehensive quality control is basically use value control. Comprehensive quality control is currently being promoted in all enterprises and they are all fairly familiar with it. However, one misunderstanding persists: often comprehensive quality control is seen as quality control in the production process. This is not enough. True comprehensive quality control should proceed from meeting demands and the feedback of market information. Not only does this include work quality but also product quality and the suitability of product variety specifications to market demand. This broad concept should be part of the meaning of the term. Some comrades advocate that "comprehensive quality control" be changed to "comprehensive quality and technical control." Actually this will resolve problems in product and technical development; it involves control of the entire plant as a system from the perspective of use value. Comprehensive economic accounting, on the other hand, involves control from the angle of value and live and materialized labor consumption.

Marxist economic theory holds that commodities have a dual nature: they have use value and they have value. Comprehensive quality control (also known as comprehensive quality and technical control) and comprehensive economic accounting, based on the two aspects of commodities, form exactly two systems which exert control. Here we are referring to physical objects, particularly the objects of labor. The creation of all objects depends on people; thus, the management of people is involved. There must be comprehensive personnel labor management which has motivating worker initiative and exploiting men of ability as its goal. The first two kinds of comprehensive management proceed from the dual nature of commodities and the last one has to do with people. On top of this there is even more complete comprehensive planning management. If we combine these kinds of management, they constitute one system. In addition, we must also have a democratic centralist leadership system. This "one system and four comprehensives" management system emerged from the masses. In it we can see the embryonic form of a Chinese-style socialist enterprise management system. It corresponds to the economic laws of socialism and to the fundamental principles of Marxism.

After analyzing the Central Committee directive in early 1982 we believed that it involved the establishment of an enterprise management system (or organizational system) which corresponded to the special characteristics of China. This is the last item of the three establishments in enterprise reorganization--the establishment of a scientific and civilized management system.

How do we gradually bring about modernized management? First of all there should be a Chinese-style socialist management system as the foundation. We must earnestly sum up experiences learned from abroad in the 30 years since the founding of the nation as well as our own experiences. We must put the "one system and four comprehensives" into concrete terms. All this should be the final work to be done in enterprise consolidation. Conditions permitting, nothing must be excluded; both the "one system" and the "four comprehensives" can assimilate and apply modern foreign enterprise management techniques. For instance, comprehensive planning management can apply foreign target management experiences which include numerous fine methods. The situation regarding comprehensive quality control is even more clear-cut as we have already absorbed and applied the numerous quality control techniques of Japan and the United States. Comprehensive economic accounting is economic accounting of the entire process. It is necessary to have economic concepts for products beginning with design and technology and then implement budgeting, make economic appraisals, and absorb methods of value engineering from abroad. Comprehensive personnel labor management is similar in that much of foreign behavioral science is colored by capitalism. Nevertheless, there are also many fine techniques that we can borrow. There are also numerous methods we can make use of in establishing a leadership system that is both democratic and centralized. For instance, there is the matter of how to set up management offices. Thus, we can learn from the fine experiences of other countries and apply them to the "one system" and the "four comprehensives." There is one important point however; when absorbing foreign experiences it is necessary to have our own experiences as the basis. We must not copy others indiscriminately, for this would make it impossible for new methods to really take root. We should consider our own experiences as the foundation and then go on to assimilate the fine methods of foreign countries so as to enrich our own experiences. This is certainly not a return to the situation of blind opposition to all things foreign that occurred during the period of the "gang of four." Blind opposition to everything foreign is not right; neither is thinking that "the moon over foreign countries is fuller than the moon over China." That too is going to extremes. Once we have our own system and have summed up our own experiences, then we can selectively adopt all modern foreign management exeriences that are beneficial, useful, and good for us. While doing so, we can also make changes based upon our own circumstances. If there are some areas in which we are advanced and doing well, then there is no need to copy foreign experiences. In the preceding period, RENMIN RIBAO published my article, "Striving To Establish a Socialist Science of Management Which Is Uniquely Chinese," in which this issue was discussed. It is said that some comrades took exception to some wording in this article. For example, I wrote: In quality control "we already have numerous 'reliability team' activities that are distinctively socialist, so it is not necessary to simply imitate foreign 'quality control teams.'" Some comrades felt that I put this badly. People are just now implementing quality control teams and I am throwing cold water on them. To date, I have not yet figured out why we should set up such teams (perhaps I am being rather obstinate). This does not mean that we cannot study those methods. Why not absorb the methods of others while having our own reliability teams as the basis? Japan has had many fine experiences, one of which is significant and worth studying. They are very good at assimilating the experiences of foreign countries. Japan assimilates techniques as long as they are successful from all over the world, not only modern ones, but even ancient ones. Some time ago a professor from Japan came here to give lectures. He made a point of talking about absorbing ancient Chinese thought in Japanese management, particularly the military strategies of Sunzi. They have learned about comprehensive quality control from the United States without copying it indiscriminately, and have developed quality control that is distinctively Japanese. Their management by the masses was inspired by our experiences in the "two participations and one reform," and quality control teams came into being in this way. We should also emulate all the fine things of foreign countries. No matter whether they are from Japan, the Soviet Union, or the United States, we should absorb them all as long as they are useful for us. We must not, however, imitate indiscriminately. We have our own fine things that we must develop. It is necessary to put our experiences first and augment this with the fine methods of others, that is, add flowers to the brocade. Take for example the reliability teams instituted by the Loyang Bearing Plant. Their four areas of reliability are: In manufacturing a product it is first necessary for the firm to be reliable and then for inspectors and consumers to be reliable, and finally to be responsible to the state so that the state is reliable. Only the working classes in socialist countries have this kind of spirit and drive. Why do we not give it full play? We can assimilate the experiences of Japan's quality control teams so as to enrich our reliability teams. In this way they will have our own distinctive characteristics and it will be even easier to inspire the broad masses of workers. Under the principle of upholding the socialist way, we must be broad-minded and incorporate all the fine things from other countries and make them our own. Thus, as we look at modernization we first of all encounter the problem of making foreign things Chinese.

The 12th CPC Congress, and particularly Comrade Deng Xiaoping's inaugural remarks, provided a highly generalized look at how to correctly approach the experiences of foreign countries which, I believe, may be equally applied to modernized management.

Due to limitations of time I am unable to offer further elaboration of what I have discussed today. It is very possible that certain comrades will think that I am being complacent and conservative, indulging in parochial arrogance and engaging in narrow-minded nationalism. Actually this is not my intent. Take for example the popularization of foreign experiences in comprehensive quality control. Since the beginning I have participated in popularization. I have been very much in favor of this and certainly have not opposed it. However, I feel that it is necessary to undergo comprehensive enterprise reorganization to accomplish those goals mentioned above, one of which is to establish an enterprise management system that incorporates Chinese-style socialism. Let us all join forces and work together.

Please feel free to point out any errors I have made in this talk.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

Beijing JINGJI LILUN YU JINGJI GUANLI [ECONOMIC THEORY AND BUSINESS MANAGEMENT] in Chinese No 6, 28 Nov 85 pp 45-49

[Article by Liu Zaixing [0491 0375 5281], Statistics Institute, Chinese People's University, "Various Problems in Integrated Economic Zoning"]

[Text] 1. Should Primary Economic Zoning Be Done

I believe that not only should primary economic zoning be done, but that it should be begun as quickly as possible. This is because intermediate and long-range planning requires an accurate arrangement of proportional relationships for development between areas, a rational distribution of productivity, and the strengthening of macroeconomic control, all of which require delineation of economic zones from the outset. Though administrative zoning can take over the task of organizing regional economic activities to a certain extent, nevertheless administrative zoning arises out of political considerations, area units being drawn up for the sake of administrative management and control. The purview of these areas frequently differs from economic zones delineated primarily on the basis of economic factors and may readily lead to use of administrative methods to manage the economy for a rigid system of regional management that violates economic laws and that artificially cuts economic and technical links among areas. The laying out of productivity patterns in terms of three major economic areas is a major step forward from the use of administrative regions; nevertheless, the three major economic zones are a rather crude delineation that can only reflect the overall trend and the general outlines of the macroeconomic pattern of the entire country at a certain stage. Since China is a vast land in which the differences in the north, south, east, west,and center of the country are very great, division of the country into only three economic zones would make difficult the resolution of an equitable division of labor between one region and another and overall development of the economy within economic regions, which is to say it would be difficult to put in place an overall trend in the patterns of productivity. During recent years a regional pilot project for land planning has been implemented in which various kinds of "economic zones" have been defined. Because specific tasks in zoning have varied, the purview and the emphasis of work have differed, and the types have been different, it has not been possible to dovetail one region with another or to harmonize the contents of one plan with another to form a multi-level interrelated economic zone system. Consequently, it has also been difficult to solve the problem of regional division of labor, and the basic regional units for laying out patterns of productivity have also not been suitable. The essence and major tasks in primary integrated economic zoning is to focus on a whole region's national economy under guidance of the unified state plan and in accordance with the objective conditions with the region and requirements for a regional division of labor to determine the region's direction of development, goals, strategic focus, industrial structure, overall pattern of various construction endeavors, and study of regional development policies and plans, as well as coordination of economic activities among regions and within component parts of regions for economic integration. Comparatively speaking, planning of the patterns of production on the basis of these kinds of zoning is relatively scientific.

2. Principles for Integrated Zoning of the Economy

On the basis of the nature and mission of comprehensive zoning of the economy, the fundamental principles of zoning should be as follows: the existing level of development of production in the region, the main tasks faced, and the similarities in the direction of development as well as the differences in these regards in each area. Internal similarities are the foundation that gives rise to regional economies' inherent cohesiveness. Differences from other regions is the basis for regional divisions of labor throughout the country. In terms of inherent characteristics, regional zoning amounts to the rational use of these differences, making the most of strengths and special qualities of individual areas to augment and perfect the national economic system of the entire country.

Specifically, the following must be considered:

First, an integrated economic region has to have an historically-formed, characteristic economic specialization and a certain amount of all-around economic development, or else it has to have basic conditions and potential for regional specialization and overall economic development that are of national significance.

Second, the region has to have a fairly high level of development of varying size and diverse functions, an economic hub, and a relatively well developed economic nucleus area that radiates outward for some distance and that is able to organize and energize economic development of the entire area.

Third is an economic and technical relationship among all regional elements in the region that has formed historically and that will continue to form. Of particular importance is a fairly consistent flow and a substantial volume of flow for the movement of principal production elements between key cities in the region and their areas of attraction.

Fourth, as a matter of principle, primary integrated economic zoning should not upset administrative zoning and should take into consideration administrative zoning elements. When conflicts between the two are fairly great, administrative zoning should be readjusted to fit in with needs for development of economic zones.

Fifth, there should be no geographic overlapping among economic zones on the same level.

There are several issues of principle here that require further study.

First, should integrated economic zoning cover all the land in the country? Certain views believe this to be unnecessary. They advocate that economically fairly mature areas or those that will shortly become key construction areas should institute economic zoning; for the time being, other areas need not become a part of the economic zoning system. We disagree with these views. This is because the integrated economic zoning that we want to carry out now is to be based on the objective laws of regional economic development, with zoning being used to determine the overall blueprint and overall strategy for regional economic development in order to bring all economic regions gradually from immaturity to maturity and to develop from a low level stage to a high level stage rather than wait for individual economic areas to develop to a mature stage before being divided up into economic zones. Realistically, economically developed areas ought to carry out economic zoning, to be sure that they become more mature. In the course of their development, undeveloped areas, including those that are not key national construction areas, also have their own individual economic and social problems requiring solution. In the division of labor system throughout the country, they also have to shoulder national burdens large or small, or of this kind or that. We cannot push them off to the side simply because they are presently backward, disassociating them from the main stream of national development. Therefore, they must also carry out economic zoning, become a part of the national system for a division of labor, define their individual directions of development in order to help coordinate on a national scale proportional relationships for the development of developed areas, moderately developed areas and undeveloped areas, key areas, and general areas.

Second, should consideration be given to primary integrated economic zones being geographically dovetailed with the three major economic areas? This was considered in the USSR where the two major eastern and western economic areas individually include various numbers of primary integrated economic zones. Appropriate consideration should be given to this in China as well; however, this should not be the sole principle used in zoning. Because use of primary integrated economic zoning in the USSR for arranging the patterns of nationwide productivity has a fairly long history, primary integrated economic zoning networks have come into being, and the division into the two major eastern and western economic zones is used in conjunction with primary integrated economic zoning as macroeconomic regional elements in arranging patterns of productivity. Since this began only with the Seventh 5-Year Plan (1966-1970), the zoning of economic regions must consequently take into consideration the primary integrated economic zoning system that had developed earlier. Such is not the case in China. Of greater importance is that since macroeconomic region zoning is not in the same category as overall economic zoning, just as overall economic zoning is not in the same category as specialized economic zoning, geographically there is no need to impose a dovetailing of the two.

Third is how to regard the role of economic centers in zoning principles. The sphere of attraction of economic centers and the economic and technical links that have been formed with the sphere of attraction are major principles in zoning. However, in the actual application of these principles, first, one cannot make them absolutes or place undue emphasis on them. Integrated economic zoning has to focus on the spatial organization of the whole reproduction process; one cannot focus solely on the commodity circulation link. Second, one cannot confuse the sphere of attraction with the geographic sphere that general commodity circulation may reach. The sphere of attraction of an economic center is much smaller than the area that the exchange of its goods reaches. The sphere of exchange of Shanghai's products extends to virtually every part of the whole country; however, one cannot suppose that the whole country is within the sphere of attraction of Shanghai. If this were so, a single Shanghai economic region would be enough for the whole country. Third, one cannot statically look at the economic and technical spatial links that have already formed; one must statically estimate what effect the readjustment of the patterns of productivity and the structure of regional industries will have on economic and technical spatial links over the near term and the short term as well as the trends of change that will ensue from this.

Fourth, should accessibility to the sea be a principle for integrated economic zoning? I believe that zoning should take this factor into account, but it should not be a principle for zoning. China is a vast land, only one part of which fronts the sea. Objectively it is not possible for every integrated economic zone to include one or several seaports of their own. Even if the entire Chang Jiang basin and the Huang He basin were to be divided into two large primary integrated economic zones, Xizang and Xinjiang would still not have their own access to the sea.

3. Specific Division of Primary Integrated Economic Zones

Consideration may be given to dividing the whole country into the following six primary integrated economic areas, Hong Kong, Macao, and Taiwan excepted for the time being:

1. The northeast region including Liaoning, Jilin, and Heilongjiang Provinces and the three eastern leagues and one city of Nei Monggol. South central Liaoning, Haerbin, Changchun, and Jilin are the economic hub of this region, with Shenyang, Dalian, and Haerbin at its center. Marked economic specialization has already taken place in this region. Among all the regional elements in the area and between all sectors of the national economy fairly close economic and technical ties have formed. The unity and integration of the economy is also fairly marked, making it a primary class integrated economic area that is fairly mature, relatively speaking. A severe shortage of coal and electric power and insufficient coordination in the development of agriculture, light industry, and heavy industry are common problems faced. Intensification of the exploitation of energy resources in eastern Nei Monggol, eastern Heilongjiang, and around Shenyang, priority development of industries and skills that can serve in the technical transformation of heavy

industry with a corresponding bolstering of agriculture and light industry, plus making further use of the area's role as a nationwide heavy industry base is the orientation of development of this region.

2. The north China region or the middle and lower reaches of the Huang He. This includes western Nei Monggol, Shanxi, Henan, Hebei, Shandong, Beijing, and Tianjin, to form an economic nucleus centering around Tianjin for the whole region stretching from Beijing to Tianjin and Tanggu, along the Ji'nan-Qingdao railroad line, along the Datong-Pukou line and along the Zhengzhou-Loyang line and centering around Tianjin. This area already has a fairly marked regional economic complexion backed by a strong coal mining industry and based on abundant mineral resources within the region as well as on agricultural raw materials of which cotton, tobacco, tussah silkworm cocoons, peanuts, and sesame are paramount, with fairly well developed mining, raw and processed materials and manufacturing industries. Historically all the provinces in this region have had relatively close economic and technical ties. Water energy is inadequate, however, and the ecological environment is fairly fragile. Development of transportation and communications and of industrial and agricultural production is particularly not in keeping with requirements for major construction and this is a major problem requiring solution. Expansion of the scale of development of mineral resources in which the region enjoys advantages, principally the mining of coal, active development of the processing and transformation of natural resources in which the region holds advantages, good performance in the building of energy, heavy industry and chemical bases, and the completion of the infrastructure, principally transportation, attention to ecological agriculture, revival of ecological balance, the building of a benign cycle in the national economic system, and the ecological system are the main goals of the future.

3. The central China region or the middle and lower reaches of the Chang Jiang. This includes Hunan, Hubei, Jiangxi, Shanghai, Jiangsu, Zhejiang, and Anhui. Centering around Shanghai and Wuhan, the Chang Jiang delta, Daye district and Zhangzhutan district in Wuhan, and the area along the Chang Jiang in Anhui Province are the economic hubs of this whole area. This area is fairly well integrated economically, and the extent of specialization of its diversified industrial and agricultural production is also fairly high. Within the region, the north has coal energy and the south water energy; the north grows cotton and the south grows rice. The east possesses skills, capital, and human talent, and its processing capabilities are great. The west has natural resources and raw and processed materials. Economically, the eastern, western, southern, and northern parts of the region complement each other rather well. Strategic readjustments in the structure of the region's industries, using advanced technology to transform existing traditional industries, increasing the proportion of new technology industries, all-around development of the middle and lower reaches of the Chang Jiang, construction of a concentrated industrial area along the Chang Jiang, strengthening of economic and technical links among all parts of the region, and participation on a larger scale in a division of labor inside and outside the country is the future direction of development of this region.

4. The southeastern region. This includes Fujian, Guangdong, and Guangxi provinces. Centering around Guangzhou, the Zhu Jiang delta is the economic hub

of this whole region. This area neighbors Hong Kong, Macao, and southeast Asia, and overseas Chinese capital, overseas Chinese remittances, and overseas Chinese skills provide strength that can be used in construction. In this region are concentrated the country's four large special economic zones, four open cities and two open economic areas. It serves as a bridge for attracting the foreign and linking the domestic, and as a springboard for the transfer of technology and the transmission of information. It is renowned throughout the country as being a land of fish, rice, flowers, and fruit and as a semi-tropical and tropical treasure land. China's oceangoing shipping lines and its "southern trade routes" to southeast Asia and Oceania have ports in this region as their origin from which distances are shortest. "Western trade routes" that go via southeast Asia and Africa to Europe begin from coastal ports and have to head south toward Singapore first before turning westward, and navigation routes to these areas that start from ports in this region are also shortest. Thus it has an extremely favorable economic and geographic position for taking part in a modern international division of labor. Development of processing industries and commodity agricultural production for trade, industry, and agriculture; building of entrepot ports and port industries for international ocean transportation; development of finance and banking and of information industries, and of processing industries that do extensive and fine processing of high and medium quality canned food and clothing, of semi-tropical and tropical crops, and of products of the sea; electronic instruments; fine chemical industries; as well as the building at South China Sea petroleum bases of petrochemical industries and follow-on industries to form a regional economic system that faces outward from China is the future course of development in this region. Development of hydroelectric resources of the Hongshui He and the Min Jiang water system and navigation on the Xi Jiang, building of trunk railroad lines to connect the southwestern hinterland, and diversification of the structure and sources of regional energy are important requirements in solving the region's energy problems and advancing regional economic development.

5. The southwestern region. This includes Sichuan, Guizhou, Yunnan, and Xizang. Centering around Chongqing, the Chengdu-Chongqing area, the Kunming area, and the Guiyang area are the economic hubs of this whole region. This region is rich in hydroelectric power resources, vanadium, titanium, cobalt, bauxite, copper, lead, zinc, tin, mercury, manganese, cadmium, phosphate, halite, asbestos, and natural gas. The combination in a single region of mineral resources and hydroelectric resources is fairly ideal. The border region among Sichuan, Yunnan, and Guizhou provinces is also a place in which substantial amounts of coal and iron are found in combination. As compared with the eastern part of the country, this region has abundant energy and mineral resources. In comparison with the northwestern part of the country in which mineral resources are equally plentiful, the natural environment and the existing industrial and agricultural base is superior. The building of large numbers of large hydroelectric power stations as a foundation for the building in stages and in groups of integrated production bases with industries that consume large quantities of energy from diverse sources; the building of light and textile industry bases with unique regional characteristics in places that are self-sufficient in grain; the building of forestry bases that can be used in perpetuity and that have as their main purpose the conservation of water resources and that are based on afforestation; and the use of railroads as the

backbone for transportation with highways being built first, plus navigation of the Chang Jiang and its principal tributaries in combination with development of hydroelectric power will be the future emphasis in opening up the region.

6. The northwest region. This includes Shaanxi, Gansu, Qinghai, Ningxia, and Xinjiang provinces. Centered around Xi'an and Lanzhou, the central Shaanxi area, and the Lanzhou area are the economic hubs of this region. In this area, coal, water, oil, and gas energy is fairly plentiful, and there is an abundance of nickel, molybdenum, and platinum as well as beryllium, lithium, niobium tantalum, sylvite, boron, sodium, saltpeter, asbestos, and magnesium, and it is also a region of the country that is spacious and that has abundant land resources, particularly grasslands. The natural environment for the farming industry has its daunting side; on the other hand, there are long hours of daylight, strong solar radiation, high cumulative temperatures, and a great difference between daytime and nighttime temperatures that favor crop growth. The main problems are a scant population, lack of transportation, a weak economic and technical foundation, a shortage of capital, a shortage of skills, and a shortage of skilled people. Natural resources above and below the ground are a long way from having been transformed into economic strength. Making the most of grass, forests and minerals, using ecological agriculture to spur light and textile industries and to advance other industries and tertiary industries, curing poverty and becoming prosperous, gradually establishing animal husbandry, forestry, and fruit industry bases, setting up processing bases for animal husbandry and forest products as well as renowned native specialties, and establishing a basis for coal, water, oil and gas, and all-around use of superior mineral resources to set up key chemical industry bases is the course of future development in this region.

There are still several problems here requiring further study as follows:

First is expansion of the present Shanghai economic area to the two lakes [Tai Hu and Hongze Hu] to make it the central China area or the area in the middle and lower reaches of the Chang Jiang. This should be done mostly because the Shanghai economic region needs close cooperation with the areas around the two lakes for hydroelectric power and for raw and processed materials. Furthermore, transfer to the area of the two lakes of some industries that consume large quantities of electricity and raw materials would be also very convenient. Development of the area around the two lakes also requires establishment of economic links with the open city and open economic area in the Shanghai economic region, full use of the convenience that the Chang Jiang provides, its opening eastward to the sea, and better use of the Shanghai economic region's capital, technology, and skilled people.

Second, the transitional position of Shaanxi Province is fairly apparent. It may be delineated as part of the middle and lower reaches of the Huang He in terms of its basic conditions and potential plus the course of its future development. With the building of energy and bases for heavy and chemical industries centered in Shanxi, its economic and technical links with Shaanxi, Henan, and western Nei Monggol will be further strengthened. However, inasmuch as the removal of Shaanxi from the northwest region would mean that the northwestern region of the country would lack a fairly powerful economic center and a fairly well developed province that serves as a forward moving base for the economic development of the whole area and without which the formation of a regional economic network would be difficult, its inclusion as part of the northwestern region would be preferable. Similarly, were Sichuan Province to be withdrawn from the southwestern region and made into an independent economic region, similar problems would occur.

Third, development of Xinjiang and Xizang is of special strategic significance. However, were they to be made separate primary level integrated economic regions, they would obviously lack requisite conditions. For a long time to come, both Urumqi and Lhasa will be unable to stand as economic centers of a primary level integrated economic region. Therefore, they should be made respectively a part of the northwestern region and the southwestern region and where circumstances warrant, they may be made secondary integrated economic regions in the northwestern region and the southwestern region. Wouldn't such a division mean that the northwestern region and the southwestern region were too large? A look at the historical process of development of regions shows that the geographic size of a region is frequently in inverse proportion to economic strength. The size of an economic region that is economically in the developmental stage or maturing stage is frequently greater than the size of a region that is economically mature. The land area of the USSR east of the Urals accounts for three-fourths of the USSR's land area, yet it has been divided into only five primary integrated economic regions. These regions are much larger in size than the economic regions to the west of the Urals. At the present stage, the economy of the northwestern and southwestern parts of China is fairly backward, so it makes some sense for these regions to be somewhat larger. One cannot generalize as to whether it is better for a region to be larger or smaller. Of paramount importance is whether it can fairly completely give expression to the main principles of zoning, and whether it helps realize the main tasks of zoning.

Fourth is the issue of the jurisdiction in which Guangxi should be located. If one takes into account that the southwestern region is accessible to the sea, and if one takes into account the coal fields in Guizhou and eastern Yunnan, the phosphate rock and the development of hydroelectric power from the Hongshui He in Yunnan and Guizhou, the construction of railroads between Nanning and Fangcheng and between Nanning and Kunming, which will strengthen Guangxi's economic and technical links with Yunnan and Guizhou, making Guangxi a part of the southwestern region makes sense. However, a look at the historical, present, and future direction of development of the region shows economic and technical ties between Guangxi and Guangdong provinces, which are closer and more broadly based in an overall sense. In particular, when one takes into consideration the opening of China to the outside world and the effects on the pattern of China's productivity resulting from participation in the contemporary international division of labor, inclusion of Guangxi with Guangdong and Fujian provinces in a southeaster coastal economic region is more appropriate.

In passing, if one takes into consideration the undeveloped state of China's communications and transportation at the present stage, the too low a density of the road network, very great economic and natural disparities, then overall, smaller regions make more sense in helping organize regional economic activities. In addition, in view of the pattern of key construction by the end of this century and its effects on regional development, one might consider some readjustments in the foregoing zoning, zoning the country into the following 10 primary level integrated economic regions:

1. The northeast region including Liaoning, Jilin, Heilongjiang, and three leagues and one city in eastern Nei Monggol;

2. The Beijing-Tianjin-Hebei region;

3. The Shanghai economic region including Shanghai, Jiangsu, Zhejiang, Anhui, Jiangxi, and Shandong;

4. The Fujian, Guangdong, Guangxi region;

5. The Shanxi economic region including western Nei Monggol, Shanxi, Ningxia, Shaanxi, and western Henan;

6. The central China region including Hubei, Hunan, southern Shaanxi, and eastern Henan. If Sanxia Province is established, it would also be included here;

7. The Gansu-Qinghai region;

8. The Xinjiang region;

9. The Xizang region;

10. The Sichuan, Yunnan, Guizhou region.

NATIONAL POLICY AND ISSUES

VICE MINISTER URGES IMPROVING COMMUNICATIONS SERVICE

Beijing QIYE GUANLI [ENTERPRISE MANAGEMENT] in Chinese No 52, Dec 85 p 4

[Article: "Communications Enterprises Should Strive To Improve the Quality of Service"]

[Text] Yuan Baohua, vice minister of the State Economic Commission, delivered a speech at the National Forum on Communications Work. He said: All people and all sectors of the national economy are very concerned with and have great expectations on communications, transport, and telecommunications undertakings as a whole. Over the years, all comrades of communications, transport, and telecommunications departments have made great efforts which can be summarized in two phrases: 1) fast development and 2) great achievements. In the past few years, the export volume of Shanxi's coal has increased 10 million tons annually, which is a very high growth rate. Things which need to be improved can also be summarized in two phrases: 1) provide convenience for customers and 2) pay attention to safety. How can we solve problems in these two areas? A very important rule is to implement conscientiously the remarks made by Premier Zhao at the party congress when he was explaining the proposal for the "Seventh 5-Year Plan." Premier Zhao said: "We should improve the quality of enterprises by coming to grips with the two links of improving the quality of products and reducing the consumption of goods and materials. In China, enterprises' technology is backward, but management is worse. Necessary technological transformation should be carried out during the "Seventh 5-Year Plan" period, but judged from actual conditions, improving and strengthening management to raise administrative and managerial standards is of more urgent and immediate significance." We should attach great importance to strengthening the management work of transport and telecommunications enterprises.

Comrade Yuan Baohua made four concrete suggestions:

1. All communications, transport, and telecommunications enterprises should consider improving service quality and strengthening safety as the central task of enterprise management and consider improving economic results as the central task of their work as a whole. They should implement the spirit of giving first priority to quality and safety. Communications, transport, and telecommunications departments are all service departments. They should gear to the need of national economic development, conscientiously resolve the

problems of inconvenience and poor safety for the masses, improve service quality, and strengthen safety work. A general quality inspection was carried out recently. Since social demand for manufactured goods exceeds supply, some enterprises begin to ignore quality. This is not right. When we say improving economic results, we mean unifying enterprises' economic results with social results. Only when social results are placed in the first place can enterprises' economic results have practical significance.

2. Great importance should be attached to strengthening the basic work of enterprise management. Some 50,000 state-owned industrial, communications, transport, telecommunications, and construction enterprises have undergone consoldiation. Although enterprises have been accepted as up to standards after the consolidation, the basic work of enterprise management is still very weak. During the general industrial survey, many problems have been exposed in the basic work of enterprise management. Some enterprises have been accepted as up to standard after the consolidation, but they fail to fill out 50 percent of the blanks on the forms of the general survey. This very much deserves our attention. The general industrial survey serves to acquire a better picture of our national conditions and strength and therefore all blanks on the forms must be filled out completely and properly. However, with regard to our enterprises' basic work, some original records are incomplete, some measuring equipment is inadequate, and some quotas and standards are nonexistent. Leading comrades at all levels, especially enterprises' leading comrades, must attach great importance to this matter and strengthen the six basic works of enterprise management.

3. Efforts should be made to strengthen modernized management of enterprises. In other words, we should add a new step next year on the basis of enterprise consolidation and acceptance. Advocating modernized management is one of our important means to improve service quality, strengthen safety work, and tap enterprises' potential. When we carry out technological transformation, we need modernized management as a foundation. If we have modernized equipment and technology, but no modernized management, raising the technological standards of enterprises will be nothing but empty talk.

4. The management work of communications, transport, and telecommunications, like all other work, should pin hopes on reform. While carrying out decontrol and advocating flexibility, efforts should be made to do a good job in the internal economic responsibility system of enterprises to arouse fully the enthusiasm of the broad masses of staff members and workers for making a common success of enterprise management and enable our equipment and resources to be used rationally to yield maximum economic results.

NATIONAL POLICY AND ISSUES

REASONS FOR CARRYING OUT PRICE REFORM PRESENTED

Kunming YUNNAN RIBAO in Chinese 3 Jan 86 p 3

[Article by Bei Xi [0554 6741]: "Why Is It Necessary To Carry Out the Reform of the Pricing System?"]

[Text] Since last year, in accordance with the clear stipulations of the central government, we have made an important step in the reform of the pricing system and readjusted some irrational price parities by increasing prices which should be increased and reducing prices which should be reduced. This has played a positive role in accelerating the development and circulation of commodity production, increasing the supply of non-staple foodstuff to urban areas, improving the living standards of urban residents and alleviating shortages in energy supply and communications facilities. However, some comrades do not understand the situation as a whole and are used to the long time practice of unitary circulation channels and unified state prices. Therefore, they are not used to seeing market prices going up and down nor do they understand why prices vary constantly since the launch of price reform. They even begin to complain and resent it, saying that the price reform is the "idea" of a few experts. They question whether the orientation of the price reform is correct.

Are these doubts justified? To answer this question, we must first get a clear picture of the current situation of China's pricing system. In the past, due to certain reasons, we always considered the law of value as something that can be willfully restricted and transformed by socialism; we also exercised stifling control over commodity prices. Because of this plus other irrational factors left over from the old society, China's current pricing system is very confusing, which is mainly demonstrated in the following areas:

1. Price parities between different commodities are irrational. The prices of mineral products, raw and semi-finished materials, and energy resources are too low whereas the prices of processed goods are too high. Coal is the food of industry, but the price of China's coal is equivalent to only a small portion of the price on the international market. According to some local statistics, in 1983, the production cost for 1 ton of coal was about 29.82 yuan but the ex-factory price was only 23.62 yuan. Plus other expenses, producing 1 ton of coal incurred over 9 yuan of loss. A similar situation also exists in Yunnan's non-ferrous mineral products. In addition, enterprises, which use China's cheap raw and semi-finished materials and energy resources

to carry out processing, make profits whether their processing and management are good or poor because surplus products created by the mining industry are transferred to processing enterprises through an exchange of unequal value. As a result, mining and ore dressing are strenuous but not lucrative, some plants and mines have suffered losses for a long time, their staff members and workers' production and living conditions cannot be improved accordingly, and their production develops slowly, whereas processing enterprises gain good profits and develop fast in spite of poor management, backward production techniques, low labor productivity, and high cost of production. This is like "making bricks without straws" in industrial production, resulting in the stockpiling of large amounts of processed goods.

2. There is little difference between the prices of similar commodities of different qualities. Those with higher quality are not priced higher than those with lower quality. Take bicycles as an example. "Feige" 101, which is a popular brand made in Tianjin, and "Fenghuang" 12, which is made in Shanghai, are sold at 155 and 149 yuan respectively. Some non-popular brand products are much inferior than popular brands in regard to appearance and performance, but their prices are only 10 yuan lower. As a result, popular-brand bicyles are in short supply while non-popular brand bicycles are in excess supply. Take soy sauce, which is a daily necessity, for another example. There are two prices on the market. One is ordinary soy sauce, which is sold at 0.3 yuan per kg. The other is spiced soy sauce, which is sold at 0.48 yuan per kg. The price difference is less than 0.2 yuan. Yunnan Province has some traditional popular-brand soy sauce such as Tuodian Soy Sauce of Shuangbo and Tonghai Soy Sauce which require different production techniques and raw materials and have different cost of production, but it is very difficult to develop them because price differences resulting from quality differences have not been expanded.

3. The state purchasing prices of farm and sideline products are higher than their sales prices. In order to solve the historical problem of the excessively wide scissors price differential of industry and agriculture, in the past few years the state has increased the purchasing prices of farm and sideline products substantially and allowed their sales prices to remain unchanged. All these measures are necessary and correct, but they have caused a new problem. That is: State price subsidies for farm and sideline products have increased year after year. For instance, the purchasing price of rice plus processing and management fees average 0.5 to 0.6 yuan per kg and in Kunming City, rice is sold to urban residents at about 0.3 yuan per kg. Normally, when there is a bumper harvest, state burdens should be reduced. Now, the situation is just the opposite. The more bumper harvests there are, the heavier state financial burdens become and the more subsidies are required to make up the differences between purchasing and sales prices. In 1983 alone, state price subsidies cost 34 billion yuan of state revenue, equivalent to a fourth of annual state revenue. At the same time, because state financial resources are limited, it has also affected the further development of agriculture.

4. Some businesses of the tertiary industry have low fee standards and the service industry has long been run as a welfare business, resulting in a lack of vitality and slow progress and causing many areas to suffer shortages of

housing, transportation, tailoring, and bathing facilities. For instance, our housing costs only several fen per square meter for low standards and merely 1 to 2 jiao for high standards. Such housing fees cannot even cover maintenance and repair expenses. The backwardness of the tertiary industry is also an important cause of enterprises managing society, thereby hindering the improvement of the economic results of society.

The above explains that an irrational pricing system is unfavorable to planning and managing the national economy, correctly evaluating the management results of enterprises, implementing the principle of to each according to his work, unclogging the circulation of goods and materials between urban and rural areas, and satisfying the people's daily needs. Therefore, it has become imperative and absolutely necessary to reform the pricing system in a planned and step-by-step manner in accordance with the requirements for the exchange of equal value and changes in the supply and demand relation, according to the development of production and state financial capacity and under the prerequisite of ensuring gradual increases in the people's actual income. If we can basically smooth out our pricing system in a 5-year period and lay a solid foundation for China's economic revitalization in the next 10 years, our nation will be prosperous and the final beneficiary will be the broad masses of people. It is thus clear that the current price reform is by no means a "bad idea" espoused by a few experts, but a major policy to enrich the nation and benefit the people.

NATIONAL POLICY AND ISSUES

PRICE INCREASES JUSTIFIED IN SOCIALIST SOCIETY

Kunming YUNNAN RIBAO in Chinese 3 Jan 86 p 3

[Article by He Yang [4421 5017]: "Are 'Static Prices' A Superiority of the Socialist System?"]

[Text] Some comrades say: "I would rather have static prices and no raises." Others believe that static prices are the superiority of socialism. These comrades are probably not sincere when they say they "would rather have no raises." What they really want is that prices remain unchanged. They think that price reform is the same as a price increase and a price increase violates socialist principles. Equating price reform with a price increase is a sheer misunderstanding. Let us set aside this question for now. Here, I would like to discuss the questions of whether it is possible to have "static prices" in reality and whether static prices are a superiority of socialism.

As a socialist country, China naturally pursues a price policy that brings about basic stability. But stabilizing prices is not the same as freezing prices. It has two implications: 1) The general price indexes should remain generally stable; and 2) the prices of major products which affect the national economy and the people's livelihood should not be changed easily. Demanding that the prices of all products remain unchanged is improper and impossible both in theory and practice. We understand that price increases and decreases of all commodiites are determined by their value--namely, social labor time required for producing them--and affected by the supply and demand relation. When a certain commodity is in short supply, its price will go up and beyond its value. When it is in excess supply, its price will go down and even below its value. At this time, the supply and demand relation will develop toward the opposite direction. It is in this way that value and price and production and demand affect and change each other. Therefore, it is absolutely normal for product prices to vary within a certain range in accordance with the changes in the cost of production and the market supply and demand situation.

Take pork as an example. The elders all know that in history there has always been an issue of price ratio between pork and grain. Under normal circumstances, the ratio is generally 1:5--namely, the price of 1 jin of pork equals the price of 5 jin of grain. This is the reason why the peasants are willing to raise hogs and why there is plenty of pork supply on the market.

Why is it necessary to maintain this rational price ratio? In economic terms, it is because the price is determined finally by value. To raise a pig, the peasants have to feed it grain, find greenfeed for it, build a pigpin, and keep it clean of manure. When the pig is ill, they have to send for a veterinarian. The money they spent and the labor they put in is what we called necessary social labor consumed in production. If the peasants cannot get compensation for their labor and gain some profits by selling pork, their enthusiasm for raising hogs will be dampened. Our past policy was to assign purchase quotas for hogs and allow above-quota grain to be sold at higher prices, resulting in an irrational price ratio between pork and grain, one that was much lower than 1:5. The peasants calculated and felt that it was not worth the efforts; therefore, hog production was slow and market supply was reduced. Since the pork price was decontrolled, in spite of price increases, price ratio between pork and grain has become more rational as each day goes by, the peasants' enthusiasm for raising hogs has been aroused and market supply has increased. This explains that price increases and decreases are not determined by the people's subjective wishes. Instead, prices vary according to changes in the value of commodities and the supply and demand relationship.

In the past, for many reasons we considered the law of value as something that can be willfully restricted and transformed by socialism, as if the state could set prices freely without having to abide by any objective laws. But the reality is not so. The "Decision of the CPC Central Committee on the Reform of Economic Structure" made a major breakthrough in socialist economic theory by clearly pointing out that China's economy is a commodity economy based on public ownership. Under a commodity economy, China must recognize the function of the law of value. Adopting administrative means to freeze prices may prove effective for a short period of time, but long-term deviation of prices from value would cause serious effects on production and living standards and lead eventually to price readjustment. For instance, machine-made wrist-watches have been highly priced for many years. Their production cost is only a little over 10 yuan, but their sales price is over 100 yuan. Stimulated by large amounts of taxes, many provinces and municipalities have built wrist-watch plants and caused the supply to exceed the demand and many products to become stockpiled. Since coal prices have been low for a long time, many provinces and municipalities are unwilling to invest in coal mines and would rather ask the state for coal. Naturally, coal has become a product in short supply and its prices must be increased.

Some comrades cherish the memory of the price control situation before the 1970's and even believe that only that kind of practice can demonstrate the superiority of socialism. In fact, this is a misunderstanding. The law of value functions whereever there are commodities and commodity production. The difference is that in a capitalist society, due to the anarchy of production, the production and sales of various commodities are regulated automatically by the law of value through price increases and decreases. In a socialist society, due to the public ownership of means of production, the production and distribution of various major products are arranged by state plans; therefore, it is possible to use the law of value to guide the national economy through the readjustment of market prices and develop toward a correct orientation to meet state interests and satisfy the people's demands. In this sense, China's current readjustment of an irrational pricing system in accordance with actual conditions, which has caused price hikes for some commodities and price reduction for others, is not a bad thing, but a good thing. It should not be considered as a capitalist practice, but as socialist superiority brought into play.

In the past, we exercised stifling control over prices. Very little readjustment was made even when the production cost of some commodities had changed drastically or prices were obviously irrational. Especially during the "Cultural Revolution" period, the government, for fear of market confusion, ordered a price freeze which lasted for 10 years. As a result, the production of many commodities was insufficient, supply fell short of demand, and commodities were distributed according to dozens of coupons to people standing in long lines. Some commodities could never be seen on the market except for their price tags. China had to import large amounts of grain, cotton, and oil until 3 and 4 years ago. Historical experience tells us that "price stability" achieved by freezing prices through administrative means is no more than a false appearance. It is actually a "hidden price increase." At the same time, wages cannot be raised for a long time either. This does not conform to objective economic laws. It might also create confusion of economic relations.

In sum, the thought that one "would rather have static prices and no raises" is impractical. It is not feasible in real life. It is also not favorable to improving the people's living standards. In the course of price reform, outdated ideas like this should be changed.

NATIONAL POLICY AND ISSUES

PRICE REFORM IMPROVES LIVING STANDARDS

Kunming YUNNAN RIBAO in Chinese 3 Jan 86 p 3

[Article by Shen Jun [3088 3182]: "Is Price Reform Aimed To Take Advantage of the People?"]

[Text] Our purpose of reforming the irrational pricing system is to straighten out prices, achieve a benign circle of economy, and bring about healthier and more balanced economic development in China. Fundamentally speaking, it is for the interests of the people. But when some comrades saw that prices increased for some commodities in the reform, they commented: "To put it bluntly, price reform is price increase. The fact is that the state has problems and is trying to shift them to the people."

This is a misunderstanding. We can see from the initial price readjustment carried out since 1978 and the actual conditions of reform that price reform is to carry out structural readjustment, adjust irrational price ratios, reduce prices that should be reduced, and increase prices that should be increased. Not all prices have been increased. As for state problems, the fact is that everybody can see and feel how good the current political and economic situations are in China. In the past 7 years since the 3d Plenum of the 11th CPC Central Committee, an excellent political situation of stability and unity has been brought about gradually, the economy has become increasingly vigorous, the task of striving to achieve a fundamental turn for the better in the financial and economic situation has been basically fulfilled, and the national economy as a whole has entered a stage of steady, sustained and balanced development. In 1984, China's total industrial output value exceeded 1 trillion yuan, an increase of almost 1-fold over 1978. China reaped a great bumper harvest for 6 consecutive years. In 1984, China's per-capita grain output reached the world level of 400 kg. Commodity circulation has developed rapidly and the situation of slow production development and slow improvement of the people's living standards over the years has also been reversed fundamentally. As far as Yunnan Province is concerned, great achievements have been scored in economic development and other socialist undertakings and prospects are very good. The economy has increased steadily and continuously. In the past 4 years, the gross value of industrial and agricultural output on the average increased 11.1 percent a year; the national income, 10.9 percent; the retail sales of social commodities, 14 percent; and revenue, 17.3 percent. After the readjustment of industrial lineup in the past few years, the ratios between industry and agriculture and between light and heavy industry have gradually become balanced. The ratios between accumulation and consumption and between production and construction have also become rationalized. Initial changes have been made in the closed-door economic system. Urban and rural areas have witnessed the prosperous phenomenon of the common development of various economic forms. The masses' living standards have been continuously improved. Such an excellent situation has been rare in the past 36 years since the founding of new China. Judged by the country as a whole, things are not getting worse but better than ever. We are now advancing toward the comfortably well-off level. There is no need to take advantage of the people. Of course, the state does have some problems. For instance, during a certain period of time, too much currency was put in circulation, the scale of capital construction was overextended, and credit and consumption funds increased sharply. All this has created some problems, but they are only minor problems that arise in the course of advance. The state is working on them. Some have already been solved to certain degrees. Therefore, there is absolutely no need to take advantage of the people.

We understand that the current pricing system still has many problems and that the reform is a must if we want to develop the national economy in a healthy and continuous manner. However, the price issue concerns the relations of economic interests among the state, collectives, and individuals, among different individual laborers and among different economic organizations. It has a vital bearing on the daily life of millions of people. Without the basic guarantee of a stable and united political environment and the precondition of an excellent economic situation and certain material foundations, it will be impossible to carry out the reform of the pricing system. During the period when "the class struggle was considered as the key link" and endless political movement was carried out, price reform was of course out of the question. During the period when thousands of people took to the street to "do away with the party committee to carry out revolution " and to stop production and schooling to "carry out revolution," goods and materials were scarce and the national economy was on the brink of collapse, not to mention the reform of the pricing system. The only solution then was to freeze prices and issue various kinds of ration coupons. It is the foundation and support of the current excellent situation that made it possible to carry out the reform of the pricing system. Our current reform of an irrational pricing system is to carry out voluntary price readjustment to bring about healthier and more balanced economic development during a period in which production is developing and the people's living standards are improving. It is totally different from the situation in which crisis was shifted to the people through passive runaway inflation and all-round price increases resulting from the worsening economic situation that once occurred in China before the liberation and in foreign history.

A basic principle for our price reform is to guarantee that the actual income of the broad masses of urban and rural residents is not reduced because of price readjustment. After the decontrol of pork prices, Yunnan Province issued a certain amount of price subsidies to urban residents in order to guarantee that the people's actual living standards do not decline because of the decontrol. From January to October 1985, Yunnan Province issued 66.27 million yuan of meat subsidies to the residents. The figure was estimated to reach 89.3 million yuan by the end of 1985. To reduce the people's expenses on meat, poultry, eggs, vegetables, and coal, state financial departments also issued loss subsidies to food, poultry and egg, vegetable, and coal companies. It is estimated that this year Yunnan Province will spend a total of 170.2 million yuan for the subsidies of policy-related money-losing commodities and for the meat subsidies of the residents, an increase of 71.41 million yuan over 1985. Of course, in the course of price readjustment, it is impossible to subsidize everything. For instance, the prices of some fresh and live commodities will increase slightly during the initial period of price decontrol. For another instance, the prices of low-priced, small commodities will also increase after the decontrol, but after awhile, there will be more commodities on the market and the prices will drop back to the original level. This is what we called market mechanism and regulation. Because of this, we cannot deny that readjusting the prices of some products can directly and indirectly make the price indexes of retail sales go up within a certain period of time. The state has managed to keep the increase of the price indexes of retail sales under the lowest limit. At the same time, the state should make appropriate arrangements to increase the income level of the people. Following the 3d Plenum of the 11th CPC Central Committee, the party and the government readjusted workers' wages on a relatively large scale on four occasions in 1979, 1981, 1982, and 1983. In 1985, wage reform was carried out on the prerequisite of raising wages for all staff members and workers. Since this wage reform is aimed at gradually establishing a rational wage system and workers pay will not increase substantially, the scale of price readjustment is also limited. We are taking small steps, one step at a time. We know that the prices of some products are irrational, but we will not readjust them for the time being. At the same time, the state has also strictly stipulated that no one and no unit is allowed to take advantage of the reform and increase prices indiscriminately to encroach upon consumers' interests; if they do, they will be dealt with severely.

In sum, if we must say that price reform is aimed at the people, we may say that it is aimed to benefit the nation and the people and guarantee that the people's living standards will not decline but improve continuously.

NATIONAL POLICY AND ISSUES

VICE MINISTER URGES FULL USE OF EXISTING EQUIPMENT

Beijing QIYE GUANLI [ENTERPRISE MANAGEMENT] in Chinese No 52, Dec 85 pp 5-6

[Article: "Fully Develop the Potential of Existing Equipment"]

[Text] Zhao Weichen, vice minister of the State Economic Commission, delivered a long report at the National Forum on Communications Work which was held recently. After reviewing the current situations of communications, transport, and telecommunications and analyzing the situation of the "Seventh 5-Year Plan" period, he addressed in particular the several tasks that need to be done well in the "Seventh 5-year Plan" period:

1. Increase Transport Capacity and Make Proper Arrangements for the Transport of Major Goods and Materials and Passengers

In the first few years of the "Seventh 5-Year Plan" period, all areas and departments should on the one hand do a good job in construction to increase capacity and on the other hand strengthen technological transformation and equipment upgrading of existing railways and harbors, adopt emergency measures to increase the traffic capacity of bottle neck areas, rush to repair some coal transit lines, traffic diverting lines, and connecting lines, as well as merge and yield stops, step up efforts to manufacture some locomotives and freight and passenger cars, speed up the transformation and construction of some berths, expand lighter tranport operations, strengthen the organizational work of transportation, make full use of highway, inland waterway, and air transport, tap potential, and strive to increase passenger and freight volume.

Transport arrangements should be made according to the principle of making all round arrangements with consideration for both passengers and freight and taking into account general tasks with key ones guaranteed. The transport of coal, petroleum, grain, steel products, timber, cement, light and textile products, market supplies, and import and export commodities, which affect the national economy as a whole, should be considered as key tasks and arrangements should be made accordingly. Best possible arrangements should also be made for the tranport of other goods and materials.

2. Do a Good Job in Reform and Allow Further Decontrol and Flexibility

Prority must be given to reform in order to accelerate the development of transport and communications.

A. Do a good job in streamlining administration and decentralizing power to increase the vitality of enterprises. In reform, railway and posts and telecommunications departments should correctly handle the relationship between centralization and enterprise flexibility. The dispatch and control of railway transportation and the posts and telecommunications network should be centralized while enterprise administration and management must be decentralized and flexible. Water, highway, and air transport departments have decided to separate government functions from enterprise management. Efforts should be organized to carry out this decision in a step-by-step manner. Administrative departments should gradually shift their main energies from enterprises directly under their control to industrial management, strengthen macro-control, and render better service. Harbors and navigation [illegible] should be placed under separate management, railway stations and transport brigades should be separately established, and airports and airlines should be separated. Conscientious efforts should be made to lower the administrative level of the harbor system. There should be only one harbor administrative bureau for each harbor city to avoid confusion created by multiple administrative departments. When carrying out the reform of enterprise system, all areas and departments should first let enterprises have the powers to which they are entitled.

B. Continue to relax rules and allow more flexibility to arouse the enthusiasm of all fields. Efforts should be made to encourage everybody to engage in the construction of transport, posts, and telecommunications facilities. Except for transport, posts, and telecommunications departments, all trades and professions are allowed to take up this undertaking alone or with cooperative efforts under the guidance of state plan. The state, localities, departments, and enterprises should make concerted efforts and raise funds through various channels such as loans, pooled funds, and foreign capital to build railways, wharfs, highways, airports, and posts and telecommunications facilities and purchase vehicles, ships, and airplanes. With regard to Chinese-foreign joint ventures for the construction of harbors and wharfs, policies should be relaxed, the time limit of the joint venture may be allowed to exceed 30 years, and preferential tax treatment may be granted. With regard to private wharfs and other special facilities built by enterprises, whoever built them should control and benefit from them. Loans used to build expressways, first-grade highways, high-standard second-grade highways, bridges, and tunnels may be repaid by collecting fees.

Transport monopoly and departmental and regional barriers should be eliminated. The state, collectives, and individuals should be encouraged to engage in transport business at the same time and compete with each other. Such facilities as harbors, river ports, airports, and railway stations should be socialized to serve all vessels, vehicles, and airplanes engaged in transportation.

C. Strengthen legislation and do a good job in control. Pertinent laws and regulations should be formulated for the development of transport, posts, and telecommunications undertakings so as to exercise control according to law and protect the enthusiasm and lawful rights and interests of all trades and professions for developing transport and communications. It is necessary to strive to establish, within 2 to 3 years, organic laws concerning railways, highways, harbors, aviation, and telecommunications and formulate urgent rules and regulations concerning the contracts of freight transport and joint transportation. Before national laws and regulations are promulgated, local laws and regulations may be formulated in all areas in accordance with local reality and reported to provincial (autonomous region or municipal) people's governments to be approved for implementation.

3. Do a Good Job in the Rational Division of Labor Among Different Modes of Transportation

Rational division of labor should be carried out in the development of various modes of transportation. To organize rational division of labor in transport, it is necessary to pay attention to developing the advantages of "long distance, large volume, and heavy load" in rail transport and the advantage of flexibility in highway transport, make full use of river transport, and attach great importance to the development of civilian air transport.

4. Strengthen Control and Strive To Improve the Quality of Transport and Communications Services

Currently, rough handling of cargoes, ill treatment of passengers, and mail delays and abandonment still happen now and then. All areas and departments should vigorously consolidate and develop the results of enterprise consolidation and strengthen basic work. Conscientious efforts should be made to organize the people to implement the eight measures put forward by the "Circular on Strengthening the Work of Improving the Quality of Freight Transport in a Comprehensive Manner" issued by the State Economic Commission. Those who incur losses due to illegal operations and rough handling of cargoes should be carefully investigated, dealt with severely, and held responsible for the compensation of the losses. Those who abandon leadership and neglect duties should be investigated and held responsible. Those who are rude toward passengers and those who deliberately delay and abandon mail should be promptly investigated and punished. Unhealthy tendencies such as concocting various pretexts to collect fees and jack up prices indiscriminately under the names of reform and flexibility should be corrected immediately. Illegal activities such as using one's powers for illegal sales of railway carriages, cabin seats and tickets, giving or receiving bribes, blackmail, graft, and embezzlement should be banned resolutely.

5. Develop Local Communications

For some time to come, efforts should be concentrated on transforming main economic highways, highways entering and exiting large and medium-sized cities, highways diverting traffic from harbors, railway stations, and areas where passenger and freight traffic is heavy; the dead ends of trunk lines should be openned up and connected to other roads; ferries should be changed to bridges step by step; and highways of relatively high standards should be built to speed up road construction in old revolutionary bases and minority, border, and impoverished areas.

To develop inland navigation, attention should be paid to harnessing and developing river courses and removing lock gates and embankments that obstruct navigation to improve navigation conditions. It is necessary to develop new-style boats and ships, replace wooden ships and technically backward ones, and popularize the use of push barges. Local areas may use their own investment, join investment with central departments or use their investment plus a proper amount of state subsidies and take advantage of favorable local conditions in regard to dismantling, removal, land purchase, and recruiting to carry out local railway construction.

6. Vigorously Develop Container and Joint Transport

Efforts should be made to see to it that by the year 1990 all export goods suitable for container transport are basically transported by containers and that 5-ton containers are widely used on main domestic transit lines.

7. Speed up the Development of Posts and Telecommunications

Various means and technology should be used to develop posts and telecommunications through different levels in a step-by-step manner. Great efforts should be made to strive to alleviate the shortage of posts and telecommunications facilities within a relatively short period of time.

JINGJI RIBAO OBSERVER COMMENTS ON INDUSTRIAL DEVELOPMENT

HK021304 Beijing JINGJI RIBAO in Chinese 28 Apr 86 p 1

[Observer's article: "Take a Cool and Positive Attitude Toward the Current Rate of Industrial Development"]

[Text] Some noticeable conditions have appeared in our country's industrial production during the 1st quarter of this year. Industrial output in January surpassed that in the same month of last year by 5.6 percent (output in December last year was 10.2 percent more than that in December 1984) but dropped by 5.6 percent as compared with December last year; output in February was 0.9 percent higher than that in the same month of last year but continued to drop as compared with that in January this year; and the national average output in March rose by 6 percent as compared with that in the same month of last year; but various regions differed greatly from one another in output. What attitude should we take toward this "small fluctuation" in this year's industrial growth rate and what lesson should we learn from it? This is an important question concerning our assessment of the current economic situation and our correct guidance over economic work.

On the one hand, sufficient attention should be paid to the decline in growth rate. The growth rate has lowered a bit too much in the first 2 months of this year. This excessive decline should not be mistaken as a normal effect of the macroeconomic policy and therefore regarded as unimportant. Many regions have promptly studied the reasons for the decline in growth rate and adopted practical measures to organize production and maintain a certain growth rate. This is utterly essential. We should not set unrealistically high targets. However, while improving economic benefits and coordinating the proportions, we should strive for a considerably high growth rate. A high or low economic growth rate is an important indication of the good or poor economic situation of a country. This year is the 1st year of the Seventh 5-Year Plan period. It is necessary for industrial production to maintain a certain growth rate, whether judging from the point of accomplishing the Seventh 5-Year Plan or accomplishing this year's plan, and whether judging from the point of satisfying the needs of the current national construction and the people's growing livelihood demands or from the point of promoting the reforms and consolidating and developing the excellent economic situation.

On the other hand, there is no need for alarm at the temporary decline in growth rate. It should be recognized that the current general situation of industrial production is good. According to an estimate by the relevant department, although the growth rate in February this year was a bit low, the aggregate total output value of January and February accounted for 13.9 percent of this year's total output value. This percentage is not small at all compared with those in many past years. This shows that we still can fulfill and may even overfulfill this year's state plan as long as we draw effective measures and grasp them tightly. Furthermore, in January and February this year, the average growth rate of industrial production as a whole was relatively low, but the situation of production of energy, raw and semi-finished materials, and readily saleable goods was quite good, state revenue was satisfactory, and there were adequate electrical appliances for the whole year. These are favorable conditions for us to maintain a certain growth rate and to accomplish the state plan. One may fail to see the formidable conditions and, in view of the temporary drastic decline in growth rate, may make pessimistic estimate of one sort or another of our country's industrial development. This is incorrect. If we are frightened out of our wits and, as we did before, try to force the lower levels to fulfill the output targets and do a rush job of attaining our output quotas regardless of consequences, then we can only encourage falsity and formalism and can neither have a really high growth rate nor obtain substantial economic results.

Some people hold that with the general decline in growth rate it is better to change the fundamental orientation of the macroeconomic policy which has been carried out over the past year and to relax the control over the general social demands. This viewpoint is open to question. Our country is carrying out its modernization program on a large scale. With a population of more than 1 billion, it is a big country and rather poor. It has a very wide market, which has a huge demand for goods. Most of its natural resources are lying dormant under the ground without being explored and used. Most of the mountainous areas are separated from one another by high mountains and have very poor transportation facilities. In addition, the old managerial system is still playing a role to a certain extent. Therefore, in our country, the imbalance between total supply and total demand often finds expression in the drastic increase in demand, that is, the total demand surpassing the total supply, which is limited by resources and funds. We must consider these special conditions of our country when we decide on measures to cope with the decline in growth rate. The output of energy and raw and semi-finished materials continued to grow in January and February of this year. However, the short supply of energy and raw and semi-finished materials remained an important cause of the decrease in production or the drastic decline in growth rate in some regions. Large quantities of energy and raw and semi-finished materials have been used by the capital construction, which continues to expand in scale. In this sense, the "decline" in growth rate at the beginning of this year was actually the aftermath of the "exceedingly speedy development." In solving questions in this connection, we still have to adhere to two prerequisites: First, improvement of economic results and social benefit; second, the "four impassable restrictions," that is, capital construction funds, credits, foreign exchange, and consumption funds. We must see that the momentum of excessive investment over the past 2 years has now slowed down a bit, but the problems have not yet been completely solved and many localities and units are still blindly embarking on new projects, thus creating the hidden danger of continuous expansion of the scale of investment. For this reason, we must not relax macroeconomic control. If we relax macroeconomic control and increase the demands, then the hidden danger of an increase in investment will lift drastically and the "exceedingly speedy development" will reappear before long.

In view of the "exceedingly speedy development" which began to show itself in the winter of 1984, the state adopted the policy of strengthening macroeconomic control of the total demand and exercised control by means of "soft landing" instead of "emergency braking." Undoubtedly, it was entirely correct for the state to do that. However, there were shortcomings in macroeconomic control over the past year and more: Some localities applied the brake too quickly; some localities exercised control by administrative means and by "quietly restoring" the rights and interests which they had relegated to the enterprises during the reform; in tightening the money market and controlling foreign exchange and supply of raw and semi-finished materials, there existed the phenomena of demanding "uniformity" and some of the raw and semi-finished materials in short supply were also put under control. Some methods of administrative control were actually the ones that had been adopted for readjusting the old system. An investigation of some 200 enterprises in Shanghai reveals that the restoration of decisionmaking power from enterprises in some degree is an important factor of the decrease in production or the excessive decline in growth rate in the first 2 months of this year. This shows that all we need is to seriously sum up experience and improve macroeconomic control instead of relaxing it. The State Council recently formulated regulations on further promoting lateral economic cooperation. Its purpose was to clarify the orientation of and pave the way for improving macroeconomic control.

In short, in handling the question of growth rate, we must be cool-headed, realistically analyze the causes, and actively work out countermeasures, so as to solve problems in a down-to-earth manner and raise our economic work to a new level.

HUBEI ACTING GOVERNOR GUO ZHENQIAN'S REPORT

HK100222 Wuhan Hubei Provincial Service in Mandarin 1000 GMT 9 May 86

[Excerpts] Acting Governor Guo Zhenqian pointed out in his report on the draft of the province's Seventh 5-Year Plan that during the period of the plan it is necessary to focus on improving product quality and reducing material input in strengthening enterprise management and promoting technological progress. An appropriate industrial growth rate should be maintained under the premise of raising economic results.

He said: Improving product quality should be listed as an important content of the enterprise economic responsibility systems and be linked to the workers' material interests. The large and medium enterprises should take the lead in his respect.

He pointed out that improving product quality and reducing material input are to a very large extent decided by an enterprise's technological transformation. The following are the focal points in technology transformation: 1) Large and medium enterprises with a bearing on the overall picture of the national economy; 2) backbone enterprises that play a leading role in a particular sector, and enterprises that earn foreign exchange through exports; 3) the machine-building and electronics industries. We should apply new technological fruits from all over the world and import advanced management methods to transform our traditional industries.

He said: We must readjust the industrial production structure and the product mix and speed up the development of weak industrial sectors. The province's economy and raw materials industries must be strengthened. At the same time, we must vigorously develop the food and fodder industries and the high and textile industries. We must give these industries priority in loans, foreign exchange, energy raw materials, and transportation, to support their development. [Paragraph as received]

Comrade Quo Zhenqian pointed out in his report: During the Seventh 5-Year Plan the province must strive to increase exports and earn more foreign exchange. Under this premise, we should also expand imports.

He said: In expanding foreign trade and increasing our ability to earn foreign exchange from exports, we must start with the production of export commodities. We must step up the construction of production bases, special plants, and special workshops for export commodities, establish an export production structure and put it on a sound basis, and gradually form a relatively stable source channel of export commodities.

While developing exports of traditional commodities, we should vigorously develop new export goods and raise exports of machinery and electrical goods to an important position. In the latter period of the Seventh 5-Year Plan, we should put on the international market a variety of mass-produced competitive products.

He said: In expanding exports, we should on the one hand grasp production of export commodities and on the other actively open up the international market. We should also import advanced foreign technology, software, and key equipment items. The channels for using foreign investment should be further widened. We should actively open up new ways to tap the potentials of the province's non-trade foreign exchange earnings. The province has abundant tourism resources and very good conditions for developing international tourism.

During the Seventh 5-Year Plan, we should, in our foreign affairs work, open up some more windows for developing external economic and technological cooperation. Thus our foreign affairs will provide still better service for economic construction and social development.

Comrade Guo Zhenqian said: Economic invigoration must depend on the progress of science and technology. We must grasp science and technology development as a focal strategic point during the Seventh 5-Year Plan, bring the entire national economy onto the track of scientific and technological progress, and strive for a breakthrough.

Hubei has accomplished more than 1,000 important fruits of science and technology in recent years, but we have not done enough in popularizing and applying them. We must take effective steps to convert these fruits into direct productive forces as quickly as possible.

During the Seventh 5-Year Plan, we must attach as much importance to education as we do to economic construction. Spending on education during these 5 years will amount to 4 billion yuan, an increase of 60 percent over the Sixth 5-Year Plan. The provincial CPC Committee and government regulations on increasing education spending must be implemented by the government at all levels.

HUBEI'S GUO ZHENQIAN URGES IMPROVED LIVING STANDARDS

HK110225 Wuhan Hubei Provincial Service in Mandarin 1000 GMT 10 May 86

[Excerpts] Comrade Guo Zhenqian stressed in his report on the draft of the province's Seventh 5-Year Plan that Hubei must develop literature and art, radio and television, journalism and publishing, public health, and sports, so as to invigorate the masses' revolutionary spirit.

He said: Social benefit must be the supreme criterion for literature and art work. Writers must strive to create good works that reflect the four modernizations drive and the mood of the era. We should further readjust, reform, consolidate, and improve the professional arts performing troupes, add more cultural facilities, and do a good job in running libraries, cultural centers, and museums.

In order to improve radio and television reception in mountain counties, we should complete the construction of four main microwave links in the province. The transmitting power of key stations in northwestern and northeastern Hubei should be increased in a planned way. We should also build a number of satellite receiver stations.

A peak number of people will be entering marriageable age during the Seventh 5-Year Plan. It is essential to assign an important position to family planning work, make a success of bringing up chidren in the best way, and properly control population growth.

Acting Governor Guo Zhenqian pointed out that the living standards of urban and rural people will continue to increase during the Seventh 5-Year Plan as production develops and economic results improve. At present the province's level of industrial and agricultural production and labor productivity are low. The growth in consumption must be lower than the growth of production and labor productivity. Capital also has to be accumulated for national construction. Consumption cannot increase too much, otherwise the fundamental interests of the people and state will be harmed. We must clearly explain this reasoning to the masses, and ensure that they continue to carry forward the revolutionary tradition of waging arduous struggle and building the country with diligence and thrift.

Of course, we should exert all possible efforts to solve an outstanding problem related to the masses' daily life. We must do our best to place the newly-grown laborers in jobs, and work hard to solve the drinking water problem in the urban and rural areas.

GANSU PEOPLE'S CONGRESS SESSION OPENS 6 MAY

HK070147 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 6 May 86

[Excerpts] The fourth session of the Sixth Gansu Provincial People's Congress opened in Lanzhou on 6 May. Present were responsible comrades of the party, government, and army including Li Ziqi, Huang Luobin, Wang Luobin, Wang Bingxiang, Liu Bing, Jia Zhijie, Lu Kejian, Dong Zhanlin, Pei Jiuzhou, Ge Shiying, Guo Hongchao, Liu Shu, Lu Min, and Zhang Wule. Li Dengying, chairman of the provincial People's Congress Standing Committee, declared the session open at 0900.

Vice Governor Hou Zongbin delivered a government work report. He said: The province fulfilled and overfulfilled the main targets for the Sixth 5-Year Plan. The report was in three parts: 1) on the execution of the Sixth 5-Year Plan and a review of government work in 1985; 2) on the goals of endeavor and the main construction guidelines for the Seventh 5-Year Plan; 3) on the tasks of 1986.

He said: To ensure the fulfillment of the tasks and goals of endeavor for the Seventh 5-Year Plan, we must have a clear understanding of the following main guidelines for construction:

1. Put reform in the first place and ensure that reform and construction match and stimulate each other.

2. Control the scale, readjust the structure, guarantee the key points, and attach importance to economic results. We must do a good job in comprehensively balancing overall social supply and demand.

3. Develop the rural economy with the aim of enriching the masses. We should follow the path of planting grass and trees, invigorating agriculture and animal husbandry, promoting diversification, and making the people rich.

4. Do a good job in the technological transformation and the modification and expansion of existing enterprises and follow the path of expanded reproduction by mainly relying on internal factors.

5. Develop lateral economic ties and stimulate various types of joint undertakings.

6. Promote the progress of science and technology and pay attention to exploiting brain-power.

7. While promoting the building of material civilization, we must vigorously step up the building of socialist spiritual civilization.

Hou Zongbin said: The period of the Seventh 5-Year Plan is a key period in all-round reform, in economic and social development, and in the enrichment of the masses. The guiding idea for the province's economic and social development for this period is to promote reform, base our efforts on transformation, open the doors wide, organize development to enrich the people, rely on the progress of science and technology, continually improve economic results, speed up the pace of economic and social development, strive to achieve the first doubling 1 year ahead of schedule, and lay the foundation and create a reserve force for all-round invigoration of Gansu's economy during the 1990's.

The province's economic and social development must be focused on agriculture, communications, energy, raw materials extraction, the processing industries, and science and technology. In economic pattern, in accordance with the inherent economic ties and the principle of integrating economic, social, and ecological benefit, we should gradually form an economic pattern with local characteristics with the five cities of Lanzhou, Tianshui, Jinchang, Xiayuguan, and Baiyin as its props.

The province's main targets during the Seventh 5-Year Plan are as follows: Industrial and agricultural output value should reach 24 billion yuan, rising at an annual average of 8.4 percent. This includes output value of 5.5 billion yuan in agriculture, rising at an annual average of 5.6 percent; output value of 5 billion yuan in light industry, rising at an annual average of 10.4 percent; and output value of 13.5 billion yuan in heavy industry, rising at an annual average of 9 percent. Gross domestic product should reach 19 billion yuan, rising at an annual average of 10 percent. National income should reach 15 billion yuan, rising at an annual average of 8.4 percent. Financial revenue should reach 2.18 billion yuan, rising at an annual average of 6 percent. Retail sales volume should reach 9 billion yuan, rising at an annual average of 10.3 percent. Foreign exchange earnings from exports should reach $150 million, rising at an annual average of 16.2 percent. Workers' wages should rise at an annual average of 4 percent, and average peasant net income should increase to over 400 yuan, rising at an annual average of 9.3 percent. We must solve properly the problems of food and clothing in areas in difficulty.

Vice Governor Hou Zongbin stressed in his report: We must put reform in the first place during the Seventh 5-Year Plan and ensure that reform and construction match and stimulate each other. The Seventh 5-Year Plan is a reform plan. We must uphold the orientation of reform and take steady steps in reform. The various reform measures must be properly coordinated, to ensure and promote the stability and development of the entire economy. The following are the main aspects of economic structural reform during the Seventh 5-Year Plan:

1. Continue to take external and internal measures to further invigorate the enterprises, especially the large and medium enterprises owned by the whole

people, to ensure that they will truly turn into socialist commodity producers and operators making their own operational decisions and being responsible for their own profit and loss.

2. Further develop socialist planned commodity markets and gradually perfect the market setup.

3. Improve the handling of the relationship between macroeconomic control and microeconomic invigoration. While continuing to invigorate microeconomic activities, we must organize coordinated reforms in planning, prices, finance, and the labor wages system, and strengthen indirect macroeconomic control. We should gradually succeed in applying economic and legal measures and bringing into play the role of various economic levers, and also take the necessary administrative measures to regulate production and demand, the better to bring into full play the economic results of the enterprises and society.

4. In rural reforms, we must consolidate the results already achieved, retain what is beneficial, and eliminate the defects. We should focus on solving a number of outstanding problems in the second stage of reform, so as to coordinate them and take still greater strides.

5. Continue to reform the management systems of science, technology, and education. We must gradually change the system of allocating funds, open up a technology market, turn the fruits of science and technology into commodities, and develop integration of research and production. We should gradually put into effect graded administration of ordinary education, readjust the structure of secondary education, readjust the structure of secondary education, develop vocational and technical education, and expand the decisionmaking powers of institutes of tertiary education.

HUBEI PEOPLE'S CONGRESS SESSION HOLDS MEETING

HK131300 Wuhan Hubei Provincial Service in Mandarin 1000 GMT 12 May 86

[Excerpts] This morning, the Fourth Session of the Sixth Provincial People's Congress held its third plenary meeting at Hongshan Hall, Wuchang, to listen to the work report of the provincial People's Congress Standing Committee, the work report of the provincial People's Higher Court, and the work report of the provincial People's Procuratorate.

At 0900, Jiao Dexiu, executive chairman of the session, announced the opening of the meeting. Entrusted by the provincial People's Congress Standing Committee, Li Fuquan, vice chairman of the provincial People's Congress Standing Committee, made a work report of the provincial People's Congress Standing Committee to the meeting. Then Ma Liang, chief of the provincial Higher Court, made a work report of the provincial People's Higher Court, Zhong Shuqin, chief procurator of the provincial People's Procuratorate, then made a work report of the provincial People's Procuratorate.

The executive chairmen of today's meeting were Han Ningfu, Huang Zhizhen, Huang Zhengxia, (Liu Shuwei), (Zhang Deguang), (Zheng Shaobo), Xiong Zhenhua), and (Li Rongjiu). Seated on the rostrum at today's meeting were the other members of the presidium of the session; responsible comrades of the provincial CPC Committee, provincial Advisory Commission, provincial government, provincial CPPCC Committee, provincial Discipline Inspection Comission, and Hubei Military District; and CPC Central Committee members who are in Wuhan. The committee members who are attending the Fourth Session of the Fifth Provincial CPPCC Committee attended today's meeting as non-voting delegates. Others attending today's meeting as non-voting delegates were some NPC deputies and responsible comrades of all city and county People's Congress standing committees.

This afternoon, the financial budget and financial statement examination committee of the Sixth Provincial People's Congress held its second meeting to discuss and adopt the report on the draft of Hubei's 1985 financial statement and the 1986 financial budget which had been made by He Fulin, director of the provincial Finance Department, and to disucss and adopt the corresponding resolutions for the submission to the third meeting of the presidium.

In the work report of the Hubei Provincial People's Congress Standing Committee given at the Fourth Session of the Sixth Provincial People's Congress today, Li Fuquan, vice chairman of the provincial People's Congress Standing Committee, said: Over the past year, centered on reform of the economic structure with the stress on the urban areas, the provincial People's Congress Standing Committee has seriously performed all functions and powers stipulated by the law and further given play to its role as a local organ of state power in the course of developing socialist democracy, putting the socialist legal system on a sound basis, and promoting socialist modernization. In the report, Li Fuquan also reviewed the measures taken and achievements scored by provincial People's Congress Standing Committee over the past year in supervising the enforcement of the law.

In the work report of the provincial People's Higher Court given at the Fourth Session of the Sixth Provincial People's Congress today, Ma Liang, president of the provincial People's Higher court, emphasized: In accordance with the law, the provincial People's Higher Court must continue to severely crack down on criminals who seriously jeopardize social order and economic criminals who seriously sabotage the economy. It must work hard to develop socialist democracy, to put the socialist legal system on a sound basis, to uphold social order, and to protect and promote reform of the economic structure and the smooth progress of the socialist four modernizations.

Ma Liang said: From August 1983 to the end of 1985, people's courts at all levels throughout the province tried some 60,000 criminals cases in the primary courts and passed sentences on a large number of criminals in accordance with the law. On the whole, they cracked down on the serious criminals accurately and relentlessly and their work was sure.

Ma Liang said: In 1985, the province tried 2,960 economic criminal cases of offering and accepting bribes, of graft, and of swindle, and sentenced 3,692 economic criminals in accordance with the law. He stressed: It is necessary to continue to crack down on serious economic crime, to fully understand that serious economic crime will sabotage economic reform, opening up, and invigorating the economy and corrupt party style and the general mood of society, to lay stress on grasing the big and serious cases well, and to pay attention to investigation and study.

In the work report of the provincial People's Procuratorate given at the Fourth Session of the Sixth Provincial People's Congress today, Zhong Shuqin, chief procurator of the provincial People's Procuratorate, said: Over the past 1 year, all procuratorial organs throughout the province have seriously enforced the Constitution and the law. While they have not relaxed cracking down on serious crime, they have regarded cracking down on serious economic crime as a main task. They have stepped up investigating and dealing with big and serious cases. They have made relatively great progress in all aspects of procuratorial work. In the report, Zhong Shuqin introduced several aspects of work done by procuratorates at all levels over the past year:

1. They have conducted ivnestigations and studies, understood and analyzed the situation, and enhanced their understanding.

2. They have given prominence to the focal point, firmly grasped big and serious cases, and resolutely investigated and dealt with them.

3. The chief procurators of procuratorates at all levels have taken the lead in handling cases.

4. Procuratorates at all levels have correctly implemented the policies and enforced the law and strictly distinguished between right and wrong.

5. They have stictly dealt with the cases, served invigorating the economy and opening up, and worked hard to score achievements in dealing with the cases, in order to promote the comprehensive tidying up of social order.

Zhong Shuqin pointed out: This is the first year of the Seventh 5-Year Plan of our country. In view of this, the most basic thing is to penetratingly study, understand, and implement Comrade Deng Xiaoping's strategic guiding ideology of grasping construction in one hand and grasping the legal system in the other hand. While continuously, severely, and quickly cracking down on serious crime, we must regard severely cracking down on serious economic crime as the main task of the procuratorial organs.

SHANGHAI CPPCC STANDING COMMITTEE'S REPORT

OW121051 Shanghai WEN HUI BAO in Chinese 1 May 86 p 2

[Excerpts] Ye Shuhua, vice chairman of the Municipal CPPCC Committee, made the work report of the committee's Standing Committee to the Fifth Session of the Sixth Municipal CPPCC Committee on 22 April. Following are excerpts of the report:

Since its third and fourth sessions, this committee--under the leadership of the Shanghai Municipal CPC Committee and with vigorous support from all departments--has carried out its work at various levels, through various approaches and in various forms in the reform of economic, scientific and technological and educational structures and in the areas of opening to the outside world, building socialist material and spiritual civilization and promoting the reunification of the motherland. Being more clear-minded about its guiding thought, the committee has carried out more meaningful activities and done its work in a more practical manner, thus reaping more remarkable results.

In the past year, this committee has organized its members to conduct 12 or so special investigations and hold more than 100 special topic symposiums concerning problems related to the reform and Shanghai's construction that warranted prompt solutions. These mainly included the reform of the industrial structure, the absorption and digestion of imported technologies, the raising of funds, the reform of the higher educational structure, the rational flow of scientists and technicians, the reform of commodity prices and the management of markets.

In the past year, this committee has organized and supported the efforts of members of the various democratic parties and mass organizations concerned and personages in all circles to promote ties with Xianggang, Aomen and overseas areas. Much has been done in helping the concerned departments to develop foreign trade, promote economic cooperation and obtain capital, technologies and talented people from abroad. Last year, the total amount of foreign trade transactions and imported technologies and equipment realized through the good offices of the Shanghai Municipal Committee of the China Association for Promoting Democracy and Municipal Committee of the All-China Federation of Industry and Commerce reached US $115 million and that of the Shanghai Municipal committee of the China Zhi Gong Dang over US $150 million in investments. The other democratic parties have also done a great deal in these areas.

In the past year, this committee has continued to pay attention to ensuring the implementation of relevant policies for its members. Except for a few individual cases, all 42 private houses belonging to the CPPCC National Committee members in Shanghai and Shanghai Municipal CPCC Committee members that were taken away from them during the cultural revolution have been returned. With regard to confiscated cultural relics and books, 200 of the 221 members have had these belongings returned to them or received compensation. The relics totalled over 21,400 pieces and books 82,000 volumes. This committee has also helped speed up the implementation of policy for all others in the municipality with regard to private houses, cultural relics and books. By the end of March this year, of the 500,000 square meters of private houses occupied by others during the cultural revolution, 469,300 square meters had been returned. The total floor space of private houses belonging to overseas Chinese already returned has reached 203,600 square meters, or 98.7 percent of the total taken away from them.

In the past year, this committee has accomplished a great deal both in promoting contacts with Taiwan compatriots. Xianggang and Aomen compatriots and overseas Chinese and in propagating the principles and policies of the party and state for peaceful reunification of the motherland and the concept of "one country, two systems." To commemorate the 40th anniversary of the retrocession of Taiwan, this committee has sponsored symposiums and report meetings and organized commemoration articles. We have also helped the concerned departments in receiving more than 20 groups of Taiwan compatriots, Xianggang and Aomen compatriots and overseas Chinese. This committee has made fresh progress in developing its ties with the various government departments. Last year the municipal government General Office issued a "Circular on Promoting Contacts with the Various Committees and Sections of the Municipal CPPCC Committee," which systematically guaranteed this committee's ties with the government departments, injected added meaning to political consultation and made it easier for the members of this committee to understand the situation and offer assistance accordingly and for the CPPCC to give play to its role as a reservoir of talented people.

In the new year, our central task will be to seriously study and actively implement the guidelines of the Fourth Sessions of the Sixth NPC and Sixth CPPCC National Committee and the Fifth Shanghai Municipal CPC Congress and contribute our part in realizing the Seventh 5-Year Plan, carrying out reforms, opening to the outside world, invigorating Shanghai's economy and promoting the reunification of the motherland.

NEI MONGGOL PEOPLE'S CONGRESS HOLDS MEETING

SK090513 Hohhot Nei Monggol Regional Service in Mandarin 1000 GMT 8 May 86

[Text] This morning, the fourth session of the Sixth Regional People's Congress held its third plenary meeting to listen to the work reports of the regional People's Congress Standing Committee, the regional Higher People's Court, and the regional People's Procuratorate. Zhang Shuguang, Bu He, and other regional leading comrades attended the meeting. Hao Xiushan, executive chairman of the session, presided over the meeting.

Batubagen, chairman of the regional People's Congress Standing Committee, first delivered a work report of the regional People's Congress Standing Committee. He said: Over the past year, in order to promote the regional economic structural reform and the national economic development, the regional People's Congress Standing Committee has strengthened the local legislation work, with stress on the economic and national legislations, and has intensified the supervision of the local state administrative organs over the judicial and procuratorial organs, thus scoring some achievements in developing the socialist democracy and perfecting the socialist legal system.

In his work report of the regional Higher People's Court, Yang Dalai, president of the regional Higher People's Court, pointed out: Since the convocation of the third session of the Sixth Regional People's Congress, the regional Higher People's Court has paid attention to continually and penetratingly launching the campaign of dealing strict blows to serious criminal offences and economic crimes, to vigorously strengthening the economic judicial work, to positively conducting the civil judicial work, to conscientiously handling the appeals and petitions from the masses, to positively participating in the comprehensive administration over public security and social order, and to further strengthening the building of the cadre ranks. The general situation in this regard has been good, and the achievements remarkable.

In his work report of the regional People's Procuratorate, Wang Linzhong, chief procurator of the regional People's Procuratorate, after reviewing and summing up the achievements scored over the past year in the procuratorial work, emphatically stressed: In 1986 procuratorial organs at all levels should concentrate efforts on investigating and handling major and appalling cases in a conscientious and accurate manner and on grasping the conclusion of cases. In developing the procuratorial work, we should uphold the principle of strict law enforcement and observance in punishing law breakers.

Kong Fei, Standing Committee member of the National CPPCC Committee, attended the meeting. Among the congress executive chairmen present at today's meeting were (Zhang Chenghai), (Gao Zaitang), He Xingge, (Ji Jinghua), (Shu Jifa), (He Zhilin), (Cai Puru), and (Yang Jingbiao). The members present at the fourth session of the Fifth Regional CPCC Committee also attended the meeting as observers.

NEI MONGGOL PEOPLE'S CONGRESS SESSION CONCLUDES

SK130525 Hohhot Nei Monggol Regional Service in Mandarin 1000 GMT 12 May 86

[Summary, From Poor Reception] The Fourth Session of the Sixth Nei Monggol Autonomous Regional People's Congress concluded in Hohhot this afternoon. The session called on the people of various nationalities throughout the region to strengthen unity continuously, carry out reform, strive to fulfill or overfulfill the various tasks as set forth in the Seventh 5-Year Plan, and usher in the 40th anniversary of the founding of the region with outstanding achievements.

"Serving as executive chairmen of this morning's session were executive members of the presidium, including Batubagen, Hao Xiushan, Zhou Beifeng, He Yao, Seyinbayaer, Chao Luomeng, Butegeqi, Alatanaoqier, and Hu Zhongda. Attending and seated on the rostrum were regional party, government, army, and CPPCC leaders, including Zhang Shuguang, Bu He, Gian Renyong, Tian Congming, Cia Ying, and Shi Shengrong."

The session held that the guiding ideology, construction priorities, and basic tasks as set forth in the report on the Seventh 5-Year Plan are compatible with the regional economic and social development, and that the major targets can be fulfilled or overfulfilled through hard work. It also held that new difficulties will continue to arise, and therefore we should remain clear-headed, sum up experiences and lessons, and strive to open up a new situation in various fields of our work.

Batubagen spoke at the conclusion of the session. He expressed heartfelt gratitude to the comrades who resigned, and encouraged them to continue to support the work of the people's congress in the future. He called for efforts to successfully fulfill the Seventh 5-Year Plan and to develop Nei Monggol under the correct leadership of the regional CPC Committee with Comrade Zhang Shuguang as the secretary.

SICHUAN PROVINCIAL PEOPLE'S CONGRESS SESSION ENDS

HK121438 Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 8 May 86

[Excerpts] The 11-day fourth session of the Sixth Provincial People's Congress concluded victoriously in (Jinjiang) Hall this afternoon. During the session, the delegates earnestly listened to and examined a provincial government work report and the province's Seventh 5-Year Plan for the national economy and social development. They held serious discussions, freely aired their views, and put forth many valuable and pertinent suggestions on building material and spiritual civilizations in the province. This fully shows their concern for various reforms in the province, for agriculture, for the cultural and educational cause, and for the building of socialist spiritual civilization.

At 1500 on 8 May, Meng Dongbo, executive chairman of the session and permanent chairman of the presidium, presided over the session. A total of 1,266 delegates attended today's session, forming a quorum. Permanent chairmen of the presidium acted as executive chairmen of the session. They were He Haoju, Qin Chuanhou, Pei Chuanhou, Peng Dixian, Ji Chunguang, Liu Yunbo, Liu Haiquan, Liu Xilin, Zhaxi Cering, Wang Ao, Deng Zili, and Wang Yanli. Seated at the rostrum were members of the presidium. Also seated at the rostrum were responsible comrades of the provincial CPC Committee, the provincial Advisory Committee, the Chengdu Military Region, the provincial Discipline Inspection Committee, the provincial CPPCC Committee, and all democratic parties, including Yang Rudai, Fu Quanyou, Wan Haifeng, Nie Ronggui, Feng Yuanwei, Xu Mengxia, Yang Wanxuan, Bai Shangwu, Song Dafan, (Xie Shijie), (Xu Shiqun), (Gao Shuchun), (Wang Chenbo), (Liu Xing), (Liu Shaoyan), (Hu Maying), (Song Wenbin), (Luo Ming), (Hu Yongkang), (Han Zhenfu), (Cao Qinze), Pan Dakui, Xu Chonglin, Ren Jinglong, Tian Yiping, Li Peigan, Jamyang Phamo, Wang Daidi, Li Weijia, Zhang Guangqin, Yangling Doje, and (Wang Xuejun). Also seated at the rostrum were Ren Baige and Tianbo, members of the Central Advisory Commission; provincial Governor Jiang Minkuan; Vice Governors Gu Jinchi, Luo Tongda, Kang Zhenhuang, and Pu Haiqing; provincial government advisers Qiao Zhimin, Guan Xuesi, and (Ding Changhe); Ren Lingyun, president of the provincial Higher People's Court; Gao Zhengzhong, chief procurator of the provincial People's Procuratorate; and former responsible persons of the provincial Advisory Commission, the provincial People's Congress Standing Committee, the provincial government, and the provincial CPCC Committee.

The session adopted the provincial government work report; a resolution on the province's Seventh 5-Year Plan for the national economy and social development; a resolution on the province's national economy and social development in 1986; a final account of the province for 1985 and a budget of the province for 1986; provincial regulations on implementation of compulsory education; a resolution on the work report by the provincial People's Congress Standing Committee; a resolution on the work report by the provincial Higher People's Court; and a resolution on the work report by the provincial People's Procuratorate.

According to the election methods of the session, a provincial vice governor will be elected at the session. A candidate was named by the presidium and submitted to the delegates for examination and discussion. The presidium then held a discussion and decided to name Comrade (Xie Shijie) as the candidate for provincial vice governor. A secret ballot was held at the session. Comrade (Xie Shijie) was elected provincial vice governor.

All members attending the fourth session of the Fifth Provincial CPCC Committee attended the session as observers.

ECONOMIC PLANNING

BRIEFS

EXPORT COMMODITY CENTERS PLANNED--China plans to set up new export commodity production centers in coastal areas and areas with good transport facilities in the next five years, the overseas edition of PEOPLE'S DAILY reports today. According to the paper, these along with better coordinated separate enterprises will enable China to better compete on the international market. Over the past decade, Chinas has opened 125 export commodity production centers. In addition, more than 1,000 enterprises in the country manufacture some export goods. The paper quoted a high economic official as saying that the funds for the new centers would come from joint investment ventures and production projects and from compensation trade arrangements. In return, the foreign investors will receive finished goods as payment for imported equipment and materials. Priority will be given to centers which require relatively little investment and produce high-grade commodities to generate export income, the paper adds. [Text] [Beijing XINHUA in English 0622 GMT 6 May 86 OW] /12624

MAYOR DISCUSSES IMPROVING INFRASTRUCTURE--Gas should reach almost all homes in the city center of Beijing by 1990, compared with 71 percent now. Increased gas supply is part of a 2.92 billion yuan program to improve the city's infrastructure over the next five years, Mayor Chen Xitong told the Fifth Session of the Eighth Municipal People's Congress which opened here today. The money will be twice the figure for the 1981-1985 period, itself almost double that for the five years from 1976 to 1980, Chen said in his report on Beijing's Seventh Five-Year plan (1986-1990). Inadequate communications and other infrastructure facilities has weakened the city's ability to function as an efficient capital, hence the need to continue giving priority to such facilities, he explained. Improvements will also be made to water and electricity supply, drainage, transport facilities and posts and telecommunications. The program, now subjected for examination by the 981 deputies, calls for an additional supply of 500 million liters of water a day by 1990, and the number of telephones should increase to 500,000, from 214,000 at present. SPEED OF ECONOMIC DEVELOPMENT, REFORM STUDIED

Taiyuan JISHU JINGJI YU GUANLI YANJIU [THE STUDY OF TECHNO-ECONOMICS AND MANAGEMENT] in Chinese No 5, 1985 pp 2-7

[Article by Zhou Shulian [0719 3219 5571]: "Speed of Industrial Development and Economic Structural Reform"]

[Text] I

China's industry has developed at a superhigh speed since the end of last year. People in the academic circles hold different views on the relationship between this superhigh speed and the economic structural reform. Some comrades think that the high-speed industrial development is mainly attributed to the new economic system. The said: "The economic reform since 1978 has brought changes to the national economic system, while the continual expansion of the market system's role has enabled China to deploy its essential productive forces in a more and more rational way." "The system environment which motivated the one-sided quest for output value is gradually vanishing in the course of the reform, and the speed of China's economic growth in 1984 was by no means the outcome of a one-sided quest for output value." In their opinion, the present high speed is a special feature of the new economic system and "we should welcome instead of being afraid of the rapid economic growth." Some comrades even believe that the present speed must be maintained before we can proceed any further with the economic structural reform; otherwise, the reform will meet with difficulties. I feel that these views deserve to be further discussed.

China's industrial development which has been gathering momentum in the past several years is certainly inseparable from the economic structural reform. Because of the reform, the enterprises have acquired more decision-making power. They are now more active and more enthusiastic. Their business operation and management have been improved, and their technical transformation has been accelerated. All these are the causes of a high-speed industrial development. Improvement of the external conditions of industrial production, such as the development of agriculture, energy resources, communications and transportation facilities, foreign trade, and so forth are also inseparable from the reform. So, too, is the rapid development of collective industry. Therefore, it would be totally wrong to ignore or underestimate the effects of the economic structural reform on the speed of industrial growth. However, can we say that the present rapid growth should be mainly attributed to the new economic system? Can we say that the traditional economic system which led the enterprises to their one-sided quest for output value "no longer carries any weight"? We don't think so because, first of all, this does not conform to reality.

Let us look at this matter from the standpoint of decision-making power for the enterprises. Although some enterprises had acquired more decision-making power and become active after the reform, there are still many others which do not have the decision-making power as they should, and which are still inactive. This is particularly true of the large and medium-size enterprises, because even now, most of them do not have the necessary decision-making power and vitality. The number of large and medium-size enterprises in China is less than 2 percent of the total number, but their fixed assets and their taxes and profits account for more than 60 percent of the national totals. According to an estimate, only 15 percent of the present large and medium-size enterprises are fairly active; 65 percent of them are now in the process of changing and have not given any outstanding performance because of the lack of a solid foundation; and 20 percent of them are in some predicament and still remain basically inactive. (SHIJIE JINGJI DAOBAO [WORLD ECONOMY REPORTER] 22 July 1985.) According to a survey in Liaoning, only a handful of large enterprises are active and most of them are not, mainly because the relationship between the state and the enterprises has not been clarified, the functions of the government and the enterprises are not entirely separated, the necessary power has not been delegated to the enterprises, and some old conventions of certain departments are still tying the enterprises' hands. The factory managers of some large plants in the machine tool industry sector have complained that some decision-making power which should be delegated to the lower levels accoring to the rulings of the Party Central Committee and the State Council has been intercepted by some local administrative departments and cannot reach the enterprises. Now we must also pay attention to the practise of apportioning expenses among the enterprises. According to investigations conducted by some NPC deputies on the Jinzhou Petro-Chemical Industry Company, the Shenyang Municipal Mechanical and Electrical Bureau, the Dandong Chemical Fiber Corporation, and some other units, there are not less than 20 different categories of expenses to be apportioned among the enterprises by the provincial and municipal authorities and even by the neighborhood offices. Many enterprises still cannot have their decision-making power. Then how can we say that the traditional system "no longer carries any weight"?

Second, from the standpoint of the market's role: Although the use of the market's regulative role has produced fairly good effects in promoting industrial production and coordinating production with market as well as improving the economic results during the past several years, the role of the market mechanism cannot be over-estimated. First, the market for the means of production is still in the incipient stage. Strictly speaking, the market for many important means of production does not actually exist. One of the main difficulties experienced by the enterprises in production and business operation is the lack of reliable sources for the supply of raw materials and energy, and there is usually a 20 percent shortage of raw materials for the tasks assigned according to state plans. The enterprises always have difficulty in obtaining the means of production on the market through the channels of commodity exchange. Instead, they have to rely on personal favors, back-door dealings, bartering, and other expedients. Some enterprises prefer to have a "boss" rather than their decision-making power mainly because of the lack of a market for the means of production. If they have no "boss," it will be difficult for them to obtain the necessary raw materials and energy resources. Second, the pricing is irrational. China's pricing system is very irrational and the price reform is only beginning. It is true that the price reforms in the past several years have promoted production, and until the pricing system and the price structure have been basically reformed, it will be difficult for prices to play their full role in the rational deployment of the essential productive forces. On the other hand, it may even produce many negative effects. The blind construction and the irrational duplication of projects which now exist have led to an excessive scale of capital construction. We cannot say that the irrational pricing system has nothing to do with them. On the whole, while noting the success in the use of the regulative role of the market, we should also be aware of the existing problems. More important still, we cannot confuse the conditions and the effects of the market mechanism as they are now with what they will be under the future economic system of corporations.

Third, from the standpoint of the enterprises' responsibility for profits and losses: The profits and losses of an enterprise are now more closely related to the benefits of its workers. Among the state-owned enterprises, the practice of "eating from the same pot" still exists in the use of funds under such a responsibility system. Some foreign scholars have called "eating from the same pot" in the use of funds a "soft" budgetary restriction. Kernei [phonetic], a Hungarian economist, held that "soft budgetary restrictions" are brought about by the following conditions: (1) The enterprises are not at the receiving end of pricing; they only set the prices. (2) The "soft" taxation system. For example, the enterprises can influence the formulation of the taxation system and enjoy the preferential treatment of tax exemption or tax deferment. The tax laws are not strictly enforced. (3) The state fund allocations including the investment allocations which the recipients are under no obligation to repay; the long and continual subsidies for prolonged losses or for the encouragement of certain activities over fairly long periods; the temporary subsidies for temporary losses or for the encouragement of certain activities. (4) The system of soft credit, under which loans are granted even to those who are unable to redeem them, and to those who can postpone their redemption and other payments. (5) The external investment under soft conditions which still exist in China. For example, some enterprises have raised their prices, legally or illegally, and passed their burden on to the consumers in order to obtain more profits. China's taxation system is also a soft one, because there can be bargaining between the state and the enterprises, in addition to the common occurrences of tax evasion and other fraudulent practices. For a long time, the system of fund allocation with no repayment required has been used in capital construction. These allocations have been replaced by loans. However, these are only soft loans, because they carry low-interest rates and are repaid out of their before-tax profits (this means that the state has to pay the interest), and sometimes, even the capital cannot be recovered. As sonme comrades have said, the enterprises are now responsible for their profits, but not their losses. Some enterprises have even resorted to fraudulent means for private gains at the expense of the state. The tactics they use are many. For example, they can report a lower production cost to reduce their losses or even to turn their losses into profits; they can keep their losses, incurred through cut prices, in a permanent "pending account" instead of reporting them; they can fake sales to increase their "profits"; and they can do a lot by juggling the expenses and the nonbusiness receipts and payments. The enterprises' responsibility for their own profits and losses is one of the main features of the new system. In view of the serious practice of "eating from the same pot" in the use of funds, however, we cannot say that the traditional system "no longer carries any weight."

Fourth, from the standpoint of the enterprises' code of conduct: Some comrades believe that after the reform, the enterprises are now striving only for the output value which can be realized and the maximum profit instead of the one-sided quest for output value. This view should also be analyzed. Because of their newly acquired decision-making power and the role of the market mechanism, the enterprises now have a stronger motive for profits and the need to consider the market demand in planning production. In other words, they have to consider the question of turning their products into commodities. These good effects cannot be ignored. However, the enterprises' code of conduct under the traditional system has not been basically changed. For example, because the functions of the government and the enterprises are still unseparated, the latter's productive activities are still dictated by the administrative organs above. If the higher leadership likes an increased output value, the enterprises would still one-sidedly strive for output value. Furthermore, output value still serves as the main criterion in assessing an enterprise's performance. It is true that economic results are now emphasized. However, the assessment of economic results is fairly difficult while that of output value is simple and clearcut. For this reason, the enterprises are apt to stress the increase in output value and ignore the improvement of economic results. Particularly in the present seller's market in which supply and demand are seriously imbalanced, the increase in an enterprise's output value means an increase in its profits, and an enterprise's output value means an increase in its profits. It would be much easier to increase the output value than to improve the quality of products or to lower the production cost. That is why the enterprises usually rely on their output value as a means of increasing profits. Kernei has pointed out that in a socialist economic system, budgetary restrictions are more significant and effective than the profit incentive. He said: "The fact that the owner, the administrator, and the workers are interested in the increase in profits is not enough to determine their code of conduct. When the profit incentive is combined with hard budgetary restrictions, their efforts would be guided in the direction of actual deeds. However, when profit incentive is combined with soft budgetary restrictions, it will at least give the same opportunity for the enterprises to manipulate finances, to raise prices, and to exert their efforts to obtain 'gifts' from the state." He added: "Soft budgetary restrictions are not effective restrictions, because the financial situation of an enterprise cannot govern its conduct, and money cannot play any dynamic role. 'No matter how high the price may be, the important thing is to obtain the raw materials and manpower, and the required money can sonmehow be raised.' 'As long as we can find a contracting unit for the project, we need not stop our investment for want of funds, and any loss will be take care of by the state budget.'" (KEJI DAOBAO No 2, 1985 p 16) Under such circumstances, it would still be inevitable for the enterprises to invest blindly and to strive for higher output value. Although the State Council issued the call long ago for the speed of industrial growth to be controlled at an appropriate rate, some of the measures are still difficult for implementation. Blind quests for growth speed and the competitions in such speed still exist. These are the effects and manifestations of the traditional economic system.

If the present superhigh speed of industrial development is viewed as mainly an inconsistency of the new economic system with realities, then it would be even more wrong to call it a special feature of the new economic system. It does not mean that industry cannot develop rapidly under the new economic system, but rather that, under the new economic system, there should be no one-sided quest for high speed and no high speed without better economic results. We must note that in the past several years, the speed of industrial growth has continued to increase without corresponding improvement in the economic results. Since the end of last year, the appearance of a superhigh speed has been even accompanied by a deterioration of economic results and may possibly lead to some serious disproportion. The kind of speed we want for our industrial growth should be helpful to the sustained, stable, and harmonious development of the national economy. We want not only an appropriately high speed, but also a rational economic structure, and constantly improving economic results. The new economic system should help bring about this kind of high speed, because, by that time, the enterprises will operate independently and assume sole responsibility for their profits and losses, while the soft budgetary restrictions will be replaced by hard budget restrictions. The survival and development of enterprises will be decided by their profits and accumulation, and only through improved management and tehcnical progress can the enterprises increase their profits, their workers' wages, and their accumulation. By that time, the investment hunger and the lack of control over the consumption fund can be eliminated easily and it will be possible to create a buyer's market where supply will slightly exceed the demand. Instead of striving for high speed blindly, the enterprises will have in mind the kind of speed that is consistent with market demand and with the improvement of economic results. Only this kind of high speed can be a special feature of the industrial development under the new economic system.

Some comrades said that a high speed of economic growth would create a favorable environment for further structural reforms. Our opinion is that whether or not an environment is favorable depends on the kind of high speed. If the speed is appropriate and accompanied by a rational economic structure with fairly good economic results, then it will be really helpful to the economic structural reform. If the speed is excessive and accompanied by a lop-sided economic structure and deteriorating economic results, then such a high speed can never help, but rather obstruct, the reform. The reason is that when the economic structure is seriously irrational, the proportionate relationship is seriously disturbed, and the economic results are deteriorating drastically, the required conditions will be lacking for a comprehensive and fundamental economic reform, and in particular for those reforms such as price and wage reforms which affect very many people. For these reforms, the state must have abundant financial and material reserves and a fairly easy economic environment. Striving for excessive speed in industrial development will exert undue strain on some of the major relationships in the national economy. It will bring difficulties to the reform and obstruct certain reform measures. Many comrades have discussed this logic. The speed of industrial growth, as we can see, has been, on the whole, helpful to the reform in the past several years. However, the superhigh speed since the end of last year has created certain difficulties for the price and wage reforms. It is therefore necessary to control the speed at a suitable level in order to promote the economic structural reform.

II

To provide a fairly easy economic environment for the smooth progress of the economic structural reform, we must adopt the appropriate policies and measures to control the speed of industrial development at a normal level. As for the methods to do so, we must control, first, the scale of capital construction; second, the increase in the consumption funds; and third, the scope of credit and the issuance of currency. In addition, we must control the use of foreign exhange, make an effort to increase our exports, control our imports and use our foreign exchange to better advantage.

It should be pointed out that while taking measures to control the investment in fixed assets, the consumption fund, and the scope of credit, we must do our work well in solving the problems in a fair and reasonable way. At present, we should check the excessive speed in industrial development as our general goal. However, because many departments, areas, and enterprises are operating under different conditions, we must work out the restrictive or supportive policies according to the actual conditions and try as best as we can to avoid "applying the same arbitrary formula," in order to reduce unnecessary repercussions and losses. Along with the progress of the structural reform and the development of the commodity economy, the economic levers will play an increasingly important role. Furthermore, as the standard of economic management among the cadres at all levels continues to rise, the experience in the use of economic levers will also be enriched. Under such conditions, it will be entirely possible to lower the speed of industrial development to a normal level.

Of course, our task is not only to lower the speed of industrial development to a suitable level, but also to set up some type of social economic mechanism to guarantee the sustained and proportionate development of industry at a fairly high speed. Thus it will be necessary for the enterprises and the entire society to be concerned not only with a higher speed of industrial development, but also with better economic results in industry. According to past experiences, the improvement of economic results is more important than the increase in the speed of industrial development, because the sustained and harmonious development of industry can be realized only provided the economic results are fairly good and continue to improve. The most important task for the social economic mechanism that meets these requirements is to help in the progress of the economic structural reform. Therefore, particular attention should be paid to the following aspects:

First, the independent operation and responsibility for profits and losses of the enterprises must be treated as an important aspect of the economic structural reform. In the "Decision of the Party Central Committee Concerning the Economic Structural Reform," it is stipulated that "the enterprises must be helped to become relatively independent economic entities and socialist commodity producers and dealers who will be able to operate independently and be responsible for their own profits and losses in a true sense." Here lies the essence of the economic structural reform, because all reform measures and activities should be helpful in solving this problem. In other words, all reform measures and activities should help the enterprises to operate independently and to be responsible for their profits and losses. Great stress is being laid on the need to delegate more authorities to the enterprises and to let them make more profits in order to increase their vitality. This is necessary. However, we must also understand that issuing such a call alone is not enough, because the enterprises must also be really responsible for their own profits and losses. There are relations as well as distinctions between independent operation and responsibility for profits and losses. Enterprises certainly cannot be without independence, but they must also be responsible for both profits and losses and not for profits alone. An enterprise must be truly able to operate independently and to assume responsibility for its own profits and losses before it can truly become commodity producers and dealers. Such conditions must prevail before the enterprises can be strongly motivated to improve their economic results and to withstand the tremendous pressure in this respect, and before the state can use such economic levers as prices and credit to encourage continued efforts on the part of the enterprises to improve their economic results. Certainly, the enterprises must go through some process before it can operate independently and be responsible for their own profits and losses, but this process must be continued in the course of the reform. The reform must proceed with this as its central task, and care must be taken to prevent it from deviating from its proper path and, more important still, from going in a counter direction. There are now signs of obstruction to the enterprises being responsible for their profits and not their losses. Therefore, we must, on the one hand, keep the functions of the government and the enterprises separated, further simplify the administration, and delegate more authority to the lower levels. On the other hand, we must clearly define the responsibility of the enterprises, strictly enforce financial and economic laws, and tighten the budgetary restrictions on the enterprises. Only thus can we create an economic mechanism which can correctly handle the relationship between speed and economic result within the enterprises.

Second, the gradual formation of a buyer's market in which the supply will be slightly larger than the demand so as to encourage competition among the enterprises: Such competition is a strong motive force for the enterprises to improve their economic results. Only through competition can we restrain the enterprises from blindly striving for speed of increase in their output value, and induce them to shift the focus of their operation and management on to the path of improvement of economic results by various means. One important prerequisite for the enterprises to start their competition is their independent operation and their responsibility for profits and losses, and another prerequisite is the formation of a buyer's market. Some comrades do not believe in the possibility of a buyer's market. I do not share this view. Theoretically, it is possible for a socialist country to practise planned economy and to form a buyer's market in which the supply is slightly larger than the demand, through scientific planning and economic management. Along with the development of the economic structural reform and the improvement and strengthening of planning, and as long as we can properly control the scale of fixed asset investment and the consumption funds, we can certainly form a buyer's market in which the supply of most products will be slightly larger than the demand. From this, we can see that the policies and measures for conterolling the scale of fixed asset investment and the consumption funds are necessary not only for an appropriate speed of industrial development, but also for the formation of such a buyer's market.

Third, the establishment and strengthening of a system of scientific macroeconomic regulation and control: In order that the enterprises will truly place the improvement of economic results in the first place and properly handle the relationship between speed and result, the state has to strengthen and perfect its macroeconomic control, regulation, and management. Therefore, it is necessary to establish and continue to strengthen a system of macroeconomic control and regulation. Like the enterprises going through some process in independent operation and responsibility for profits and losses, the establishment and strengthening of a system of macroeconomic control and regulation also must go through some process, and the two processes should be closely coordinated in steps and in contents. More important still, such a system must be suitable for independent operation and responsibility for profits and losses of the enterprises. In other words, this system should help in the realization of the overall and long-range social interests and be suitable for the enterprises' code of conduct. For example, whenever the budgetary restrictions for an enterprise become rather "soft," the macroeconomic control and regulation should not over-rely on the use of such economic levers as price and credit, but rather resort to mandatory plans and administrative measures. Whenever the budgetary restrictions for an enterprises are rather "hard," then, under this system, we should attach even greater importance to these economic levers and reduce the mandatory plans and other unnecessary administrative interventions. Experiences have proved that enterprises may have different codes of conducts because of their different economic environments and other conditions. Unless the special characteristics of the enterprise's codes of conduct in different periods are taken into consideration, it will be difficult for macroeconomic control and regulation to obtain the expected results. Of course, it is possible to change the enterprises' economic environment and other conditions through macroeconomic control and regulation, and then to change certain codes of conduct among them. There is also the problem of mutual coordination of the various measures of macroeconomic control and regulation, and we should attach great importance to its solution in the course of the economic structural reform.

Fourth, a serious and in-depth study of some questions: To form the necessary social economic mechanism which will bring about a sustained and harmonious industrial development at a fairly high speed, there are many questions requiring our investigations and study. For example, what essential changes have occurred in the relationship between China's state-owned enterprises and the state during the reform in the past several years? The answer to this question concerning an assessment of the present conditions of China's socialist enterprises cannot be very specific. Some comrades said that the present superhigh speed of industrial development is mainly attributed to the new system; others attributed it to the old system. This difference of opinion should be settled by a scientific verdict on the basis of serious investigations and study. Again, what are the factors governing the state-owned enterprises' code of conduct? What were the main codes of conduct in the past, what are the main codes of conduct at present, what codes have undergone changes and what have not and for what reason? The study of the enterprises' code of conduct is a very important task. We must clarify these questions before we can work out scientific policies for macroeconomic control and regulation. Again, what are the characteristics of the state-owned enterprises' responsibility for their profits and losses, and what are the differences between these characteristics and those of collective enterprises, individual enterprises, and the enterprises of capitalist countries? We must also study such questions as: in what forms do state-owned enterprises assume the responsibility for profits and losses, what models of goals should be adopted, through what steps and stages, and what are the differences between the scopes and the degrees of such a responsibility. Again, there are such questions as what form of operations can be adopted by state-owned enterprises, what are the characteristics and strong points of different forms of business operations, and forwhat conditions are the characteristics suitable? Can socialist state-owned enterprises adopt the corporation system under which the workers of their own and other units can become share-holders? Can the ownership rights of state-owned enterprises be divided? For example, with the recognition of the state's ownership as a prerequisite, can the ownership rights of the state-owned enterprises themselves be affirmed? Can we say that while the state has the absolute ownership rights, the enterprises also have the relative ownership rights? In this connection, we have also to study the question of the ownership structure in industry, including the questions of which forms of ownership to be permitted, the trend of their development, and the principles, policies and measures to be adopted. Again, what changes have occurred during the reform in the state-owned enterprises' relations of interests, including the changes in the relations of interests among the state, the collective and the individual workers, the enterprises' long-range benefits and the causes, effects, and trend of the present changes. We should also attach great importance to the study of the way in which the state-owned enterprises should handle the various relations of interests, the measure to be adopted, and the steps to be taken in correctly handling these relations. Again, what changes have been brought about by the use of economic levers among the enterprises? How to make full use of various economic levers to regulate and control the conduct of enterprises? Because of the changes in the enterprises' conditions of operation and in their codes of conduct, the role of economic levers has also undergone changes. Then what changes have occurred, and which changes are good and which are no good for the healthy development of industry? And what policies should be adopted? Again, as the steps to be taken in the reform, how should the relationships between the promotion of the enterprises' independent operation and responsibility for their profits and losses on the one hand, and the reforms of the pricing system, credit system, and financial system on the other be handled? The enterprises' independent operation and their responsibility for profits and losses depend on the reforms of the pricing, credit, and financial systems. There are differences between them, although all reforms should be helpful in promoting the enterprises' independent operation and their responsibility for profits and losses. What have we learned from our experiences concerning these questions, what are the present problems, and how can the future reforms persist in promoting the enterprises' independent operation and responsibility for profits and losses as their central task? All these are extremely important questions.

There are still many other questions to be studied. This article has presented some views mainly in the form of questions for the purpose of "casting a brick to attract jade." The readers are invited to cortrect the mistakes.

EASTERN CHINA SOLVES REFORM PROBLEMS WITH REFORM

Fuzhou FUJIAN RIBAO in Chinese 24 Dec 85 p 1

[Article by staff reporters Lu Xiuqin [7120 0208 0530] and Huang Chuanfang [7806 0278 5364]: "Problems in the Reform of Economic Structure Can Be Solved Only by Pushing the Reform"]

[Text] "Now is the critical moment for continuing to carry out the reform. It is by no means the 'low tide' or 'cooling stage' of the reform. Problems cropping up in the reform can be solved only by pushing on with the reform." This was the unanimous view of the participants at the Second Exchange Meeting on the Reform of Urban Economic Structure in eastern China.

This meeting was held from 16 to 21 December 1985 in Fuzhou. At the meeting, leading comrades in charge of the reform of economic structure in the six provinces and one municipality of eastern China and in Guangdong and Hunan provinces exchanged information on the progress made and experience gained in the current reform of urban economic structure as well as tentative plans for carrying out the reform in 1986. They emphatically discussed the question of how to continue to push on with the current reform in accordance with the guidelines of the "Decision" and the "Proposal" of the CPC Central Committee for the "Seventh 5-year Plan." Tong Dalin, general secretary of the Chinese Society for the Reform of Economic Structure and a noted economist, was invited to deliver an important speech at the meeting.

According to the information exchanged at the meeting, in the past few years, especially since the "Decision" of the CPC Central Committee was promulgated, all provinces and municipalities have made prominent progress and breakthroughs and scored outstanding achievements in the reform of economic structure which is centered on urban reform. However, many problems still exist in the current reform.

In order to come to grips with the current reform, comrades attending the meeting unanimously held it necessary to solve the following problems: 1) It is necessary to give real priority to the reform and support and safeguard the reform spirit of daring to explore and blaze new trails. 2) To deepen the current reform, it is urgently needed to bring under control the excessively high economic growth rate so as to create a good economic and social environment for the reform. However, since the formation of a good economic environment also depends on the progress of the reform, especially the reform of macrostructure, macroeconomic environment should not be used as a general excuse for missing an excellent opportunity for continuing to carry out the reform. 3) From now on in the decontrol and invigorating of microstructure, more attention should be paid to the compatibility of macro regulation and control and the efforts to increase the flexibility and corresponding ability of enterprises. However, this is no reason to increase the direct control of the traditional system and weaken the momentum of the microeconomy continuing to develop in the direction of a new economic system. 4) New reform measures to be taken in the future must dovetail with the policy measures already adopted. Existing reform measures should be consolidated and improved to continue to push forward the whole reform. But attention should be paid to prevent going back and forth, much less going back.

YUNNAN ADOPTS MEASURES TO STRENGTHEN MACRO-CONTROL

Kunming YUNNAN RIBAO in Chinese 3 Jan 86 p 1

[Article by Chang Hanlin [1603 3352 2651]: "The Provincial Government Formulated Procedures and Measures To Strengthen Macro-control--Achieve Major Changes in the Work of National Economic Planning"]

[Text] While studying and arranging plans for national economic and social development in 1986, the Yunnan Provincial Government recently paid attention to studying procedures and measures for further strengthening macro-control and worked to have a good start in the first year of the "Seventh 5-Year Plan" to ensure sustained, steady, and balanced progress for the national economy.

Yunnan's economic stuation has never been better since the founding of the PRC, but it also has problems. For instance, the scale of capital construction is out of control, grain output has declined, the contradiction between market supply and demand is acute, and the shortage of raw and semi-finished materials is serious. In order to ensure the smooth progress of the reform, consolidate and develop the excellent situation, and strengthen macroeconomic control while further relaxing and invigorating the microeconomy, the provincial people's government recently formulated procedures and measures to strengthen macro-control in 1986.

To strengthen its macro-control of the economic situation, Yunnan must first of all adhere to the reform, achieve major changes in planning work, and focus the main energies of planning departments at all levels on studying and formulating national economic and social development strategies and major principles and policies. In accordance with the guidelines of the proposal of the CPC Central Committee for the "Seventh 5-Year Plan" and in light of Yunnan's reality, continuous efforts should be made to bring about four changes: 1) Change to further decontrol and flexibility, continue to sum up experiences and lessons in the reform, correctly handle the dialectical relation between "decontrol" and "control" and make a success of macro-control and micro-flexibility; 2) change from focusing on figures as in the past to studying strategic issues and concentrate main energies on studying development strategies, principles, and policies instead of limiting planning work to setting targets, listing projects, distributing investment, and allocating goods and materials; 3) change from considering only the balance of state budgetary funds and state-controlled goods and materials to considering the overall balance of society as a whole, exercise comprehensive control of budgetary and extrabudgetary projects, and establish a better link between economic and social developments and between growth rate and the improvement of efficiency; and 4) change from the previous practice of excessive dependence on administrative means for economic control to voluntary use of the law of value and emphasizing the use of regulatory means.

To better the construction of basic industries and infrastructure such as energy, communications, education, scientific research, and raw and semi-finished materials under the precondition that the scale of fixed-asset investment is under strict control, Yunnan must concentrate energies on key projects, control non-productive construction, carry out projects in the order of urgency and importance, and avoid doing everything all at the same time. Through planning, Yunnan should also concentrate necessary material and financial resources to guarantee agriculture, market, education, and urban infrastructure and support the economic development of impoverished mountainous areas and other important areas. On the basis of ensuring steady increase of grain output, Yunnan should further readjust the industrial lineup and give full play to its advantages in tobacco, sugar, tea, and forest and animal husbandry.

To keep the scale of fixed-asset investment under strict control, first of all Yunnan should take a further step to solve ideological problems. Cadres and the masses should unify their understanding according to the policy decision of the central government and rid themselves of such erroneous understanding as "everybody advancing side by side," "suppressing others, but never ourselves" and "depending mainly on higher-ups for control." All levels must make concerted efforts to bring the investment scale under control. Second, all areas and departments should make arrangements according to the 1986 plan (draft) which was recently formulated by Yunnan Province. No one is allowed to exceed the scale prescribed by the plan. Those who do will be held responsible for doing so. In addition, banking departments are required to exercise strict credit control and enforce strict rules and regulations; all enterprises and establishments should handle things in strict accordance with pertinent rules and regulations on capital construction, renovation, and transformation and deposit self-pooled funds into special accounts with the construction bank 6 months before they are to be used for the specific purpose. Supplies departments should strengthen the control of "three products." The state will practice unified purchase and special sales of steel products; all new projects scheduled for 1986, including collective projects in urban and rural areas, must be approved in strict accordance with the division of administrative authorities before they can be started. No project should be carried out without approval. At the same time, it is necessary to sort out and screen projects left over from the previous year which used self-pooled funds and were "exluded from four plans." Those which should be continued should be given funds and guaranteed goods and materials so that they can be completed and put into production as soon as possible. Those which should not be continued should be stopped and suspended resolutely.

LIAOWANG REPORTS ON 1ST QUARTER INDUSTRIAL PRODUCTION

HK281143 Beijing LIAOWANG in Chinese No 15, 14 Apr 86 p 6

[Article by Xu Yaozhong [1776 5069 0022]: "How To View the 1st Quarter Production Situation"]

[Text] The latest State Statistical Bureau statistics show that the country's industrial production output value for the 1st quarter of this year rose 4.4 percent. Many people in economic circles consider this a good beginning.

The increase in our country's industrial output value since 1986 began cannot be considered too substantial. Compared with the corresponding period of last year, the increase in January was 5.6 percent; in February, 0.9 percent; and in March, 6 percent. Since February, people have developed all kinds of thinking and had all kinds of talk. Some said aloud: "That is too bad. There has been a 'slide' in industrial production." Some were indifferent, as they thought it was only a transient phenomenon and that there would be "a turnaround as quickly as people respond to a beauty's charming smiles," with a high rate of growth being no problem. Others considered that some new factors had really appeared in this year's industrial production. If we could remain sober-minded and work in a down-to-earth manner, there would be the promising prospect of a proper increase in industrial production in 1986.

How should we view the situation concerning national industrial production in the 1st quarter of this year? At the national economic work conference and the national work conference on economic reform held not long ago and during the period of the Fourth Session of the Sixth National People's Congress; this reporter solicited the opinions of economic circles in various departments and areas. Most of the people concerned think that the industrial production situation this year remains good. There are three reasons why?

First, in looking at the rate of growth, we should not forget the existing base. The pace of growth in the 1st quarter as represented by output value on the surface seemed low. But we should not forget that this was in relation to the extra high rate in the 1st quarter of last year. The rate in the 1st quarter of last year was 23 percent higher than that in the corresponding period of the preceding year. Given another increase of 4.4 percent on that basis, the pace cannot be considered low. What is especially gratifying is that the energy production situation in the 1st quarter, especially electric power, was quite good. There was a fairly big increase in light and textile products that had been in short supply. The growth of rolled steel, nonferrous metals, cement, and other important raw materials was quite spectacular.

Second, in judging the pace of growth, we must make an analysis to see whether it is rational. Of durables, only radio and television sets showed a drop in production. Radios were always in plentiful supply in the past few years. A drop in output was justified. The drop in the output of television sets was chiefly accounted for by black-and-white television. This product was marked with a large accumulation of stocks in various areas. The color television sets in good demand still showed an increase of over 25 percent in the 1st quarter. Of textiles, a drop in chemical fiber output was necessitated by the readjustment of the mix of products. There had been an oversupply of chemical fibers, while the cotton cloth supply had fallen short of the needs of the domestic and international markets. So, a cutback in the output of chemical fibers and an increase in the production of pure cotton cloth was advocated by the Textile Industry Ministry. A drop in the production of large-sized machine tools, motor vehicles, and so forth reflected the initial results achieved in such macro control measures as controlling the scale of capital construction, controlling the inflation of consumption funds, and so forth. From this, it can be seen that the decreases in the output of certain products were right and proper. Such decreases did no harm but permitted savings in funds, energy, and raw materials.

Third, in judging output value, we must pay particular attention to macroeconomic results. The industrial production situation can be judged by how much output value and output have gone up. But macroeconomic results count more. In the 1st quarter of this year, due to the strengthening of management by many enterprises, product quality imrpoved and the consumption of raw materials dropped. The increase in taxes handed over to the higher levels by some areas and departments, in the profits realized, and in the earnings from sales exceeded the growth of output value. The situation concerning the state's revenue was favorable.

Of course, the situation in the 1st quarter was not all we desired. Relaxed control over ideological and political work in the process of wage readjustment resulted in the dampening of enthusiasm for production by certain workers. Different cherished ideas about the factory director responsibility system interfered with the exercise of functions by a number of factory directors and accounted for relaxed leadership over production. The same fixed standard followed in the matter of credit funds caused a general shortage of liquid funds in enterprises and produced an ill effect on the development of production. However, these problems have received the attention of the CPC Central Committee and the State Council and are being gradually taken care of. For example, concerning the problem of the factory director responsibility system, the leading comrades of the State Council have reiterated that we must continueusly uphold the system. It was clearly pointed out that factory directors have the power to employ people. On the problem of liquid funds, banks have taken four measures: 1) We must follow a policy of making distinctions in our approach to cases and granting loans on a rational basis. In granting industrial loans, we must give priority to support for the development of energy, communications, transportation, raw material-related, and other undertakings; support for the production of consumer goods suited for the market; and support for the production efforts of enterprises that earn foreign exchange as exporters. 2) Banks can grant special loans to newly-built and newly-expanded enterprises whose products are suited for the market and whose economic results are good, if they should find themselves short of funds. 3) Banks should actively help enterprise take care of accumulated stocks of goods and liquidating loans in arrears. 4) We should do a good job in providing funds where they are needed and appropriately ease credit terms concerning funds that are needed now in the development of production.

Given the implementation of these tasks and measures, our industrial production will show a steady increase or an increasingly strong performance. According to the forecast of some economists, the rate of industrial growth for the whole year is likely to be maintained at around 10 percent.

NINGXIA INDUSTRY DEVELOPS STEADILY IN 1ST QUARTER

HK300821 Yichuan NINGXIA RIBAO in Chinese 18 Apr 86 p 1

[Report: "Ningxia's Industrial Production and Transportation Developed Steadily and Harmoniously in the First Quarter of 1986"]

[Text] In the first quarter of 1986, industrial production and transportation in the whole autonomous region maintained a good situation by achieving satisfactory economic results and maintaining an appropriate growth rate. This also led to a substantial increase in exports and revenues.

In the first quarter, industrial production and transportation continued to grow steadily and harmoniously. The total industrial output value in the whole region was 555.66 million yuan, marking an increase of 8.2 percent over the same period of last year. This growth rate was higher than the national average. Light industry and heavy industry increased respectively by 6.6 percent and 8.9 percent. Output of such products as steel, aluminum ingots, calcium carbide, cement, bearings, woolen blankets, and beer increased substantially. The coal industry also maintained a stable output in spite of more holidays in this period, and fulfilled one-fourth of the annual target. The railway freight volume in this region increased by 1.9 percent over the same period of last year, and the output of electricity increased by 27.88 percent. In the whole period of the first quarter, electricity supply was not subject to any rations, and this provided a good basis for the steady development of industrial production.

All the region's localities and departments have seriously carried out the spirit of the regional economic work conference and the recent telephone conference and have paid attention to summing up the experience in directing industrial production and transportation in the period of the Sixth 5-Year Plan anddppreventing themselves from relaxing efforts. From the beginning of the first quarter, they tried hard to maintain a good situation in which there are both good economic results and an appropriate growth rate in industrial production and transportation. Meanwhile, responsible comrades of various regional economic departments led other cadres to inspect work and make investigations in some key enterprises in Yinchuan and Zhizuishan. They helped those enterprises solve such problems as lack of raw materials, working funds, markets for farm machines and fertilizer, thus ensuring the steady growth in industrial production and transportation. In March, the total industrial output in the region exceeded 200 million yuan for the first time. The electricity bureau, the metallurgical industrial company, the petrochemical company, the urban and rural construction department, the state farm administration, Shizuishan City, and Wuzhong City increased their industrial output value to differing extents in the first quarter.

The work of increasing exports and foreign exchange earnings has also made substantial progress. The policies for promoting the integration of industrial production with foreign trade and for giving incentives to the enterprises to increase exports have effectively aroused the initiative of the enterprises to develop export-oriented production. Both the quantity and variety of export goods have been increased. In the first quarter, the region's total export volume reached $6.98 million, an increase of 162 percent over the same period last year. Among other goods, the export of anthracite, rice, and maize increased substantially. Since the beginning of this year, localities, departments, and enterprises in this region have continued to concentrate their efforts on improving economic results, stopping business losses, and increasing profits. The heavy industrial department, Yinchuan City, and Guyuan prefecture have substantially reduced the losses incurred by their enterprises. The regional revenue in the first quarter increased by 19.6 percent over the same period of last year.

LEADERS INSPECT CHINA-MADE PLANES

OW160625 Beijing XINHUA Domestic Service in Chinese 1221 GMT 15 Apr 86

[Excerpts] Beijing, 15 Apr (XINHUA)--Nearly 50 members of the Central Advisory Commission inspected China-made planes at the Capital Airport today. They admired the major progress made in developing China's aeronautics industry and also made some suggestions for the further development of the industry.

Wang Shoudao, Wu Xiuquan, Chen Xilian, and Duan Junyi, members of the Standing Committee of the Central Advisory Commission, and other commission members carefully inspected five models of aircraft. They were the transport-5, transport-7, and transport-11, transport-8, and transport-12. After inquiring about the performance and manufacture of the aircraft, the advisors took to the sky in a transport-7 and transport-8.

On behalf of the Central Advisory Commission, Wu Xiuquan said: Today I am very pleased to see the different models of aircraft manufactured in China. The people of the entire country are concerned about the development of the aeronautics industry.

Wu Xiuquan pointed out. We should pool all our technical forces to tackle knotty problems in developing the aeronautics industry so as to enable China to manufacture many kinds of high-performance aircraft. While implementing the principle of giving priority to self-reliance, we should also bring in and apply advanced foreign technology.

INCREASED INVESTMENT IN CHEMICAL INDUSTRY

OW241946 Beijing XINHUA in English 1541 GMT 24 Apr 86

[Text] Beijing, 24 Apr (XINHUA)--China will invest more than 20 billion yuan in developing and upgrading its chmical industry in the coming five years.

The announcement was made here today by Qin Zhongda, chemical industry minister, at a national work conference on the chemical industry which opened here today.

Qiu said the figure represents an increase of 64.5 percent in state investment for his industry in the next five years over the previous five years.

China's chemical industry is to construct 100 large and medium-sized projects in the coming five years, including three soda ash factories each with an annual production capacity of 600,000 tons in Shandong, Hebei and Jiangsu provinces.

China will upgrade 64 projects, including the Sichuan chemical plant, Liaohe chemical fertilizer factory and Nanjing chemical industrial company.

Of 100 new projects, 66 large and medium-sized projects will be built and go into operation in the period between 1986 and 1990.

By 1990, the annual output of chemical fertilizer produced in China will hit 16.3 million tons as against 13.35 million tons last year; soda ash will increase 75 percent, reaching 3.5 million tons.

The industry will give priorities to three aspects:

-- compound fertilizer and chemical ores: building a number of key projects for production of compound fertilizer and urea while upgrading medium-sized chemical fertilizer factories;

-- semi-finished chemical products: building three soda ash factories, each with an annual capacity of 600,000 tons, expanding five alkali factories and upgrading a number of small enterprises;

-- fine chemical products: undertaking 72 new projects and reconstruction projects, expanding production of chemical pesticides, dyestuffs, coatings, catalytic agents, additives and other reagents.

Minister Qin said the chemical industry is facing heavy tasks and four severe challenges: the speed of development has slowed down in the past few years and can not keep pace with industry and agriculture; large energy consumption but short supply of energy; irrational structure of products and competition in the world market; backward facilities and technology in some enterprises.

LIAOWANG ON NEW TRENDS IN LIGHT INDUSTRIAL DEVELOPMENT

HK080727 Hong Kong LIAOWANG OVERSEAS EDITION in Chinese No 17, 28 Apr 86 pp 15-16

[Article by Hong Kong [3163 3163] and He Yanping [0149 4291 1627]: "New Trends of Development in China's Light Industry"]

[Excerpts] In a recent speech, Chinese Premier Zhao Ziyang pointed out: On the consumer goods market, efforts should be made to create a situation marked by supply slightly exceeding demand in order to gradually develop a buyer's market. This idea has inspired Chinese consumers and indicated the direction for future consumer goods production.

From Having Adequate Food and Clothing To Beijing Fairly Well-Off

Before 1980, China's consumer goods pattern still stressed meeting the basic needs of the people with low income and low consumption as regards their simplist daily life. Light industrial production lagged behind the people's needs and there was a serious imbalance among agriculture, light industry, and heavy industry. As commodities were in short supply, we could not but use all kinds of tickets or certificates to restrict supplies. During the Sixth 5-Year Plan period (1981-1985), the Chinese Government vigorously developed consumer goods production by implementing a "six-priority" policy toward light industry. After several years of hard efforts, the situation marked by supply falling short of demand has notably changed. According to statistics, the light industry, which in terms of commodity value provides more than one-third of the total consumer goods market value, supplied the market with commodites worth more than 480 billion yuan during the Sixth 5-Year Plan period. It can be said that the Sixth 5-Year Plan period saw the great expansion and development of light industry. It was the best period in the history of light industrial production.

It is on this basis that the program for Light Industrial Development in the Seventh 5-Year Plan period has been drawn up. It is aimed at adapting to the need to gradually enhance the quality of the people's lives and lay a good foundation for development in the next decade. The specific goal is that the gross value of light industrial production in 1990 is set at 231 billion yuan, an average annual increase of 8 percent. This means that in the next 5 years light industry should provide the consumer goods market with commodities worth more than 1,600 billion yuan.

With its 40-plus major trades, light industry turns out a rich variety of products. Food, clothing, and durable consumer goods are regarded as the three mainstays of light industry. The output value of the three major trades always accounts for more than 40 percent of the total value of light industrial output. They are the trades most closely related to millions upon millions of consumers.

The total output value of the food industry, the first mainstay of light industry, was 20 billion yuan last year, accounting for 7.8 percent of the total value of light industrial output, up 80 percent over 1980. By 1990 it will have reached 30.8-35.8 billion yuan.

Durable consumer goods have developed most rapidly in China in recent years. Household electrical appliances in particular have grown by leaps and bounds, almost out of nothing. In 1980 the volume of retail sales in durable consumer goods accounted for only 4.4 percent of the country's total volume of retail sales in consumer goods, which was a very small proportion. By 1985 the total output value of household electrical appliances alone reached 6 billion yuan, an increase of 414 percent over 1980. The output of washing machines increased by 35 times, refrigerators by 23 times, and electric fans by 2.7 times.

By 1990 the total output value of household electrical appliances will have reached 17 billion yuan, an increase of 183 percent over 1980. The annual output of refrigerators and washing machines will have reached 5 million and 8 million respectively.

In the Seventh 5-Year Plan period, on the basis of improving economic results, China's light industry will maintain a better than moderate growth rate and strive, by 1990, to improve the quality of 25 percent of its products to such a level as to rival the quality products abroad.

Quicken the Pace of Entering the International Market

Light industrial products are China's traditional export products. The export value of light industrial products has always accounted for some 20 percent of China's total export value over the years. In the Sixth 5-Year Plan period, by exporting light industrial products China earned $24.2 billion in foreign exchange. In the future, the focus of development of China's light industrial export commodities will be placed in the coastal areas and open cities. China will rely on these areas to achieve the changeover of light industry from an inward-oriented to an outward-oriented pattern.

The foreign exchange earnings of China's light industry will increase by 60 percent. 90 over 1985, an average annual increase of 9.8 percent. It is estimated that at that time there will be 15 categories of products whose annual foreign exchange earnings through export will exceed 100 million yuan.

In the Sixth 5-Year Plan period, China imported nearly $3 billion worth of light industrial technology and equipment. It has transformed the outdated enterprises, developed the rising industries, increased the number and variety of new products, and reduced the consumption of energy and raw materials. During the Seventh 5-Year Plan period, China's light industry will continuously do a good job in imports, particularly the imports of software and technology. The focus of construction will be on the production lines of beer, clothes processing, papermaking, canned food, drinks, glass bottling, and leather.

BUILDING MATERIALS INDUSTRY TO GROW THROUGH PRC-FOREIGN WORK

HK100512 Beijing CHINA DAILY in English 10 May 86 p 1

[By staff reporter Liu Dizhong]

[Text] China is expanding its economic and technological co-operation with foreign countries to develop the nation's building materials industry.

Efforts are also being made to seek new world markets for China's traditional building materials like marble, granite, graphite, talcum and quartz.

Negotiations are in full swing to import technology and equipment to improve production of cement, plate glass, high-quality ceramics, wall and roof materials, architectural decorations and fitting materials. Foreign partners are mainly from Italy, Federal Republic Germany, Britain, France, the United States and Japan.

China also plans to import technology and other facilities to upgrade its exploration for and processing of the country's abundant marble and granite resources, Lin Hanxiong, director of the State Administration of Building Material Industry, told CHINA DAILY.

Lin said more than $200 million was spent last year on importing technology and equipment, which would not only help modernize the nation's building materials industry, particularly the production of new-type materials, but also greatly reduce the nation's import of high-quality fitting and decoration materials.

Economic co-operation with foreign countries also includes allowing foreigners to explore for deposits of some non-metallic minerals such as granite, marble, mica, gypsum and talcum, Lin said.

Widespread capital construction and the building boom both in urban and rural areas are the incentives for the rapid development of the nation's building materials industry. Production of cement this year is expected to reach 145 million tons, an increase of 15 percent over last year, and the output of plate glass will be 60 million standard crates, a rise of 9 percent.

INDUSTRY

PLANS TO INCREASE PAPER, CARDBOARD PRODUCTION REPORTED

OW071358 Beijing XINHUA in English 1226 GMT 7 May 86

[Text] Beijing, 7 May (XINHUA)--China will increase its production of paper products and cardboard and lower the weight of newsprint paper over the next 15 years, according to today's PEOPLE'S DAILY.

Paper products for daily use, such as toilet paper, diapers, paper napkins, and paper curtains, will account for six percent of the country's total paper production by the year 1990, as compared with almost four percent in 1980, said the DAILY.

China plans to produce 3.8 million tons of package cardboard in 1990, which will account for about 40 percent of the country's paper and cardboard products. Only 23 percent of China's paper and cardboard production in 1980 was given to package cardboard.

However, even with the increase, the country's package cardboard production will still fail to meet the market demand of 4.3 million tons in the year 1990, said the DAILY.

Lack of timber is a major factor which results in the unsatisfactory production of package cardboard, it noted. To tackle the problem, the DAILY said the country should explore its rich resources of cotton.

China produced more than 12 million tons of cotton in 1985. It takes approximately two tons of cotton to make one ton of cardboard.

To boost its paper industry, China will perform technical retooling in its large or middle-sized paper mills and increase research on technology of making paper from grass, bamboo, and bagasse pulp, said the DAILY.

The country will also increase its production of offset printing and copper printing process paper, coated magazine paper, web paper, liquid paper containers, duplicating paper, and computer paper.

The per square-meter weight of the country's newsprint will go from the present 51 grams to 48 grams or lower. Other types of paper will also be lightened over the next decade or so, said the DAILY.

BRIEFS

INDUSTRIAL PRODUCTION IN CHONGQING--Industrial production in Chongqing City began to increase in April. Industrial output value for April increased by 3.6 percent over March. Due to shortage of power, capital, and raw materials, industrial production in the city decreased in the first quarter of this year. Since 10 April, the city CPC Committee and government have held three meetings on industrial production and adopted a series of urgent measures. Leaders at all levels in industrial and communications departments have gone to the grassroots to perform their official duties there. They have instituted the 24 hour duty system. All economic departments have also actively created conditions to boost industrial production. [Excerpt] [Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 6 May 86 HK] /12624

IRON, STEEL OUTPUT BOOST--Beijing, 4 Apr (XINHUA)--China produced 12.36 million tons of steel and 11.62 million tons of pig iron in the first 3 months of this year, the Metallurgical Industry Ministry announced today. Compared with the same period of last year, the steel output was up by 9.8 percent and iron, by 11.9 percent. The output of heavy and light rails, medium-thickness steel sheets and fine-quality shaped steel, which are badly needed in China, registered a 10 percent increase over the same period in 1985. The Ministry attributed the increase to the renovation of old iron and steel mills and the startup of the Baoshan Iron and Steel Corporation near Shanghai. SHANGHAI'S JIANG ZEMIN ATTENDS HOUSING MEETING

OW101353 Shanghai City Service in Mandarin 0000 GMT 10 May 86

[Excerpts] Shanghai has laid down the goal for housing construction in the Seventh 5-Year Plan. It will strive for a per capita housing space of 6 square meters for the city proper.

The municipal government held a meeting on housing construction on 9 May to lay down the objectives of housing construction for this year and during the Seventh 5-Year Plan.

Mayor Jiang Zemin and Vice Mayor Ni Tianzeng attended and addressed the meeting.

Shanghai made fairly rapid progress in housing construction during the Sixth 5-Year Plan. However, housing shortage is still a prominent problem. Statistics show that Shanghai's per capita housing space is less than 3 square meters, and that there are more than 500,000 families with housing difficulties, where one room is shared by three generation or two couples.

The meeting proposed to complete and put to use 4.6 million square meters of houses with electricity this year. It laid emphasis on the construction of utility, power supply, and environmental projects for the residential areas.

Furthermore, the meeting disclosed that the major objectives in housing construction in Shanghai during the Seventh 5-Year Plan had been laid down, including the construction of 22 million square meters of new houses, equivalent to housing space for about 425,000 families. This will basically solve the problem of families currently experiencing special housing difficulties.

HUANG HE DIVERSION PROJECT TO SOLVE QINGDAO WATER PROBLEMS

HK091356 Hong Kong LIAOWANG OVERSEAS EDITION No 17, 28 Apr 86 p 18

[Article by Xiao Taifeng [5618 3141 1496] and Zhu Wenzhi [2612 2429 1807]: "Leading Water from the Huang He to Qingdao -- Another Large-scale Water Conservation Project in China"]

[Excerpts] After the project of diverting water from the Luan He to Tianjin was completed, another large-scale trans-river basin water diversion project in China -- diverting water from the Huang He to Qingdao -- was started in Shandong Province on 15 April. By the end of the 1980's, water from the Huang He, once the silt has settled, will flow to Qingdao City through a new canal, thus the long-standing problem of water shortage in the city will be basically solved.

Diverting Water from the Huang He to Qingdao

In the wake of constant economic growth and the implementation of the policy of opening up to the outside world, there is an evergrowing need for water in Qingdao City. In order to ensure that Qingdao's gross industrial output value will quadruple by 2000 and to turn Qingdao into a modern tourist and port city which, with light industry and the textile industry as its main production sectors, will have a prosperous economy, a beautiful environment, and a high standard of scientific and technological development, culture, and education, Shandong Province put forth on January 1982 a tentative trans-river basin diversion project aimed at drawing water from the Huang He to Qingdao.

Is it possible to draw water from the Huang He in Northern Shandong to Qingdao City on the southern side of the Shandong Peninsula? After thorough investigations, on-the-spot prospecting, and repeated comparisons and feasibility studies, water conservation experts from Shandong and other provinces unanimously agreed that this is a way to solve once and for all the problem of Qingdao's water supply as a reliable source of water is available and the whole plan is feasible and economically rational. During an inspection of the Huang He by Wan Li, Hu Qili, Li Peng, and other leaders from the CPC Central Committee and the State Council, it was decided that the open canal method would be used in the project of diverting water from the Huang He to Qingdao. On 18 October 1985, the State Council officially ratified this project, to be run by Shandong Province.

Sun Yirang, chief engineer in charge of the construction of the project, told us: The project of diverting water from the Huang He to Qingdao will start from the Dayuzhang water gate at Boxing County in Northern Shandong, the canal will pass through 10 counties and districts under the jurisdiction of Huidong prefecture, Dongying, Weifang, and Qingdao cities, cross over 36 large and small rivers including the Xiaoqing He, the Mi He, the Bailand He, the Wei He, the Jiaolai He, and the Dagu He, and then flow into Jihongtan Reservoir, which has a capacity of 140 million cubic meters, newly built on the southern side of the Qingdao-Jinan railway. After that, water will be drawn to Hedong Waterworks in Qingdao City through water supply pipelines. The total length of the water diversion system will be about 290 kilometers. It will contain more than 330 pumping stations, aqueducts, bridges, waterworks, and culvert gates. The volume of excavation and fill involved in the whole project will total 60 million cubic meters and the stone laying work will total 900,000 cubic meters. With an investment of 800 million yuan, the whole project will be basically completed in 3 years and rounded off in 4 years.

The project of diverting water from the Huang He to Qingdao will be the greatest water conservation and urban construction project that Shandong Province has initiated in the past 30-odd years since the founding of the PRC. Given a 95-percent water supply rate, the project, after completion, will supply Qingdao with 109.5 million cubic meters of water a year, or 300,000 tons a day. So, a fundamental turn for the better in water supply will be effected in Qingdao City by the year 2000. In light of the importance of the role that water plays in industrial production, the project will bring Qingdao an additional income of more than 180 million yuan a year, and the city's per-capita consumption of water will be raised from the current level of less than 50 liters a day to over 160 liters a day by 2000.

Looking ahead, Chief Engineer Sun Yirang said: In the near future, Shandong will launch a project to divert water from the south to the north, that is, to divert water from the Chang Jiang to Dongping Lake; and another project to divert water from the western part of the province to its eastern part, that is, to divert water from Dongping Lake to Shengli Oil Field bordering on the Bo Hai. These projects, linked with the project of diverting water from the Huang He to Qingdao, will form an artery for water supply stretching across the central part of Shandong Province which will make the unified control and use of the waters of the Chang Jiang, the Huang He, and local sources possible. This will be of inestimable significance to the long-term development of Shandong Province.

DALIAN PORT UNDER LARGE-SCALE CONSTRUCTION

OW120559 Beijing XINHUA in English 0540 GMT 12 May 86

[Text] Dalian, 12 May (XINHUA)--Twenty-two projects are under construciton to upgrade the freight-handling capacity of Dalian, the biggest port in north China, according to the city authorities.

The annual handling capacity of the port will increase from 43 million tons in 1985 to 70 million tons by 1990.

The port handles import and export goods for the whole of northeast China, including Liaoning, Jilin and Heilongjiang provinces and the eastern part of the inner Mongolia autonomous region.

Since the state decided to open Dalian to the outside world in 1984, imports and exports in this region have risen so rapidly that port congestion has become a serious problem.

The projects under construction include:

-- the Heshangdao coal harbor, with an annual capacity of five million tons. Some 30 km from the city proper, the harbor is scheduled to go into operation by 1988;

-- a berth to accommodate 200,000 dwt oil tankers;

-- the Dayao bay harbor. With ten berths to accommodate ships under 100,000 dwt, the harbor will have an annual capacity of 5.7 million tons after its completion in 1994;

In addition, 19 technological transformation projects are underway.

The local government has invested in the transformation of a coal dock into one to handle corn, with an annual capacity of 1.5 million tons. The project will be completed by the end of this year.

Meanwhile, the state has imported 40 diesel locomotives from the United States to accelerate transportation of imports and exports from the port to other parts of China.

The port is also streamlining the loading and unloading equipment.

At the same time, five medium-sized and small ports are being built along the 2,000 km of coastal line of Liaoning peninsula to divert imports and exports from Dalian and so ease the congestion in that port.

The Dalian Marine Safety Control Bureau under the Ministry of Communications was set up recently, to facilitate the operations of foreign ships.

BEIJING MAYOR COMMENTS ON PRESERVING CITY'S CHARACTER

OW131201 Beijing XINHUA in English 1146 GMT 13 May 86

[Text] Beijing, 13 May (XINHUA)--From now on, buildings constructed in Beijing should keep in harmony with the ancient edifice, mayor Chen Xitong said here today.

Only two or three-story buildings not exceeding nine meters in height will be allowed within 250 meters of the walls of the imperial palace, he specified.

For areas nearby, the maximum height of buildings will be 18 meters, he added.

In addition to restricting the height of new buildings, the mayor called for keeping the flavor of the ancient capital especially in areas round the forbidden city.

Beijing was China's capital for more than 800 years, from the Yuan (1271-1368) through to the Qing dynasty (1644-1911).

He made these proposals in a report on Beijing's social and economic development during the Seventh Five-Year Plan period (1986-1990) to the Fifth Session of the Eighth Municipal People's Congress which opened in the great hall of the people.

Still more effective protection of cultural relics and sites of historic interest was another proposal. So far, Beijing has designated 189 such relics and sites under state or municipal protection.

Beijing should also strive to integrate the national and modern building styles, he said, under the principle of building Beijing into a modern city while preserving its characteristics as an ancient capital.

The new buildings should be not only beautiful but practical and economical, he added.

Unauthorized construction of buildings will be banned, such as grabbing every bit of space to erect buildings among old houses.

Over the past three decades, he noted, the city area, in a chess-board pattern, has expanded greatly, with the old north-south axis extending to 15.3 km from 7.8 km, while a new east-west axis has been formed with the widening and extending of east and west Changan Boulevard.

The old city wall has been demolished and ring roads and underpasses constructed.

BRIEFS

CHINA TO COMPLETE PROJECTS--Beijing, 25 Apr (XINHUA)--China is to complete 78 major capital construction projects this year, according to the State Planning Commission today. This will add an extra 15 million tons of coal, 84 million bbl of crude oil, 3.8 million tons of steel and two million tons of cement a year. It will also add a generating capacity of 4.8 million kw to the country's power industry and increase the cargo handling capacity of ports by 24 million tons. New railway lines totaling 1,000 km will be opened this year, with some 300 km of lines electrified. The projects also cover the textile, electronics, automobile, machine-building, medicine, water conservancy, and light and defense industries. [Text] [Beijing XINHUA in English 1050 GMT 25 Apr 86 OW] /12624

TIANJIN MAYOR DISCUSSES RECONSTRUCTION--Tianjin, 26 Apr (XINHUA)--Tianjin has more than repaired the damages caused by a 7.8-magnitude earthquake in 1976, through reconstruction over the past decade. Speaking at a municipal People's Congress session now in progress, Mayor Li Ruihuan said that over the past decade, Tianjin has built houses with a floor space of more than 22 million square meters. The earthquake, which occurred in nearby Tanshan on July 28, 1976, damaged more than 16 million square meters of Tianjin's housing, he said. A dozen new residential quarters, with one million households, have been completed. Meanwhile, the city has repaired or reinforced 14 million square meters of housing. In the course of reconstruction, Tianjin widened 30 streets and built two ring roads with a total length of 35 km, as well as a dozen overpasses. From now on, the mayor said, municipal construction will be in line with an overall plan that envisages Tianjin as an industrial economic center and an international port. FOREIGN TRADE AND INVESTMENT

JIANGXI USED MORE FOREIGN CAPITAL IN 1985

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 20 Dec 85 p 3

[Article by reporter Chen Yao [7115 3852]: "Jiangxi Quickens Tempo of Using Foreign Capital--European, American, and Southeast Asian Investments Account for 80 Percent and Priority Is Given to the Development of Energy, Communications, Posts, Telecommunications, and Tourism"]

[Text] According to the Jiangxi Provincial Government, Jiangxi in 1985 absorbed $1 billion of foreign capital for the funding of 165 projects, an 18.7-fold increase over 1984. Among these projects, 16 have already been completed and put into production.

A government official of this province said it is estimated that after they are completed and put into production, the 118 imported items of technology and equipment which cost over $56 million will produce 1 billion yuan of output value annually.

This official said that one of the characteristics in Jiangxi's efforts to quicken its tempo of using foreign capital in 1985 is strengthening energy construction. After the Jiangxi Power Network was merged into the Central China Power Network in the second half of 1983, four thermal power generator sets with a total capacity of 500,000 KW in Jiujiang and Guixi areas were put into operation, increasing the total installed capacity of Jiangxi Province to 2.15 million KW or so.

In the meantime, the government encouraged all departments to strive to rejuvenate communications businesses. Two new air routes--one from Lushan to Xian via Huiyang and another from Wuhan to Fuzhou via Nanchang--were open and flights from Nanchang to Beijing and Guangzhou were increased in 1985. Since its offical operation in June 1985, the Wangan Railway has reduced pressure on the two trunk lines of the Zhegan and Yingxia railways.

A number of guest houses and hotels were built and expanded in major industrial and tourist cities such as Nanchang, Jingdezhen, and Jiujiang.

In addition, efforts are being stepped up to replace communications, posts, and telecommunications facilities. A set of 10,000 program-controlled telephones are now being installed in the provincial capital--Nanchang--and will be put into operation in 1986 according to the plan.

This official also said that in the past most investors came from the Hong Kong and Macao area. In 1985, foreign businessmen came one after another from European, American, and Southeast Asian countries. Their investments have increased to about 80 percent.

While absorbing foreign capital, Jiangxi also established joint ventures in Japan, the Federal Republic of Germany, and Hong Kong. It also signed letters of intent for local investment in South Dakota and New York of the United States.

Located in the hinterland to the south of the Chang Jiang, Jiangxi Province is rich in natural resources. In opening to the outside, it has emphasized the need to choose projects that yield great economic results and quick foreign exchange earnings while building export commodity bases and developing export trade.

TRADE BETWEEN MAINLAND CHINA, HONG KONG INCREASES

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 7 Jan 86 p 5

[Article by staff reporters: "Mainland China Strengthens Economic Activities in Hong Kong--Cooperation Projects and the Transactions of Export Commodities Broke Records in 1985"]

[Text] Last year was a year in which the most frequent economic contacts were made between mainland China and Hong Kong. Various provinces and municipalities repeatedly sponsored various economic talks and fairs and set up trade organizations one after another in Hong Kong. At the same time, Hong Kong-based Chinese organizations also formed corporations. These activities have accelerated economic cooperation between the two areas.

Last year, a total of 20 provinces and municipalities of mainland China sponsored economic and technological cooperation talks and export commodity fairs in Hong Kong with great successes. According to incomplete statistics, various agreements and letters of intent signed last year on economic and technological cooperation involve over $3 billion and the transactions of export commities amounted to over $500 million, breaking historical records. Of all provinces, Guangdong had the richest results. It signed over 300 contracts worth more than $1.1 billion and exported nearly $200 million of commodities. Shanxi, Hunan, Yunnan, and Guangxi provinces and autonomous regions came to hold talks in Hong Kong for the first time and even the remote Nei Monggol Autonomous Region also brought to Hong Kong 54 economic and technological cooperation projects.

Last year, mainland China's economic activities in Hong Kong mainly consisted of import and export trade, technological and financial cooperation, personnel training, and the study of management experience.

Last year was a year in which the greatest number of trade organizations were established in Hong Kong by various provinces and municipalities of mainland China. Jiangsu, Guangxi, Qinghai, Henan, Hunan, Shaanxi, Guizhou, and Nei Monggol provinces and autonomous regions and Fuzhou, Beihai, and Ningbo cities established new organizations in Hong Kong. Last year alone, 10 municipalities and cities of Guangdong Province established companies in Hong Kong.

Many Hong Kong-based Chinese organizations have concentrated on diversified business, increased investment in Hong Kong, and formed corporations. Last year, the China Merchants Corp., the China Travel Service, the Yuehai, Shenye, and Huamin companies formed corporations one after another in Hong Kong.

The China Merchants Corp. is one of the Chinese organizations of the longest history and greatest assets in Hong Kong. It has now developed into a large international corporation with nearly 200 subordinate companies, subsidiaries, and jointly-managed companies. The China Travel Service has been in Hong Kong for several decades. It has not only built new buildings and bought two hotels in Hong Kong but also prepared to build an "Overseas Chinese Town" in Shenzhen and vigorously engaged in many businesses, including domestic and foreign travel services, consulting service, industry, passenger and freight transport, and trade. In addition, the China Resources Holding Co.--the largest trade organization of mainland China in Hong Kong, which was incorporated in 1983--now owns over 50 subordinate companies of sole proprietorship and has developed its business scope from trade to industry, navigation, storage, and general merchandise. Last year the China Resources Holding Co. invested HK $250 million to develop the Changshawan cargo wharf and warehouse to meet the increasing need for freight transport between mainland China and Hong Kong. The Everbright Corp., which was incorporated in 1984 and now owns 11 subsidiaries, has imported over $500 million of technology and equipment for mainland China in the past 2 years. Chinese organizations which are active in all sectors of Hong Kong's economy have become an important force in accelerating economic exchange and cooperation between mainland China and Hong Kong.

HEILONGJIANG PLANTS GIVEN GREATER AUTONOMY IN FOREIGN TRADE

SK111030 Harbin Heilongjiang Provincial Service in Mandarin 2100 GMT 10 May 86

[Text] The Harbin Electrical Machinery Plant, the Jiamusi Electrical Machinery Plant, and five other machinery and electrical product plants of our province have been designated as the state's first group of enterprises entitled to greater autonomy in foreign trade.

Machinery and electrical product enterprises of our province possess fairly substantial strength, and many of our machinery and electrical products have entered the international market. The successful operation of the large 210,000-kilowatt thermal power-generating equipment exported to Pakistan for the first time through bidding by the Harbin Power Station Equipment company has shown that the large power-generating equipment designed, manufactured, and installed by our province has a very strong competitive edge in the world.

In order to arouse the initiative of enterprises in earning foreign exchange through exports, and gradually establish a network for the production of export machinery and electrical products, our province's Harbin Electrical Machinery Plant, Jiamusi Electrical Machinery Plant, Qiqihar No. 1 Heavy Machinery Plant, Harbin Power Station Equipment Company, Harbin Measuring and Cutting Tools Plant, Harbin Bearings Plant, and Harbin (Jiancheng) Machinery Plant were designated as our country's first group of machinery and electrical product enterprises entitled to greater autonomy in foreign trade after being examined and approved by relevant departments of the State Council. These enterprises with great autonomy enjoy the state's preferential policies in the import of equipment and raw materials, and in carrying out technical transformation. At the same time, the state has also set forth specific demands on these enterprises.

GOVERNOR ATTENDS JIANGXI ECONOMIC, TRADE MEETING

OW070806 Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 3 Mar 86

[Excerpts] Jiangxi Province recently held a provincial economic and trade meeting in Xinyu City. The meeting pointed out: It is necessary to mobilize governments at all levels; arouse enthusiasm in all quarters; and for both the leadership and the rank and file to make joint efforts to increase export trade, earn more foreign exchange, and improve Jiangxi's economic work and trade as soon as possible. This should be achieved in the same way in which we support the construction of the old revolutionary base areas and lengthen the two short legs [as heard].

The meeting pointed out: In 1965 Jiangxi's export trade growth was slightly higher than the national average. However, it still lagged far behind some other provinces, and was incommensurate to Jiangxi's abundant natural resources and total industrial and agricultural output value.

Ni Xiance, deputy secretary of the Jiangxi Provincial CPC Committee and governor of Jiangxi, attended and addressed the meeting; as did Jiang Zhuping, member of the Standing Committee of the provincial Party Committee and vice governor of Jiangxi.

HUNAN GOVERNOR MEETS VISITING HONG KONG DELEGATION

HK141308 Changsha Hunan Provincial Service in Mandarin 1100 GMT 9 Apr 86

[Text] Led by Mr (Ma Szu-ming), president of the Hong Kong Hutchison Whampoa Group, and (Huang Ni-hung), acting chairman of the board of directors of Hong Kong (Zhongxin) Investment Company, Limited, the hometown-visiting delegation of Hong Kong business circles, composed of 11 persons, arrived in Changsha this morning. The delegation will pay 4-day visits to our province and will hold talks on economic cooperation.

At the invitation of the provincial government, this delegation of Hong Kong business circles has come to visit our province. The Hutchison Whampoa Group is one of the financial groups in Hong Kong with the greatest actual strength. Its gross capital exceeds $1 billion.

In January of this year, supported by Mr K.S. Li, chairman of the board of directors of the Hutchison Whampoa Group and a famous Chinese entrepreneur in Hong Kong, the Hutchison Whampoa Group and the Hunan International Economic Development Company set up (Zhongxin) Investment Company, Limited, with joint capital. Thus, the Hutchison Whampoa Group has established connections with our province.

After the delegation arrived in Changsha this morning, Governor Xiong Qingquan met all members of the hometown-visiting delegation and held cordial talks with them. Governor Xiong introduced our province's situation in resources and economic construction and hoped to import capital and technology to speed up economic construction.

Mr (Ma Szu-ming) and others were greatly interested in our province's abundant resources and in the big market and declared that they would carry out extensive and long-term economic cooperation with our province so that the connection already established can become still closer.

HEILONGJIANG'S EFFORTS AT ECONOMIC MODERNIZATION SKETCHED

Beijing LIAOWANG [OUTLOOK] in Chinese No 48, 2 Dec 85 p 27

[Article by Kang Weizhong [1660 0251 0022] and Wang Baoxin [3769 1405 2946]: "Open the Main Gate and Advance into the World---An On-the-Spot Report on Heilongjiang Province's Work in Opening to the Outside World"]

[Text] On 25 and 26 August, Heilongjiang Province held talks on economic and technical cooperation and on export goods at which it received more than 800 foreign guests, the largest number of people to attend similar talks in the country this year. Export trade transactions concluded during the talks amounted to $342 million, and 62 joint venture, cooperation, and compensation trade agreements and agreements for the importation of technology and equipment were signed, totaling an investment of more than 260 million yuan. This included the signing of 10 contracts for economic cooperation and compensation trade and 50 contracts for the importation of technology and equipment. In addition, 77 agreements and declarations of intent were signed for economic and technical cooperation and the importation of technology and equipment. During 1985, the province concluded a total of 176 agreements for the importation of technology and equipment for joint ventures, cooperation, and compensation trade for a total investment of more than 635 million yuan and it concluded a foreign exchange volume of more than $135 million. Use of foreign capital more than doubled over 1984 and was greater than the total amount of foreign capital used during the previous 5 years.

Following the 3d Plenum of the 11th Party Central Committee, in order to translate advantages in natural resources into production advantages and economic advantages, the Heilongjiang Provincial CPC Committee and the provincial government formulated correct strategic objectives for opening to the outside world and enlivening the domestic economy. The Provincial CPC Committee and provincial government repeatedly discussed and studied these matters, concluding that opening to the outside world was a road that had to be taken for vigorous development of Heilongjiang's economy. This was because most of the equipment and technology required for energizing key enterprises for development of the province's national economy, and particularly the equipment and technology in the the 20 key projects built during the First 5-Year Plan, is outmoded. Furthermore, most of these enterprises were for the preliminary processing of raw materials and the province had large amounts of other natural resources urgently in need of development. Thus, the importation of the technology, capital, and all the advanced things the province needed through opening up to the outside world had become a key issue in the vigorous development of Heilongjiang that had to be taken firmly in hand, actively and with initiative.

How could Heilongjiang Province, which has always been regarded as the "great northern waste, open its main gate? To use the words of the provincial governor, Hou Jie [0186 2212], this meant "making the most of advantages, taking the initiative in moving out, making friends on a wide scale, and strengthening ties." Principal leading cadres in the Heilongjiang CPC Committee and government have visited some countries and regions in Europe, North America, and Southeast Asia, have had wideranging contacts with governments, economic circles, and persons in industry, have increased their understanding, and have sought to increase channels, levels, and forms of economic and technical cooperation. In order to provide foreign traders with an understanding of Heilongjiang, in 1984 Provincial Governor Hou Jie held a press conference in Hong Kong that was attended by Chinese and foreign correspondents, which provided a systematic briefing on Heilongjiang. Early in 1985, he held a news release conference in the capital at which provincial government persons in charge again announced Heilongjiang Province's desire to cooperate with foreign countries on 110 projects, and that the Heilongjiang Provincial Government had instituted 12 preferential policies concerning taxes, markets, prices, foreign exchange, and import and export controls for investments in various kinds of enterprises in the province by compatriots from Hong Kong, Macao, and Taiwan, by overseas Chinese abroad, and by foreign traders.

Heilongjiang Province has set up in Hong Kong the Port Consultation and Development Company Limited, the Longfeng Company Limited, and the Longguang Enterprise Company Limited, and it jointly operates with local notables the Benha [phonetic] Company Limited in Zaire. In the United States, it operates a joint venture with overseas Chinese in Guam called the Pacific Group Development Company, and in New York it has established the Heilongjiang Commercial Department as part of the Chinese Trade Center. It maintains similar organizations in Hamburg and in Madagascar. It has used these "windows" for wide-ranging development of foreign contacts, causing a "Heilongjiang craze" in some countries and regions. During the past 1 or 2 years, nearly 30,000 compatriots from Hong Kong and Macao, overseas Chinese from abroad, and foreigners have annually visited Heilongjiang for economic and technical discussions, for sightseeing, and for tourism. Inside China, Heilongjiang Province has established diverse economic and technical cooperative relationships with more than 300 cities in 28 provinces, municipalities, and autonomous regions.

Once numerous economic and technical cooperation projects have gone into production, they have effectively improved the technical quality of enterprises, improved product quality, increased competitiveness and developed staying power. For example, the Haerbin Electric Cable Plant introduced new, internationally advanced oxygen-free copper rod technology to solve the problem of the not very high quality of its electric cables. As a result, the enterprise's technological level and the quality of its products reached advanced world standards, and economic results rose markedly. After the

Haerbin Linen Textile Plant imported advanced linen weaving equipment, product quality rose, colors and styles increased, and the increase in output value during the same year that the equipment went into production amounted to 23 million yuan.

When General Secretary Hu Yaobang visited Heilongjiang on a fact-finding mission in August 1984, he gave instructions on Heilongjiang's further opening of its main gate to the outside world. The provincial CPC Committee and the provincial government reviewed and summarized experiences for the several previous years in opening to the outside world, positively made adjustments to the open door structure, opened up the frontier ports on the Hei He and the Suifen He, and developed water, land, and air transportation avenues between the ports and the hinterland. As a result, this inland province gradually turned into a port province. Great increase also took place in the province's small volume of trade with the Soviet Union, this year's export of 330,000 tons of soybeans to the USSR having been completed ahead of schedule.

The provincial CPC Committee and the provincial government proposed 10 additional specific actions for further implementation of Central Committee directives and for widespread development of economic and technical cooperation with the outside world and for preparing the wherewithal for an economic takeoff. These actions included further institution of preferential policies for opening to the outside world; establishment of direct economic channels to foreign countries; emphasizing strengths and avoiding weaknesses in the launching of economic and technical cooperation with foreign countries; encouraging enterprises to expand their exports to produce foreign exchange; drawing up near-term and intermediate-term economic and technical cooperation plans; launching of imports from outside and contacts inside to promote inter-province economic and technical cooperation; acceleration of the training in groups and over a period of time of cadres for work in the foreign economic field; increased building of an economic and technical information network; launching of economic diplomacy inside and outside China; and establishment of a centralized economic and technical cooperation organization. All this work is presently in train.

Heilongjiang Provincial Governor Comrade Hou Jie believes that though Heilongjiang Province has scored achievements in opening to the outside world in a short period of time and has explored some experiences, nevertheless it still has to put a lot of effort into economic and technical cooperation with the outside world and it has to link these efforts to the national economic development strategy. It has to place major emphasis on the training of a corps of economic cadres, further widen the sphere of cooperation, and render good performance in all-around planning and overall deployments so that the vigorous growth of Heilongjiang's economy will see a new takeoff.

OPPOSITION EXPRESSED TO AMERICAN TEXTILE RESTRICTIONS

Beijing LIAOWANG [OUTLOOK] in Chinese No 48, 2 Dec 85 pp 31-32

[Article by Li Zongyang [2621 1350 2554]: "American Bill That Seriously Damages the Interests of Developing Countries"]

[Text] On 13 November, the United States Senate passed a bill that places harsh restrictions on the importation of textiles and ready-made clothing. This bill and the same kind of bill passed on 10 October by the House of Representatives will seriously damage exports by developing countries.

Acting in the name of protecting the United States textile industry, the two houses of Congress set out unilaterally to scrap the international obligations the United States assumed within the purview of the General Agreement on Trade and Tariffs [GATT] without regard for bilateral textile product trade accords concluded with more than 30 trading partners, tremendously reducing or freezing textile import quotas. According to the provisions of the harsh Jenkins bill, 1985 exports to the United States of textiles and ready-made clothing by 11 countries and regions in Asia and Brazil in Latin America are to be reduced by an average 35 percent. Exports from Indonesia, Thailand,and the Philippines will be cut by 81 percent, 64 percent, and 21 percent respectively. China's exports to the United States of textiles and ready-made clothing are also to be slashed 56 percent. As a result of this action, our deficit of trade to the United States will increase by $500 million. According to the provisions of the bill passed by the Senate, even though China's exports of textiles to the United States will not reach the increased quotas set by the "Multi-Fiber Arrangement" [MFA], they will violate the clauses pertaining to consultation contained in the Sino-American bilateral textile trade agreement. All kinds of textiles not currently subject to import regulations will be made a part of the unilateral restrictions.

Textiles and ready-made clothing are the main export items and sources of foreign exchange earnings for very many developing countries and regions. It has been estimated that as a result of the American important restrictions these countries will sustain a decline in foreign exchange amounting to $3.5 billion annually, and large numbers of workers in these countries will lose their jobs. The All Pakistan Textile Plant Association is apprehensive that the American bill restricting textile imports "might mean disaster for us." In Indonesia, a 3.5 million member textile trade union recently pointed out indignantly that this American bill "is a departure from America's own free trade principles."

Ever since the United States became the most powerful country in the capitalist world, it has consistently supported so-called "free trade for a fairly long period of time." However, as the American Dupont Company's director, Heckert said recently, this was matter that took place in a situation in which the "United States controlled world exports." Currently more than 300 proposals for the protection of individual industries or to attack individual exporting countries have piled up in the United States Congress awaiting decisions. The bill to restrict textile imports is the "spearhead" in this surge of trade protectionism. If these proposals, which amount to "buy American" become laws that are put into effect, then the principle of "fair free trade" will obviously no longer be utterable.

In reality, as a result of the MFA passed in 1973 and the standards based on this accord that the United States bilaterally concluded in several score agreements with textile exporting developing countries, the United States already severely restricted imports of various textile products and clothing. According to officially announced figures, American imports of textiles and ready made clothing declined 2.1 percent between January and August 1985 as compared with the same period during the previous year. During July and August, the decline was 13.3 and 7.2 percent respectively over the same period during the previous year. During the first 8 months of 1985, American imports from China of textiles and ready-made clothing were 20.6 percent less than during the same period in 1984.

China is a relatively new textile trading partner of the United States. China's exports of textiles to the United States are by no means a very large proportion of America's total imports, but textiles are a substantial proportion of China's exports to the United States. According to published American materials, China's exports of textiles and ready-made clothing to the United States amount to 42.32 percent of its total exports to the United States. Import restrictions on export products of such a large magnitude will doubtlessly block entry into the American market of Chinese goods, and thus must block healthy development of Sino-American trade relations. In May 1985, the Chinese government solemnly pointed out that inasmuch as China has run a trade deficit for a long period of time in its trade with the United States, American acceptance of goods shipped to America from China in order to develop bilateral trade has been of particular significance. The bill limiting imports of textiles and ready-made clothing passed by the two houses of Congress has clearly not seriously considered the legitimate interests of China.

Looked at in another way, American limitations on imports of Chinese textiles and ready-made clothing will seriously affect America's own exports even in the absence of legitimate retaliation. Revision of foreign aid bill number 327 approved in June 1985 by the United States Senate Foreign Relations Committee pointed out that inasmuch as the People's Republic of China is the world's largest potential market, Congress feels that exports should be increased to insure greater entry into the increasingly developing China market. But if Chinese exports to the United States of textiles and ready-made clothing are to be harshly limited, China's adverse balance of trade is to increase and foreign exchange to decrease, how will China be able to import more American products?

The content of the bill from the two houses of Congress limiting imports of textiles and ready-made clothing contravenes both the bilateral trade agreement between China and the United States and the MFA. Moreover, such a bill that disregards the development of trade relations between one country and another and that places the blame on its trading partners for its labor problems and adverse balance of payments that result from internal imbalances in the American economy is also extremely unjust. Consequently, governments, businesses, and the masses of workers in numerous textile exporting countries and regions such as the Philippines, Indonesia, Thailand, and Hong Kong have used various methods to express their intense dissatisfaction. It should be particularly noted that for the United States to institute harsh limitations on imports of textiles would not be consistent with the provisions of article 301 of the trade law of the United States itself. According to that article, the president of the United States has authority to fix import quotas only to help exporters who have been limited by foreign trade barriers. In point of fact, the difficulties in which the American textile industry finds itself are not the result of foreign limitations on its exports. Therefore, it is unreasonable for the United States to adopt restrictive measures unilaterally.

Reportedly President Reagan will veto the bill limiting textile imports, and at the present time the number of supporters of the bill to restrict textile imports in both houses of Congress is insufficient to override the president's veto. However, American government officials privately acknowledge that even were Reagan to veto the bill, the fact that such protectionist legislation had been passed by Congress could be used as a bargaining chip for warning America's trading partners. If this is truly the case, such a political game should not be played.

Today many members of government and the public express apprehensions lest protectionist legislation limiting textile imports not only place obstacles in the way of the development of trade between one country and another and impose serious hardships on the economy and society of developing countries, but also adversely affects the export of billions of dollars' worth of American agricultural products, forcing consumers in the country to spend $14 billion each year as a result of price inflation, creating widespread employment among retail employees, longshoremen, and transportation workers, and reducing American government revenues from tariffs by $2.5 billion.

Development of trade relations between the United States and China hold broad prospects. The amount of bilateral trade between China and the United States will continue to grow this year. Therefore, so long as both sides have the desire to continue to promote healthy development of trade relationships, no new barriers can be permitted to be erected on the road ahead.

BRIEFS

JILIN FIRST-QUARTER EXPORTS--In the first quarter this year, Jilin Province exported commodities worth $120.14 million, accounting for 27.17 percent of the annual export plan, a 176 percent increase over the figure of the corresponding 1985 period, and equal to the gross export volume of 1981. By the end of March, the province exported 750,000 tons of corn, accounting for 26.8 percent of the annual export plan, and overfulfilled its quarter Gaoliang export plan by 50 percent. HEILONGJIANG DEVELOPS BORDER TRADE--Since the border trade with the far east areas of the Soviet Union was restored in 1982, our province's export and import volume has reached more than 100 million yuan. The reasonable structure of imported or exported commodities has formed the relationship in which the province and the Soviet areas help supply each other's needs. The province's imported commodities chiefly are timber, cement, glass, fertilizer, (soda ash), refrigerators, vacuum cleaners, and meat mincers. The province's exported commodities chiefly are soybeans, canned meat, fruits, shelled peanuts, garments, knitted and textile goods, vacuum bottles, and bristle brushes. Since 1985, our province has also conducted the pilot work for exchanging commodities with Poland and Czechoslovakia through these Soviet areas. PRC SATELLITE STATIONS--According to ZHONGGUO DIANZI BAO [CHINA ELECTRONICS JOURNAL], after being displayed at the Asian and Pacific Fair in Beijing in 1985, the 6-meter satellite TV ground station, which was produced by the No 39 Research Institute of the Ministry of Electronics Industry, was chosen by the China Council for the Promotion of International Trade as an exhibit of the International Fair to be held in 1986 in Moscow. At the Asian and Pacific Fair, 650,000 yuan of deals were made on the 6-meter satellite TV ground stations of the No 39 Research Institute, accounting for almost 50 percent of the total transactions of the electronic exhibition hall. On the opening day of the Asian and Pacific Fair, the commercial councilor of the U.S. Council in China expressed his intention to buy the 6-meter station immediately after he watched U.S. and Australian TV programs received by the 6-meter station via No 14 international communications satellite, which is above the Pacific. Singapore, Canada, Austrialia, Indonesia, and India are all very interested in the satellite TV gound station and hope that they can exchange information and carry out further talks with the research institute. HONG KONG BUSINESSMEN INVEST HEAVILY IN XIAMEN

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 20 Dec 85 p 3

[Text] Hong Kong investments account approximately for 65 percent of foreign capital in the Xiamen Special Economic Zone and rank in the first place.

According to statistics, since its founding in 1980, the Xiamen SEZ has signed 280 contracts with foreign and Hong Kong investors on joint venture, cooperative, and wholly-owned business projects involving a total investment of $614 million. Among them, 217 projects are funded by Hong Kong investments amounting to $399 million.

Hong Kong investments cover a wide range of businesses including industrial production, real estate, communications and transport, tourism, and commerce. The development of the Huli industrial district as a whole and the soliciting of foreign investment for this purpose are taken care of mainly by the Xiamen SEZ Joint Development Company, which was jointly established by 13 Chinese banks in Xiamen and Hong Kong. This company is planning to invest 300 million yuan in Huli to carry out 20 projects.

Many projects funded by Hong Kong investment in the Xiamen SEZ have begun to yield relatively good economic results. Yongtai Electronics, Ltd., which is wholly owned by Hong Kong investors, produces multi-purpose computer telephones and sells all its products abroad. Xiamen and Baodun Investment, Ltd. of Hong Kong cooperated in building the New Hubin Overseas Chinese Village. Since houses built during the first and second phase of construction sold well, they signed another contract on the third phase of construction.

Since the beginning of 1985, the number of Hong Kong businessmen engaging in real estate in Xiamen has increased markedly. As of today, four companies--the Meihui, Baiying, Jianyuan, and Longquan--have signed contracts with Xiamen, deciding to cooperate with Xiamen in building a number of apartments, high rises, new residential areas, and villas with a total floor space of about 150,000 square meters.

Hong Kong businessmen are also front runners in the capital import of the Xiamen SEZ. China's first joint venture bank--the Xiamen International Bank, which was opened at the end of November 1985--was established jointly by Fujian Province and the Pan-Indian Corporation, Ltd. of Hong Kong.

XIAMEN BECOMES EXPORT-ORIENTED

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 8 Jan 86 p 3

[Text] By opening up avenues for foreign exchange earnings, Xiamen City exported over 100 million yuan of local products in 1985, a 50-percent increase over 1984, thereby accelerating the transfer of the zone's economy to an export-oriented one.

In 1985, the Xiamen City Government adopted some preferential measures. For instance, it allowed enterprises which produced new export products to deduct interest on loans, designated specialized foreign trade companies as export agents for products made in the zone, awarded enterprises which earned a remarkable amount of foreign exchange, and made concrete stipulations regarding the sharing of foreign exchange earnings. These measures aroused the enthusiasm of enterprises producing and dealing with export products for earning foreign exchange. Many enterprises which produced traditional export products worked to upgrade products and increase export volume. In spite of the considerable amount of difficulties in exports in 1985, specialized foreign trade companies organized sources of goods in all fields and managed to export over $17 million of products on behalf of the Xiamen SEZ by November 1985.

In order to keep foreign trade channels unclogged, Xiamen City further reformed the foreign trade system and increased the number of industrial enterprises, which handled exports on their own, to 36. These factories combined industrial and trade processes, directly contacted, negotiated with, and signed contracts with foreign businessmen, promptly organized production in accordance with foreign economic information, and opened up new export channels. As of today, industrial enterprises have earned $3.5 million by exporting products on their own. At the same time, Xiamen City also began to handle entrepot trade. In 1985, the city established duty-free warehouses to store electrical appliances, steel products, machinery, equipment, and other imported commodities and then ship them out to other countries. This business has raked in over $10 million of foreign exchange in storage fees, freight, processing fees, and service charges. Currently, countries and areas using Xiamen as an entrepot are Hong Kong, Japan, the United States, and the European Economic Community.

STATE ALLOCATES MORE AID FOR MINORITY NATIONALITIES

OW051733 Beijing XINHUA in English 1423 GMT 5 May 86

[Text] Beijing, 5 May (XINHUA)--China is to allocate more than nine billion yuan this year as subsidies and special funds to areas inhabited by minority nationalities, an official of China's Nationalities Affairs Commission said today.

This is 600 million yuan more than the figure last year, added Batu, director of the commission's finance and economics department.

He said that, apart from a 10 percent raise in financial subsidies, the country will also increase its development funds to the five autonomous regions of Xinjiang, Tibet, Inner Mongolia, Ningxia and Guangxi as well as to Yunnan, Guizhou and Qinghai provinces.

He explained that these subsidies and special funds include mobile and reserve funds for areas which have autonomous areas for minority nationalities, subsidies for capital construction in frontier areas and allowances for minority nationality areas.

The official, who is of the Mongolian nationality, said the state will also earmark 100 million yuan to help spread primary-school education in areas inhabited by minority nationalities in every year of the Seventh Five-Year Plan period (1986-1990).

He urged minority areas to make good use of these funds so as to speed up economic construction in these areas and improve the material and cultural life of minority nationalities.

LIAOWANG REPORTS ON ECONOMIC REFORM IN BULGARIA

HK061440 Beijing LIAOWANG in Chinese No 16, 21 Apr 86 pp 34, 35

["Special dispatch" from Sofia by contributing correspondents Sun Weixi [1327 4850 3556] and Wang Jinbo [3769 6855 2672]: "The Bulgarian Communist Party has Decided on the Policies for Scientific and Technological Revolution and Economic Reform"]

[Text] "The reform we have embarked on is not only broad in scale and complex, but also rigid. We must blaze a trail through all manner of difficulties and will meet with many things we do not know. However, for the sake of the people and social progress and in order to work for the well-being of the people, we must carry the reform through to the end because we have started it." This call was made by Todor Khristov Zhivkov, general secretary of the Bulgarian Communist Party [BCP] Central Committee, to all party members and the nation in his speech opening the 13th Party Congress.

The 13th Party Congress was held in Sofia on 2-5 April. Zhivkov delivered a report at the opening ceremony. The meeting approved the Ninth 5-Year Plan and the national program for social, economic, and cultural development before 2000 and decided on the basic principles for scientific and technological revolution and economic reform in the next 15 years. At the 1st plenum of the 11th BCP Congress, 75-year-old Zhivkov was reelected general secretary. This was the eighth time he was elected top leader of the BCP Central Committee since he held the post of the party's first secretary in April 1956.

Attach Primary Importance to Scientific and Technological Revolution

The 13th BCP Congress attached strategic importance to scientific and technological revolution and placed it "before everything else" in the party. In his speech opening the congress, Zhivkov pointed out: "Scientific and technological revolution is suited to socialist society and also to the law of the development of capitalist society. For us, the promotion of scientific and technological revolution is aimed at building a developed socialist society." Therefore, "We must conduct a profound reform."

Bulgaria covers an area of over 110,000 square kilometers and has a population of about 8.9 million. In the prewar period, it was a poverty-stricken agriculture country and one of the most economically backward nations in Europe. Through more than 40 years of hard work, Bulgaria has been built into a relatively developed industrial and agricultural country. In the early 1980's, the national income was 11 times greater than the figure of 1939, a year with a distinguished record in the prewar period, and industrial goods, instead of primary farm produce, constituted a large proportion of export commodities. The country ranks 14th among the world's 29 exporters of machinery. Bulgaria is short of raw materials and energy. The extensive development of the national economy for many years in the past should be replaced by intensive development. Therefore, scientific and technological revolution will become a "super key" to the development of the national economy. In his speech, Zhivkov pointed out seriously: "Our science, both in promoting material progress and in developing cultural and social progress, is still divorced from actual conditions, and it has not been turned into omnipotent productive forces which can promote social progress in an all-round way." He also stressed: "We must make good use of foreign scientific, instrumented mechanisms. This is and will be of great value to our country, which has limited material and human resources."

The 13th BCP Congress attached great importance to the growth of intellectuals and scientific and technical personnel. In his speech at the congress, Zhivkov noted: "We must considerably change our remuneration and incentive methods as well as the forms and methods for raising the professional skill of scientists, engineers, designers, and highly-skilled experts."

"Economic organizations of self-government" have been set up according to a resolution adopted by the BCP Central Committee plenum in February 1985. They maintain independence in the financial, production, management, and legal aspects and are of socialist nature, which can produce material and spiritual wealth.

The 13th BCP Congress pointed out: Implementation of the "principle of self-government" is aimed at "changing the principle of departmental management in economic work, getting rid of bureaucratic practices, and transiting to new planning and management methods," because the principle of departmental management "is no longer able to play to positive role" under the new historical conditions and "runs counter to the new trends of scientific and technological advance." This is why "we must remove obstacles and combine formation of strategic plans with the ample power and initiative of self-government organizations."

In order to stimulate the reform, an "economic committee" was established in January 1986 as a "supplementary organ for implementing state economic policies." All resolutions adopted by the economic committee within the limits of its authority are equally authentic as decrees issued by the national assembly. In formulating and implementing economic policies, the economic committee exchanges views with economic organizations of self-government, and by so doing, it establishes mutual relations with the State Planning Committee."

In his speech at the 13th BCP Congress, Zhivkov stressed: "Economic organizations of self-government are engines of economic activities, they implement state economic policies, and work as producers of socialist commodities. A new type of relationship must be established between economic organizations and government departments. Such a relationship enables them to play their role of commodity producers on the basis of self-government in the whole course of reproduction."

Economic Race and Competition

In the light of Zhivkov's report and summary made by the BCP Central Committee, the 13th BCP Congress called for economic race and competition at home and abroad in future economic development.

Zhivkov said: "In my opinion, there is no reason for us to fear competition. We have no grounds to continue nursing our commodity producers in hothouses. Experience teaches us that we have been in a state of competition for a long time." From now on, "Economic mechanism should become an effective means in promoting emulation and competition among socialist organizations. Economic mechanism should respect the interests of both consumers and commodity producers."

In order to meet the needs of carrying out scientific and technological revolution and economic reform in the country, government organizations were readjusted with a change of personnel before the 13th BCP Congress. The plenary session of the party Central Committee held in January this year decided to set up an economic committee, a social committee, and a scientific, cultural, and educational committee (at the 20th meeting of the national assembly held in March this year, the scientific, cultural, and educational committee was redesignated as a committee for spiritual development); disbanded the State Planning Committee and the Ministry of Foreign Trade; and established many relevant departments. Following the readjustments of government organizations, there was a series of personnel changes. According to an incomplete estimate, personnel changes before the 13th Party Congress involved 32 cadres, including the chairman of the national assembly, ministers, and vice ministers. This was the greatest reshuffle of senior government officials in Bulgaria in recent years.

The new leading body of the BCP Central Committee elected at its 13th Congress comprises 22 persons: 11 full members and 4 candidate members of its Political Bureau and 9 members of its Secretariat (4 members of the Secretariat are also members of the political bureau). The average age of all members of the Political Bureau is 58.6. In terms of the composition of the Political Bureau as a whole, it has gained more leaders in their prime with professional knowledge who have been appointed to take charge of economic work.

LIAOWANG ON SOVIET REFORM OF ECONOMIC STRUCTURE

HK281345 Beijing LIAOWANG in Chinese No 15, 14 Apr 86 pp 32-33

[Article by Mao Rongfang [3029 5554 5364]: "The 27th CPSU Congress and Reform of the Economic Structure"]

[Text] The 27th CPSU Congress convened not long ago ascertained the strategy for accelerating Soviet social and economic development proposed by the April 1985 CPSU plenary session. It is regarded as a key to solving all problems of the Soviet Union -- short- and long-term, economic, social, political and ideological, internal as well as external. The approaches to realize this strategy for development are: Accelerating the progress of science and technology, readjusting the investment policies and structure of the national economy, and improving the efficiency of the national economy's management. All this, in the final analysis, is determined by whether it is possible for basic reform of the existing economic system to succeed.

Evaluation of the Existing Economic Structure

Is it necessary to carry out basic reform of the existing domestic economic structure? For a long time, opinions have differed on this question in the Soviet Union. One opinion is that production relations and the nature of productive forces will automatically adapt to each other under socialism; therefore, the economic structure in operation will also automatically adapt to the nature of the development of productive forces; regarding which, no reform is necessary; only some improvement will suffice. Objective causes often take the blame for problems and difficulties emerging in the economy. Since improvement in the economic structure was carried out in 1965, the Soviet Union stressed only "making perfect and complete" the economic structure in operation, but never mentioned reform, not to say basic reform. It is precisely under the guidance of such a concept that the economic structure formed under the historical condition of the 1930's has undergone important reform, save some partial and minor mending.

The 27th CPSU Congress made an entirely different evaluation of the existing economic structure. In this political report, Gorbachev criticizes the so-called theory of automatic adaption and aptly points out that the existing Soviet economic structure which took shape under the condition of extensive development has "gradually become outmoded" begun to lose its stimulation, and even become a roadblock to the development of productive forces. It is precisely based on such an analysis that the 27th CPSU Congress formulated its principle that basic reform should be carried out of the existing economic structure instead of partial improvement. Opinions abroad believe that this is a breakthrough in the udnerstanding of the CPSU leadership, which gives the green light to the reform of the Soviet economic structure.

Basic Direction and Essence of the Reform

Reform primarily involves the emancipation of minds and eradication of prejudices. Gorbachev stresses that it is necessary to eliminate conventional thinking and mode of practice and that some theoretical views and concepts should be dealt with in a new approach, starting from the needs of realities. This applies to theoretical issues having a direct bearing on the reform of the economic structure in particular, such as the interaction between productive forces and production relations under socialism, the relation between socialist ownership and the economic form realizing such ownership, the relation between commodities and money, and the linkage between the central authorities and the self-decision power of economic organizations.

The aim of the reform of the economic structure is to make social production meet social needs. It is necessary to make management try to improve the economic results of social production and product quality, step up the progress of science and technology, and bring into play the initiatives and socialist enterprising spirit of all links in the national economy, labor collectives primarily, and the workers' concern for the result of their work. The basic direction and essence of reform are:

1. Readjusting the economic relation between the state and the enterprises. The basic concept is the focus on the dialectical unity between centralizaton and decentralization. On the one hand, the central level is required to go all out to grasp macrocontrol over the economy, namely the basic target of relevant economic strategy, and the rate and proportion in the development of the national economy, and its balance. To achieve this, it is primarily necessary to reorganize the work of the State Planning Committee, ridding it of the day-to-day economic affairs, so that it may become a genuinely scientific advisory department of the state and may improve its efficiency in centralized leadership of the economy. On the other hand, it is necessary to expand the decisionmaking power of the enterprises and to heighten their responsibility for the final economic results of their work. Production corporations and enterprises should become complete economic accounting units with self-raised funds, and their role as socialist commodity producers should be strengthened. And second, in the agricultural managerial structure, the economic relations between the state, the collective, and the individual will also be readjusted. The 27th CPSU Congress proposed two new measures: First, the state will stipulate a fixed annual product purchase quota in the 5-year plan for collective and state farms; the overfulfilled portion is left to the farms' disposal. Second, in continuing to promote the collective

contracted responsibility system for production teams and groups, the contracted responsibility system on the household basis will also be spread. For a long time, opinions have differed on the contracted responsibility system on the household basis, and there is no end to the debate. However, this form of labor organization and work payment was affirmed for the first time in the political report of the 27th CPSU Congress. The 20 March issue of PRAVDA even published an article to propagate the advantages of the contracted responsibility system on the household basis when criticizing some people for underestimating, and even strongly opposing, the contracted responsibility system on the household basis. These two reform measures are expected to promote the initiatives of agricultural labor collectives and individuals and accelerate agricultural development.

2. Strengthening utilization of the relation between commodities and money, and adopting the approach of economic leadership. The 27th CPSU Congress explicitly proposed reforms in the existing systems of materials and technology supplies, prices, finance, credit, and economic stimulation.

The direction for reform in the system of materials and technology supplies is to develop the lateral linkage between production enterprises and their customers -- namely, setting up long-term economic linkage between the two parties on the basis of a contract -- so that demand and supply will come together face to face in developing the wholesale business of production means. The wording in the reform of the price system is rather cautious. It is only mentioned that the price system should be reformed in a planned way on principle, so that it may have greater flexibility and more effective economic accounting may be implemented. However, the reform must be suitable for the task of raising the actual income of the citizens. Regarding the principle for price formation, it explicitly proposes that consideration should be given not only to production cost, but also the property, quality, and usefulness of products, as well as the law of supply and demand. It is estimated that no important changes will take place in the highly centralized Soviet price control structure. It will stimulate the progress of science and technology, and improve product quality chiefly by means of a price rise for good quality products and a price cut for inferior products.

On the financial and credit systems, Gorbachev criticizes the practice of covering deficits of backward units and localities by means of large-scale redistribution of profits of enterprises and departments as well as local income. He believes this practice has shaken the economic accounting system and brought about the phenomenon of relying on others for support, which has actually weakened the effects of financial credit on the economy. The task of the reform of the financial and credit systems is to carry out economic stimulation in the economic activities of enterprises and to strengthen economic accounting. An important component of the reform of the financial and credit systems is to make complete and perfect the measures of turning over circulation tax, profits, and other budgetary payment.

In economic stimulation, the guiding idea is to link material incentive organically with material punishment, and to change the practice of "stressing material rewards only without meting out necessary punishment," as was the case in the past. In specific measures, it is necessary to embody the principle that the incomes of the labor collective and the individual depending directly on the results of the managerial activities of the enterprise and the work result of the worker, and egalitarianism must be overcome.

3. Reforming the organizational structure of management. The basic orientation is to strengthen trans-departmental economic linkage, to develop all kinds of economic combination, and to streamline managerial links. First, numerous professions will be combined into a number of comprehensive entities, each comprising mutually connected departments. For example, the agricultural-industrial comprehensive entity formed not long ago is set up on the basis of six departments related to agriculture. Under preparation are the machine building comprehensive entity and the fuel comprehensive entity. Such comprehensive entities are favorable for overcoming departmental barriers and strengthening the lateral linkage between departments. And second, the original 3-level managerial system -- ministry, industrial corporations, and production corporations -- will be streamlined into a 2-level managerial system -- ministry and production corporations -- and the intermediate link, the industrial corporations, will be removed. At the same time, departmental management and local management should be rationally connected.

4. Realizing all-round managerial democratization. In this respect, the importance of the human factor is stressed. The 27th CPSU Congress proposed, on principle, the role of workers in management, the strengthening of socialist self-rule and supervision from bottom to top, and making it a system of the work report of economic organs and its openness to the public.

Reform Has Just Begun

The 27th CPSU Congress expressed its determination of the basic reform of the existing economic system and drawn out the basic outline and major respects of reform from now on, but it has not drawn up a specific plan for reform. Looking at the basic outline, the reform from now on will make greater breakthrough compared with the past project set in the key tune of "making perfect and complete."

In 1984, the Soviet Union carried out an economic experiment in more than 700 production corporations and enterprises under 5 ministries, the contents of which included the essentials of the conception for the current reform of the economic structure. The realm of economic experiment gradually expanded in 1985 and 1986. The conditions for economic experiment are planned to become the managerial conditions for all industrial enterprises in 1987.

The Soviet reform of the economic structure has just begun at present. Reform is a very complicated and arduous task. It will involve all respects of social and economic life. All kinds of difficulties, resistence, and even new contradictions will come up in the course of reform. Regarding historical lessons, successes are difficult if comprehensiveness and resoluteness are not persisted in. The 27th CPSU Congress has attached importance to historical lessons. However, to achieve this, it needs not only determination but also time and unremittent efforts.

NATIONAL POLICY AND ISSUES

STRENGTHENING OF ENTERPRISE VIGOR DISCUSSED

Fuzhou FUJIAN LUNTAN [FUJIAN FORUM] in Chinese No 7, 5 Jul 85 pp 22-23, 38

[Article by Huang Ruilin [7806 3843 7207]: "How to Further Strengthen Enterprise Vigor"]

[Text]

I

In strengthening enterprise vigor, the state must provide policies and the necessary external conditions, the crux of which is the implementation of enterprise autonomy. In the past few years, more autonomy was first granted to small urban enterprises while large and middle-sized enterprises were expected to carry the burden of turning over more funds to the state and fulfilling the production tasks called for in directive planning. Now that small enterprises have been invigorated, the large and middle-sized enterprises are faced with a serious challenge. The problem of enlivening further large and middle-sized key enterprises should be placed on the current agenda. This will require, first of all, the expansion of further autonomy for these enterprises by: 1. Shrinking the scope of directive planning, at the same time leaving the enterprises with more room to maneuver so that they can overfulfill their targets. The enterprises should be given charge over a larger share of goods in short supply on the market and be allowed to sell any amount produced over the quota. 2. Appropriately reducing adjustment taxes on large and middle-sized enterprises that get good economic returns, contribute a lot and produce a great deal of profit while retaining little of it. 3. Raising the depreciation rate on fixed assets to resolve the difficulties of large and middle-sized key enterprises in finding sources of capital for technological renovation. 4. Expanding the scope of rewards for conserving energy and raw materials. Individual rewards for conservation should not be limited to the 16 categories of material goods stipulated last year. With the approval of the prefecture and municipality, rewards should be granted to units whose rate of material depletion is lower than that of last year. 5. Granting some large and middle-sized enterprises the right to deal directly with foreign business concerns. Under the centralized principles, policies and planned guidance of the state, these enterprises should be able to directly import technology, engage in joint ventures, cooperative production, and compensation trade with foreigners. They should be able to import the equipment, instruments, and maintenance and other parts they need, and have the right to negotiate and sign contracts with foreign businessmen. 6. Freeing these enterprises to diversify production while concentrating on one area. Based on the prin ciple of making full use of advantages, mutual benefit, and voluntarism, they should be able to cross the boundaries of region and industry to engage in diversified, cooperative operations, including developing tertiary industry, without the interference of supervisory departments. 7. Implementing contract systems of responsibility, leasing and transferral of rights in some state-run small enterprises. The crux of the matter at present is now that the state has given more power to the enterprises, it has to really go through with it without interfering or chipping away at those rights at each level. The state certainly should not be allowed to withdraw in secret what it has granted in public.

II

Methods for strengthening enterprise vigor must be found within the enterprise itself, and a complete reform must be conducted. Although external conditions are admittedly important, internal factors are central. In addition to the provision of policies and implementation of the granting of autonomy to the enterprise by the state, the enterprise must take its own measures in order to genuinely increase its vigor. This is because the vigor of an enterprise is decided, in the end, by its quality. The quality of a great majority of enterprises at present is still not high. For some time, they have relied on inexpensive raw materials and agricultural byproducts and low wages to maintain production, which has hidden their backwardness. Now the situation has changed, and both costs and losses have increased for many enterprises. If this were calculated in terms of prices on the international market, a large percentage of profitable processing enterprises would show losses. If this is not altered, the enterprise will have no way to survive the intense competition on domestic and foreign markets. To improve enterprise quality and strengthen enterprise vigor requires a complete internal reform. At present we must emphasize the following reforms:

First, we must reform the enterprise's internal management system and institute systems of economic responsibility at every level. This will have a remarkable effect on the implementation of other reform measures and the overall improvement of enterprise quality. In the past 2 or 3 years, many enterprises have learned from the Shougang experience, achieving gratifying results in implementing internal systems of economic responsibility. However, the development of these systems has been uneven and only a few have done a good job of it. Standards for most enterprises have been low, and for some, reform has simply been a matter of surface, formalistic change, while some enterprises have not even begun. We must further improve the enterprise's internal economic system of responsibility, divide up the economic responsibilities given by the state to the enterprise among all units and individuals subordinate to it and devise systems of personal economic responsibility in production, technology, and specialized management, in order to promote the integration of responsibilities, rights, and profits.

Second, we must reform the enterprise's internal leadership system and implement a system in which the factory director is in charge. Modern enterprises are characterized by a fine division of labor and a high degree of continuity in production. Technical requirements are strict and relations of coordination are complex. Therefore, a centralized, strong, highly effective system of production command and business management must be created, which can only be accomplished under a system of responsibility with a single director at its head. Fairly profound traditions and habits have been left us by the past implementation of the system of responsibility in which the plant director functioned under the secretary of the party committee, so not all of us have the same understanding of the factory director system. Therefore, on the basis of a genuine summation of the experiences of pilot projects, we must promote and comprehensively implement the new system. We must grant the factory director the power to command and make important decisions regarding the administration and management of the entire plant. At the same time, there must be a clear separation of the functions and limits of power of the party, government, and labor section so that a correct balanced relationship exists among the three. The supervisory and guaranteeing role of the party committee must be brought into full play.

Third, we must reform the enterprise's wage system and distribution of bonuses and implement the principle of each according to his labor. This will be an important measure in balancing the relationship between the workers and staff. The State Council has decided to reform the wage and bonus system in enterprises so that the total amount of wages and bonuses are linked up with economic returns and will fluctuate proportionately. The state has only ratified the total amount of wages and bonuses. Outside of that, it is up to the enterprise to determine its own wage system and means of distributing bonuses. Enterprises can use different forms of wages based on their particular production characteristics and management conditions. No matter what form is selected, there must be a connection between the workers' wage income, the enterprise's economic effectiveness, and labor productivity. The wage form must reflect the size of the individual's contribution to the state and the quality of his performance in order to reward industriousness, punish sloth, and enable workers to receive more for working more. Through concern for their material interests, the workers will learn to feel concern for the enterprise's production and sales, thereby increasing the economic effectiveness of the enterprise.

Fourth, we must reform methods of enterprise business management and shift from the simple production form to an open operations form in order to adapt to competition on the market under new conditions. The socialist economy is a planned commodity economy built on a foundation of the system of public ownership. In any commodity economy there is inevitably competition. As a relatively independent producer and manager of commodities, the enterprise must participate in competition on the market. This necessitates that enterprise leadership have a grasp of the concepts of the marketplace, of input and output, of finance, and of the development of intellectual resources. In order to adapt to this change, the enterprise must create "open operations type" management organs, improve market research, stress business-related policy decisions, constantly improve their technological level and business management methods, provide good-quality, inexpensive products that satisfy needs, provide good service, maintain a high reputation, and develop and seek victory in competition.

III

While strengthening enterprise vigor, we must also improve macroeconomic management. The more we enliven the economy, the more we must emphasize macroeconomic adjustment. If we were to say that the entire economy is like a huge, organic entity, then the enterprise is a cell within that organism. The relationship of the enterprise to society's economy is one of the microcosm to the macrocosm, of the part to the whole. The survival of the cells is the foundation of the survival of the organism. When the cell is "lively" the entire organism can develop healthily. If not, the cell can only show "vigor" and a normal metabolism by maintaining each part of the entire organism and the coordination and balance of all parts. In other words, only when the entire national economy is balanced and developed in a coordinated fashion, does the enterprise have a possibility of being invigorated. Therefore, invigorating the enterprise and the necessary macroeconomic controls and management are mutually complementary and not antagonistic.

It should be realized that the current overall economic reform is at a stage in which new forms are in the process of replacing the old. The influence of the old "everyone eats from one big pot" form has not yet totally faded, and the new-style mechanisms are not yet perfect, which easily leads to inflated demands and loss of macroeconomic control. Last year, due to their selfish departmentalism, some localities and units indiscriminately raised the wage scale, issued bonuses, subsidies, goods and gifts and indulged in great waste. Nor did they turn over to the state the excess bonus tax according to regulations. Banks competed to issue loans and ignored the need for comprehensiveness and balance in the utilization of foreign exchange. All this created difficulties for the development of the economy and disturbed the process of the overall economic reform. Therefore, at the same time that we further invigorate the enterprise, we must also make an effort to strengthen macroeconomic management and prevent loss of control.

Our present emphasis on regulating the management of the macroeconomy does not, by any means, imply a return to the old ways or a restoration of the original rigid macroeconomic system of control which often squeezed the life out of enterprises. It means, rather, that we must study, create, and perfect a macroeconomic management and regulation system that is suited to a planned commodity economy, so that there are close but successful controls over larger projects and items, and loose, invigorating guidance over smaller ones. Particular attention should be paid to strengthening the following aspects of macroeconomic management: 1. Strengthening credit management, controlling the issuance of currency and ceasing the overly liberal provision of funds. In order to control the issuing of currency, an enterprise that applies for credit must have a certain amount of its own capital. The banks should have the power to inspect and supervise how the enterprise utilizes its funds. 2. Strengthening management over consumption funds to avoid out-of-control increases. 3. Controlling the scope of investment in fixed assets. Capital construction and technological improvement projects should be conducted only according to our capacity to do so within the plan. 4. Strengthening foreign exchange management. We must encourage the enterprise to earn more foreign currency while using less and seek to achieve a balance between its imports and exports. 5. Strengthening financial discipline. We must resolutely put an end to unhealthy tendencies and improve management over finances, taxes, auditing, commodity prices, and industrial and commercial administration. Educating the workers and staff to gain an understanding of the state, the overall situation, of planning, policies, and discipline must be improved. We must correctly balance the interests of the whole versus the part, and short-term versus long-term profit, so that enterprise reform and the invigorating of the economy can proceed in a correct direction.

DEVELOPMENT STRATEGY FOR TOWNSHIP, TOWN ENTERPRISES

Beijing NONGYE JISHU JINGJI [ECONOMICS FOR AGRICULTURAL PRODUCTION TECHNOLOGY] in Chinese No 11, Nov 85 pp 13-15

[Article by He Junwei [6320 6511 0251] and Li Xiangang [2621 7359 0474] of the General Administrative and Management Office of the Ministry of Agriculture, Animal Husbandry and Fishery: "A Discussion of the Development Strategy of Township and Town Enterprises"]

[Text] The Development Process of Township and Town Enterprises

China's township and town enterprises were developed on the basis of the rural handicraft industry along with the development of the cooperative transformation of agriculture. During the early period of the cooperative transformation of agriculture, approximately 1 million farmers who were also dealers of handicraft commodities and some professional handicraftsmen living in the rural areas joined agricultural cooperatives. With these people serving as backbone forces, some workshops and small processing plants were established to carry out sideline production under the administration of agricultural cooperatives. These sideline occupations which were nurtured in the body of agriculture laid a solid foundation for the later development of commune- and brigade-run enterprises. According to estimates, the national output value of these occupations reached 10 billion yuan at the end of 1957. According to the statistics of the State Statistics Bureau, in 1958, there were 260,000 commune-run industrial enterprises throughout the country and their output value totalled 6.2 billion yuan. During the difficult period, commune industries were seriously affected. In 1961, the national output value of commune industries declined to 1.96 billion yuan. In the following year, it declined to 790 million yuan. By 1963, it was only 410 million yuan. It was not until the mid and late 1960's that the situation began to improve. By 1970, the output value of commune industries had been basically restored to the level of the late 1950's. During the "Great Cultural Revolution" period, commune enterprises were mainly rural industries based on the two levels of communes and production brigades. In 1976, the national output value of commune- and brigade-run enterprises reached 27.2 billion yuan, of which, the output value of industries at commune and brigade levels accounted for 24.3 billion yuan--12.4 billion yuan at the commune level and 11.9 billion yuan at the brigade level.

In the few years following the 3d Plenary Session of the 11th CPC Central Committee, tens of thousands of township and town enterprises mushroomed and their output value increased at an average annual rate of 14 percent. By 1983, their total output value had already reached 99.9 billion yuan. In 1984, the central government issued documents No 1 and No 4 which accelerated the development of township and town enterprises. In that year, a new situation appeared, in which "five wheels"--enterprises run by townships (towns), village (brigade) production teams, enterprises run jointly by commune members, and enterprises run by individuals--turned all at the same time. According to statistics, their total output value reached 170.9 billion yuan, an increase of 40 percent over 1983. Of which, the output value of township and town industries accounted for 125.4 billion yuan, their profits reached 18.7 billion yuan in the same year, their tax and profit delivery to the state reached 9 billion yuan and their major products also increased by a wide margin. The total output value of township and town enterprises is now greater than the total value of China's industrial and agricultural output in 1957 and the production capacity of township industries is also greater than that of China's whole industry in 1964. Township and town enterprises have become a force that cannot be ignored in the state economic construction.

Current Characteristics

1. Multiple levels. Township and town enterprises are developed at multiple levels. With enterprises at the township (town) and village levels as dominant factors, township and town enterprises include cooperative enterprises jointly run by commune members, cooperative industries in other forms and enterprises run by individuals (see the following table).

The Multi-level Development of Township and Town Enterprises in 1984

Item	Enterprise		Output value	
	Number (10,000)	Proportion (%)	Output value (100 million yuan)	Proportion (%)
Township (town)& villages	165	27	1433	84
Commune members' cooperatives	90	15	126	7
Other forms	21	3	33	2
Individual enterprises	330	55	117	7
Total	606	100	1709	100

2. Multiple industries. Township and town enterprises is a general term for enterprises run by peasants. They are a rural economic system consisting of five major industries--agriculture, industry, communications and transport, the building industry and commercial services. As far as township and town industries are concerned, there are coal, power, chemical, metallurgical, building materials, forest, machine-building, food, textile, sewing, leather,

paper-making, cultural and educational and industrial arts industries. Judged from the development of the past few years, the set-up has been gradually rationalized.

3. Doing away with the restrictions of "three locals." During the early period of the establishment of township and town enterprises, a development principle promoting "local materials, local processing and local sales" was put forward. But, along with the development of the national economy and the reform of the economic structure, this principle has become less and less suitable for today's situation. As a result, in the past few years, township and town enterprises in some economically better developed areas such as Wuxi of Jiangsu, Ningbo of Zhejiang, Hainan of Guangdong and the outskirts of Beijing, Tianjin and Shanghai municipalities have done away with these restrictions, carried out "internal integration and external cooperation" and horizontal integration and cooperation between different industries, regions and ownerships and played the role as an "organic medium" to link urban and rural areas. The reform of the urban economic system has further accelerated the development of this trend, thus enabling urban and rural areas to change their divided economic relation to a coordinated one and forming a situation in which urban and rural economies develop in tandem.

4. More medium-sized and small enterprises. Township and town enterprises generally have a moderate scale. Most of them are medium-sized and small enterprises. Take the main part--enterprises at the township (town) and village levels--for instance. In 1984, there were 1.65 million enterprises and 38.48 million staff members and workers and their output value totalled 143.3 billion yuan, averaging 23 workers and 87,000 yuan of output value per enterprise.

5. Market regulation. About 5 percent of township and town enterprises' production is directly included in the state plan, another 10 percent is indirectly included in the state plan and the remaining 80 percent or so is regulated by the market. Compared with state-run enterprises, township and town enterprises may be considered as a mixed industrial system based on market regulation.

6. Imbalance. Judged from the national situation, the development and distribution of township and town enterprises are very uneven. The general situation is: Eastern areas are more developed than western areas, southern ares are more developed than northern areas, coastal areas are more developed than inland areas, flatlands are more developed than mountainous areas and city (town) suburban areas are more developed than rural areas. For instance, the output value of township and town enterprises of Beijing, Tianjin and Shanghai municipalities and Shandong, Guangdong, Zhejiang and Jiangsu provinces account for over 55 percent of the nation's total while that of remote border provinces and inland provinces such as Shaanxi, Gansu, Ningxia, Qinghai, Xinjiang, Nei Monggol, Guangxi and Yunnan account only for 5 percent of the nation's total.

7. Tendency toward cooperatives. Along with the increasingly deep reform of the rural economic system, the contracted management responsibility system has been widely adopted. In 1984, Jiangsu's experience--"one contract and three

reforms"--was publicized nationwide. As a result, the nature and position of enterprises have been gradually clarified, their decisionmaking power expanded, and their vitality increased. Since 1985, the tighter control of the state over the issuance of loans to township and town enterprises has once caused a great impact on the development of township and town enterprises. In many areas, the production of some enterprises is still suspended or half suspended due to a lack of funds. Many projects cannot be started due to a shortage of funds. Under such a condition, the masses of all localities have raised funds on their own to establish enterprises and formed many new types of joint-stock cooperative enterprises, thus accelerating the progress of the cooperative transformation of township and town enterprises.

Strategies and Countermeasures

Many problems that need earnest solutions have arisen in the course of the development of township and town enterprises. For instance, technological transformation and technological progress are slow; supply and marketing channels are constantly clogged; no scientific and technological information system is available to serve township and town enterprises; the management system is imperfect; some industries in some regions have increased too fast and exceeded the bearing capacity of natural resources; few farm and sideline products have had thorough processing and there are such phenomena as pollution and excessive use of farmland. At the same time, township and town enterprises are facing the reform of urban and rural economic systems and the challenge of the new technological revolution. Under such circumstances, we think that the general guiding ideology should be: Carry out readjustment and reform in accordance with the characteristics, face the challange, solve the problems, seize the opportunity and bring about sound development.

1. Combine agriculture and industry and combine urban and rural areas. China's township and town enterprises are infants just born out of the womb of agriculture. They have numerous links with agricultural production in regard to funding, labor, sites, land, raw materials and even labor time. Without the support of agriculture and the great development of the rural economy, township and town enterprises would have much difficulty achieving continuous and stable development. In the early 1970's when township and town enterprises had a new start, Jiangsu Province set forth the slogan of "carrying out industrial production in accordance with agricultural production and doing a good job in industrial production to bring along agricultural production." This slogan has been proved correct after being tested in the past few years. Although they should not limit their development with local materials, local processing and local sales after they are relatively developed, township and town enterprises still should consider agriculture a basis, find a foothold in rural areas and serve agricultural production because it is one of their characteristics and strong points. If township and town enterprises ignore agriculture, abandon farming to pursue industrial work or even abuse land resources because they have made some developments, the consequences would be very serious. Therefore, on the one hand, we should develop, according to local conditions, township and town enterprises in the fields of "industry, commerce, transportation, construction and services" that are beneficial to agricultural production and enable agriculture and township and town enterprises to link together in production and go forward hand in hand; on the

other hand, we should try to give priority to agricultural production in the distribution of financial resources and the use of labor and enable agricultural and township and town enterprises to merge into an organic whole in economic interests and reinforce each other. At the same time, township and town enterprises and large industrial enterprises should supplement each other. The development of the regional economy should rely on establishing and forming a multi-tier set-up for the regional economy including not only leading industries consisting of large and medium-sized back-bone enterprises but also "industrial groups" consisting of many medium-sized and small supporting enterprises. Only when each of their advantages is brought into play can we invigorate the economy. Practice has proved that whereever there are flourishing and advanced township and town enterprises (such as Jiangsu Province) there must be township and town enterprises and large and medium-sized enterprises supplementing, relying on and coordinating with each other in development. Otherwise, it is very difficult for township and town enterprises to develop.

2. Macrocontrol and microflexibility. Generally speaking, products produced by township and town enterprises are not included in the state command production plan. Do township and town enterprises need macroguidance and regulation? Some people think that because township and town enterprises are scattered everywhere and they develop spontaneously according to the supply and demand situation of the market, they have nothing to do with planning guidance and macrocontrol and it is also impossible to give guidance. We think that general macrocontrol and great microflexibility are necessary. Everybody knows that China's current pricing system is still very irrational and planned prices cannot yet objectively reflect the supply and demand situation of the market. Under this condition, if township and town enterprises rely only on the information provided by prices and plunge into something because it is lucrative, they are bound to throw their production into blindness, waste large amounts of labor, financial and material resources and find themselves following the crowd, rushing headlong into and out of things all at the same time. In the past, township and town enterprises used mainly local materials, engaged in primary processing of farm and sideline products and sold most of their products locally. But now many township and town enterprises have exceeded the scope of "three locals" and expanded their exchanges to an unprecedented scope. According to surveys, less than 10 percent of the raw materials used by township and town enterprises are included in the supply plan and slightly over 10 percent of their products are included in the sales plan. Under such a condition, failing to strengthen planning guidance and macrocontrol can cause blind production, result in losses and even disrupt the order of macroeconomic development. Therefore, we must, according to the demand of the macroeconomy, carry out overall balancing and give classified guidance while using such economic levers as tax and credit to regulate township and town enterprises. At the same time, departments concerned under the government and some social organizations should vigorously and voluntarily provide as accurate economic information as possible for township and town enterprises, formulate relevant policies, laws and regulations, coordinate economic relations between township and town enterprises and all other sectors and guide township and town enterprises to develop along a healthy path.

3. Establish the concept of "all-around development" and readjust the industrial structure. Whether the industrial structure of township and town enterprises is rational concerns the development orientation, scale, level and results of township and town enterprises as well as whether the national economy can develop in a coordinated manner. So, establishing a rational industrial structure is an important content of the development strategy of township and town enterprises.

Township and town enterprises are products of the rural economy in a certain stage of development. Their development depends on the all-around development of the rural economy. The signs of a rational industrial structure are as follows: First, the industrial structure of township and town enterprises is relatively coordinated with the national economy as a whole to provide necessary competition and mutual reinforcement; it should have the ability to absorb new technology, new products and urban industries that are transferred to and dispersed over rural areas, to supplement weak sectors of the national economy and to provide products in short supply. Second, the industrial structure of township and town enterprises should be able to bring along the development of the rural economy as a whole--namely, offer service before, during and after the process of agricultural production and force agriculture to develop toward specialization, socialization and commercialization; it should be able to provide funds for agricultural development and speed up the transformation of traditional agriculture into modern agriculture; it should be conducive to absorbing surplus labor of agriculture and increasing agricultural labor productivity; and it should be conducive to directly bringing along the development of other industries and promoting a fundamental change in the industrial structure of agriculture. As far as the internal structure of enterprises is concerned, a rational industrial structure should be able to yield good economic results, meet the needs of the market, have regional characteristics, combine high, intermediate and low level technologies and combine the efforts to develop local resources with the efforts to absorb resources from other areas.

4. Rely on science and technology in developing township and town enterprises. Leading comrades of the State Council recently pointed out that "agricultural structure cannot be reformed without developing township and town enterprises and there would be no future in developing township and town enterprises without relying on science and technology. The combination of the two makes it possible to create a new road suitable for China's national conditions. Therefore, we should consider it a long-term basic policy and hold on to it. We are bound to find some unexpectedly good results." In our opinion, first of all, medium-sized and small cities and township and town enterprises should develop "short, level and speedy" projects which closely combine science and technology with the economy and can be used as an example or an object of publicity. Namely, they are technological development projects requiring only a short period to transfer science and technology into commodities, involving applied science and technology that are appropriate to the technological level of medium and small enterprises and able to yield quick economic results. In other words. they are the "spark plan" set forth and implemented by the departments concerned. Second, they should extensively import useful and advanced technology to complete the technological transformation of traditional industries and other industries. Third, they should establish a flexible, effective management system and an information network. Fourth, they should accelerate exchanges between "the east and the west" and talks between "the north and the south," thereby realizing regional coordination, mutual reinforcement, common development and all-round revitalization.

EXPORT-ORIENTED ECONOMIC PATTERN FOR 3 DELTA ZONES

Beijing RENMIN RIBAO in Chinese 30 Oct 85 p 1

[Report by Fan Xiangqun [5400 0686 5028] and Guo Xianwen [6753 3759 2429]: "Adjusting the Structure of Agricultural Production According to the 'Trade-Industry-Agriculture' Pattern; Three Great Changes in the Coastal Economic Development Zones. Tendency Toward Rationalization of the Internal Structure of Agriculture; Faster Development of Agricultural and Sideline Processing Industries; 'Importing from Abroad, Linking Up With Domestic Economy' Greatly Expanded"]

[Text] Beijing, 22 Oct (XINHUA)--China's coastal economic development zones, the Zhujiang Delta, the Changjiang Delta and the Minnan [South Fujian] Delta, are implementing the "trade-industry-agriculture" principle, and gratifying changes are taking place in the structure of agricultural production. Technologically advanced processing industries for agricultural products are vigorously developing, and many famous and high-quality products as well as local specialties, which had been in decline and retrogression for a long time, are being restored and developed. Scores of improved agricultural varieties have been imported from abroad and have been allowed to take root and find a new home in our scenic land of rivers and lakes. A new pattern of a coordinated development of agriculture, forestry, animal husbandry, sideline production and fishery is beginning to emerge.

At the beginning of this year, the CPC Central Committee and the State Council have designated these three areas as economic development zones. It was demanded that they adjust the structure of their production according to a "trade-industry-agriculture" pattern. That means that processing of agricultural products be developed according to the needs of the export trade, that agricultural production be developed according to the needs of the agricultural products processing industry, and that advanced technologies be imported to enhance product quality, increase exports and realize larger foreign exchange revenue. For this purpose the provinces of Guangdong and Fujian have set up a coordinating organization for the development of the delta regions. The relevant provinces, prefectures and counties have drawn up basic programs for the long-range planning and development of export commodities of a foreign trade-oriented agriculture. This year the leading organs in all the various localities have strengthened macroeconomic guidance and service work for the adjustment in the structure of production in the rural areas, guiding the peasants to shift their sights from singularly targeting on production for the domestic market to targeting on production for both the domestic as well as the foreign markets. In the adjustment of the agricultural production structure of the three areas, three great changes have already taken place:

In the internal structure of agriculture there is now a tendency toward rationalization, toward diversification of products and toward the improvement of product quality. In the past, agricultural production in these three areas had basically focused on the production of grain, cotton and pigs, with little variety and of rather low quality. This year the emphasis in the readjustment at all places is on aquatic products, animal husbandry and cash crops, which have already brought about an initial change in the state of serious imbalance within agricultural production.

The development of the processing industry for agricultural and sideline products was speeded up, and raw material commodities became oriented toward processing and food preserving commodities. According to statistics for the city of Suzhou for the period of January to August this year, the output value of the agricultural and sideline processing industry grew at a faster rate than the growth rate in the value of the entire output from all township and town enterprises.

The "importation from abroad and linking up with the domestic economy" was further developed, and an export commodity base of a "trade-industry-agriculture" pattern has begun to emerge. During this year, the three areas intensified the importation of improved agricultural varieties and of advanced technologies. The provinces of Guangdong and Fujian established "separate zones for new imported agricultural varieties" on the islands along the coast, where imported improved agricultural varieties and improved types of poultry are tried out; if successful, they will be transferred to the mainland for extensive planting or breeding.

MINNAN DELTA EXCEEDS 1985 AGRICULTURAL EXPORT TARGET

Fuzhou FUJIAN RIBAO in Chinese 23 Dec 85 p 2

[Article by Chen Jinbo [7115 6855 2672] and Xue Xixing [5641 6932 2502]: "Minnan Delta Boosts Exports To Earn Foreign Exchange"]

[Text] The delta region in southern Fujian, an opened area, exports large quantities of oolong tea, canned mushrooms and fruits, native produce and animal byproducts, aquatic products, flowers, Chinese medicines and drugs, etc. From January through November, over 200 million yuan worth of goods were procured for export, which were more than the entire year's export target. Foreign exchange earnings are expected to reach $40 million. Oolong tea exports alone from the five counties and one municipality, including Anxi and Yongchun, came to 5,200 dan and fetched $8.68 million in foreign exchange. Canned mushroom and fruit exports amounted to 5,510 tons and raked in foreign exchange to the tune of $6 million.

To increase the foreign exchange income of agricultural exports, the region has gone all out to introduce superior breeds and varieties. So far they have imported Angora and New Zealand rabbits, Swiss milk goats, French, U.S., Cuban and Dutch cattle, Egyptian fei [7236] and nian [7664] fish, Indian pangolin (?) and Pacific oysters from Australia. Much attention has been paid to the development of production bases. In line with local conditions, Yongchun, for instance, has set up seven commodity production bases for fruits, tea leaves, Chinese herbal medicines, flowers, animal husbandry and fishery to provide the goods for export and earn foreign exchange.

FURTHER ADJUSTMENT OF INDUSTRIAL STRUCTURE DISCUSSED

Beijing XUEXI YU YANJIU [STUDY AND RESEARCH] in Chinese No 11, 1985 pp 11-14

[Article by Liu Hong [0491 3163] and Wei Liqun [7614 4409 5028]: "On the Readjustment of Industrial Structure During the "Seventh 5-Year Plan" Period"]

[Text] In order to draw up the "proposal" for the Seventh 5-year Plan, the CPC Central Committee set forth a series of new major strategic ideas, principles and policies for the economic and social development of the "Seventh 5-year Plan" period. One of the important aspects is to readjust the industrial structure more thoroughly, extensively and rationally in accordance with the demand of the development of the situation. This is an important part of gradually forming a new strategic pattern of economic construction. A successful solution to this problem is of crucial significance to the continuous, balanced and efficient growth of the national economy.

The Importance and Necessity of Further Readjusting the Industrial Structure

At present, China's economy has begun to enter a new stage of development. This is a stage in which the pattern of consumer demands will change to seek better quality and greater variety and economic growth will be achieved mainly by intensive means and by relying on scientific and technological progress. It is these new characteristics that have made the task of further readjusting the industrial structure more prominent to us.

Further readjusting the industrial structure is required first of all for the balanced all-around development of the national economy. Over a long period of time in the past, China's industrial structure was very irrational. Judged by major sectors of material production, the development of agriculture and light industry was slow and that of heavy industry was remarkably fast. Judged by internal structure of agriculture, forestry, animal husbandry, sideline production and fishing were extremely backward and the set up of agricultural production was unitary. Judged by the internal structure of industry, energy and raw material industries were extremely weak and the production front of the processing industry was overextended in comparison. Judged by the development situation of the tertiary industry, the tertiary industry lags far behind primary and secondary industries. This situation resulted in a serious dislocation of economic sectors and a prolonged phenomena of poor social and economic results. During the economic readjustment of the "Sixth 5-year Plan" period, in order to meet the need to change the disequilibrium of accumulation and consumption, we adopted effective measures to speed up the development of agriculture and the light industry and resumed a better balance among agriculture and light and heavy industries. However, we should realize that in the past few years, the problem of disequilibrium of the industrial structure of other sectors was not as acute and prominent as that of agriculture and light and heavy industries and we did not have the condition and ability to carry out overall readjustment of the industrial structure. Because of this, judged from the situation as a whole, the irrational industrial structure of other sectors has not been fundamentally improved. Now that the structure of major material production departments has become rationalized, it is necessary and possible for us to take further steps to promote the rationalization of industrial structure in a more thorough and extensive manner. Only by doing so can the national economy enter the orbit of an overall balance and steady development.

Further readjusting the industrial structure is to better meet the demands for a higher consumption level of urban and rural residents and changes in the consumption pattern. In the past few years, the income of China's rural and urban residents has increased markedly. And at present, Chinese are self-sufficient in food, clothing, grain and cotton production. Under this condition, the overwhelming majority of the people have already solved their food and clothing problems. They begin to demand consumer goods of better quality and greater variety. In food, their demand is changing from plain and simple to nutritious, convenient, sanitary and diversified food products. In clothing and appliances, their demand is changing from unitary and low-grade to new, beautiful, practical and high-grade products. In housing, they demand an increasingly larger living space. While material consumption is changing, the demand for cultural and service consumption is also increasing day by day. However, the current industrial structure, especially the production set-up of consumer goods, can no longer adapt to the trend of changes in the pattern of consumer demands. Should we fail to carry out readjustment immediately, the structural contradiction currently existing in the supply and demand situation of some commodities will become more prominent. Only when the industrial lineup is further readjusted according to the trend of changes in consumer demands and the characteristics of China's national conditions can we better satisfy the increasing demands of rural and urban residents in many fields and make it possible for economic development to fully demonstrate the purpose of socialist production.

Further readjusting the industrial structure is also required for promoting the modernization of the national economy and vigorously developing the commodity economy. The development of the modernization program and the flourishing of the commodity economy have set forth new demands on the material foundation, technological conditions, social services and management levels. One of the important respects is that we should have relatively solid basic industries such as energy and raw and semifinished materials industries, excellent transport and communications facilities and updated information network. We should also have developed science, education, and culture as well as commercial, financial, insurance, consulting and real estate services. Currently, China is very backward in these sectors. Therefore, only when we make up our mind to accelerate the development of energy, raw and semifinished materials, transport and communications industries and of the tertiary industry and promote the rationalization of the industrial structure can we effectively raise the level of modernization of the national economy and create a good environment and conditions for the vigorous development of a socialist commodity economy.

The Orientation and Substance of Further Readjusting the Industrial Structure

According to the need to develop the national economy in an all-around and balanced manner and accelerate the progress of the modernization and to keep pace with the improvement of the people's consumption level and with the changes in the pattern of consumer demands, the "proposal" points out a clear orientation and substance for further readjustment of the industrial structure in the "Seventh 5-year Plan" period and beyond. The main points can be summarized as follows:

First, continue to accelerate the all-around and steady development of agriculture. In the past few years, China has made unprecedented progress in agricultural production, but speaking as a whole, China's agricultural production level is still relatively low and neither quantity nor quality can meet the need to further develop the national economy and continue to improve the people's living standards. In the future, we still have to give agricultural development first priority in economic development, take further steps to bring about an all-around growth of agricultural production and conduct work at all levels. The first level is to do a down-to-earth job in grain production. At present, China's grain production is sufficient only at a low level. If we are to increase the grain possession level of 1 billion people by a wide margin and create better conditions for industrial development and the readjustment of the agricultural internal set-up, we must continue to maintain steady increases in grain output and never slacken our efforts. Under this prerequisite, we should vigorously develop various cash crops and invigorate the diversified economy. The second level is to speed up the development of forestry, animal husbandry, aquaculture and the breeding industry and increase their proportion in agriculture. China has vast land suitable for afforestation, grassland and water areas. It has favorable conditions for developing forestry, animal husbandry and fishing. Assuming that China's potential is tapped, there will be a great increase in these industries. The third level is to establish, according to local conditions, rural industries, transport and communications, construction, mining, and commercial and other service industries. This is an important way to give full play to China's abundant rural labor resources and invigorate the rural economy. In sum, we should accelerate the all-around development of agriculture, forestry, animal husbandry, sideline production and fishing and the comprehensive operations of agriculture, industry, commerce and transport, gradually realize the specialization, commercialization and modernization of the agricultural economy and do a better job in satisfying social demands.

Second, strive to open up the production range of the consumer goods industry. During the "Sixth 5-year Plan" period, China's consumer goods industry developed fairly fast and played an important role in stimulating the market and improving the people's living standards. However, compared with the changes in the pattern of consumer demands, the production range in this regard is still fairly narrow. Some daily necessities, especially high- and medium-grade commodities, are in short supply. From now on, while continuing to maintain a steady all-around growth, the consumer goods industry should put the emphasis of development on quality and novelty, vigorously increase the production of popular-brand and good-quality products, develop new varieties and products and establish new branches of production. Especially, it should consider food, clothing and durable consumer goods as three major points of the entire consumer goods industry and bring about greater and better developments in these branches.

Third, accelerate the development of the construction industry, especially the residential construction industry. In many foreign countries, the construction industry is very developed and a pillar of the national economy. In China, the construction industry, especially the residential construction industry, is very backward and accounts for only a very small part of the gross national product. A major cause of this phenomenon is that over a long period of time China implemented the policy of centralized construction and allocation of housing in urban and rural areas, collecting very little rent. In 1984, a working family's rent accounted only for 1.4 percent of its costs of living. This practice made the residential construction industry lose its vitality and vigor and stunted its growth for a long time. Now the state has decided to implement the policy of commercializing urban and rural housing. Experience has proved that the implementation of this reform can effectively accelerate the development of the residential construction industry and make it gradually become a major pillar of the national economy. The faster development of the residential construction industry can in turn speed up the housing construction of urban and rural areas and better meet the demand of urban and rural residents for better living conditions.

Fourth, strengthen the building of basic industries such as energy and raw and semifinished materials industries. The "proposal" sums up China's experience in the building of the energy industry and, according to the conditions of China's natural resources, points out that the development of the energy industry should focus on the power industry whereas the power industry should vigorously develop thermal and hydraulic power resources and systematically construct nuclear power stations in selective areas. The coal industry should speed up its development by tapping the potential of and revamping existing collieries and by constructing a number of new mines. The petroleum industry should step up prospecting for oil and natural gas resources, strive to increase the output of crude oil and locate more reserves by doing a good job in revamping, renovating and expanding old oilfields. The raw and semifinished materials industry should vigorously increase products in short supply, strive to raise the technological level and increase the variety and quality of products. According to these policy decisions provided by the "proposal," we should strengthen weak links such as energy and raw and semifinished materials industries while properly restricting the development of general processing industries so as to gradually coordinate the relations between basic industries and the processing industry.

Fifth, ensure that priority is given to the development of the transport and communications industries. At present, the transport and communications industries are even weaker than energy and raw and semifinished materials industries. This has not only seriously stunted the growth of the economy as a whole but also caused gross inconveniences for the people's everyday life. Therefore, transport and communications development must be considered the top priority of national economic development. This is an important link in further rationalizing and readjusting the industrial structure. In transport, we should be determined to change the past practice of overemphasizing railway construction and pay more attention to the construction of highway, water and air transporation while continuing to do a good job in railway construction. We should strive to improve the set-up of transportation, and gradually establish a comprehensive transport network. At present, we should pay special attention to doing a good job in the rational distribution of various modes of transportation and improve the efficiency and quality of transportation. At the same time, we should increase, accordingly, the means of transportation such as automobiles, locomotives, vessels and airplanes. In communications, we should concentrate on expanding the capacity of long-distance telephone services in large- and medium-sized cities, especially coastal open cities, and strengthen the development of modern means of communications such as communications and broadcast satellites.

Sixth, put the development of the tertiary industry in a prominent place. The emergence and development of the tertiary industry is an inevitable trend resulting from the further development of the social division of labor and the continuous improvement of labor productivity. It is a major characteristic of a modern economy. The development of the tertiary industry is based on the development of primary and secondary industries whereas the expansion of the tertiary industry can markedly increase the results and efficiency of the use of capital and resources, thereby effectively accelerating the development of primary and secondary industries. Because of this, vigorously developing the tertiary industry and increasing its proportion in the national economy as a whole is a strategic measure for establshing a new pattern of economic development as well as a major reform in the development of the commodity economy. To develop the tertiary industry, we should start from various fields: 1) Speed up the development of undertakings concerning science, education, culture, public health and physical education to meet the need to improve the scientific and cultural levels of the whole nation and to meet the people's need for cultural consumption; 2) speed up the development of information, consulting, financial and insurance services and services rendered before and after the production process to meet the need to develop the commodity economy and promote the modernization program; 3) speed up the development of commercial, catering and repair services and public utilities to meet the need to invigorate urban and rural markets and provide convenience in people's daily lives; 4) speed up the development of foreign trade and tourism to meet the need to open up still further to the outside world. We can foresee that once these industries and undertakings are well developed, the tertiary industry will reach a new level and the whole economic outlook will be in for a drastic change.

Policies and Measures of Further Readjusting the Industrial Structure

Further readjusting the industrial structure according to the abovementioned orientation is a fundamental strategic change in the pattern of China's economic construction. To achieve this change, we should adopt a series of major policies and measures in addition to straightening out our guiding ideology.

Readjusting investment arrangements is the most important means of further readjusting the industrial structure. Investment arrangements and the industrial lineup are interrelated and mutually constraining. The readjustment orientation of investment arrangements should be in line with that of the industrial structure whereas changes in investment arrangements have a decisive bearing on those in industrial structure. During the economic readjustment in the early 1960's and the past few years, China relied to a great extent on the readjustment of investment arrangements to correct the imbalance in the industrial structure. Through the readjustment of the past few years, investment arrangements have improved substantially, but it still has many irrational factors and cannot meet the demands of the developing situation. As far as the fixed-asset investment of the whole society is concerned, the biggest existing problem is that the weak links of the national economy and departments urgently needed to be developed lack construction funds while large amounts of funds are funneled to general construction projects and unnecessary redundant construction projects. If this situation remains unchanged, further rational readjustment of the industrial structure will encounter extremely serious difficulties. When studying the distribution of investment, we always witness such a phenomenon, that is: many departments demand that they maintain their original ratio of investment and mistake it for seeking a proportionate development. This way of thinking is improper. In fact, only by throwing away the original irrational ratio of investment and carrying out necessary readjustment according to the objective demand of the law of economic development can we really bring about a proportionate development. Because of this, during the "Seventh 5-year Plan" we must increase investment necessary for energy, transportation, communications, raw and semifinished materials and other infrastructure facilities and for the construction of basic industries. At the same time, we should properly increase investment in agriculture, the consumer goods industry and the tertiary industry to help speed up the development of these departments and ensure smooth progress for the further readjustment of the industrial structure.

Implementing correct economic policies is an effective guarantee for further readjusting industrial structure. In the readjustment of the industrial structure, we should voluntarily exercise the regulatory function of economic levers and policies. Through the means of prices, taxes, credit and state subsidies, we should encourage and support those industries and products which need to be developed rapidly and restrict the development of those production and construction projects which are not urgently needed or which are in excessive supply in society. For instance, we should, under the guidance of state plan, expand the scope of market regulation for agricultural production, further decontrol and readjust prices for farm and sideline products and accelerate the rationalization of rural industrial structure and the development of the commodity economy. In order to change the phenomenon of low energy prices, we should properly increase the prices of energy resources and gradually establish a rational energy pricing system so as to encourage the increase of energy output and the conservation of energy. For another instance, in order to speed up the development of the consumer goods industry, we should continue to give it priority in the use of foreign exchange, the supply of energy and raw and semifinished materials and transportation conditions. All economic policies and levers should be coordinated and applied in a comprehensive manner to avoid "negative regulation" so that economic policies can genuinely exercise their power in the readjustment of industrial structure.

Vigorously promoting the reform of economic system is an enormous driving force for the further readjustment of the industrial structure. The irrationality of the previous industrial structure has a lot to do with the overcentralized and stifling control of the economic management system. For instance, over a long period of time, energy and communications facilities were managed by the central government alone and used by the whole country. This situation encouraged the phenomenon of eating from the "communal pot" and dampened the enthusiasm of all fields for energy and communications construction. For still another instance, state operations were overemphasized for a long time in the development of the tertiary industry, resulting in the uniformity of ownerhsip system. From now on, we should implement the principle of allowing the central government, departments, local units, enterprises and individuals to join efforts in the development of energy, raw and semifinished materials, transportation and communications undertakings and the tertiary industry. Except for those major back-bone projects and infrastructure facilities which should be undertaken by the central government, all engineering projects should be allowed to be undertaken by local units, enterprises and individuals. At the same time, we should break the barriers between different departments, trades and regions and give full play to the enthusiasm of all sectors. We should develop various sectors of the economy and different forms of management under the prerequisite that socialist public ownership occupy the dominant position. The tertiary industry which serves the people's daily lives, in particular, should vigorously develop collective and individual economies. Except for wholesale stores and large- and medium-sized retail stores, existing state-run commercial units may be changed step-by-step to collective operations and some small stores may be contracted, rented or leased to individuals.

Further readjusting the industrial structure from a more profound and extensive angle is a complex project affecting the economy as a whole. We should, according to the objective demands of economic development, make positive and farsighted plans for the readjustment of industrial structure and, according to the possibility of national strength and the conditions of local resources, determine appropriate procedures so as to ensure that the readjustment of the industrial structure will progress in an orderly and efficient manner.

JOURNAL DISCUSSES ENTERPRISE CONTRACT SYSTEM

HK290955 Beijing JINGJI GUANLI in Chinese No 3, 5 Mar 86 pp 6-10

[Article by Zhou Guanwu [0719 0385 0064]: "On the Contract System"--edited by Huang Weilin [7806 0251 2651]]

[Text] The contract system is a new thing that has appeared in the reform of our country's economic structure. It is like a newly-emerging force, attracting exceptional attention. The rural system of contracted responsibilities with payment linked to output has basically changed the impoverished and backward appearance of the rural villages in our country. In the cities, the economic contract responsibility system has also begun to show its immense power. The Shoudu Steel Company was the first enterprise in the whole country to enforce the contract system. For 7 years in succession, its realized profits have averaged an annual progressive increase of 20 percent and the momentum of the increase is continuing. The consensus of opinion is: "contracting is an overall cure." To contract or not makes a great difference in the enthusiasm of the enterprise and its staff members and workers. Why is this? This article will take up certain theoretical discussions thereon.

The Contract System Is a Good Form of Realization of the System of Ownership by the Whole People

Seen from the history of the social development of mankind, since the inception of the system of social division of work and private ownership, the responsibility system has come into being. Owners are the ones who have the responsibilities; owners with no responsibilities do not exist. Under the system of individual labor, the laborer is the owner and the responsible person; hence the enthusiasm for labor is high. Under the capitalist private ownership system, the workers are no longer the owners. For this reason, the capitalists have set up in their factories a strict responsibility system according to division of work. But this responsibility system is separated from the ownership system and therefore the workers do not have any enthusiasm for labor. The capitalists first resorted to very stern control tactics, that is, "hunger discipline," to compel the workers to carry out their duties and functions. As a result, class conflict became all the more intensified. Subsequently, they tried to do something by unifying the owners and the responsibility bearers. For example, [word indistinct] are encouraged to borrow funds to buy shares, become shareholders and earn dividends. In other words, an attempt is made to make the worker entertain the notion of being masters. Naturally, the attempt is futile, because it cannot solve the capitalist's basic contradiction between the private ownership of the means of production and the social character of production.

Establishment of the socialist system eliminates class antithesis, and should therefore restore the unity of the worker and the owner. But this unification is not built on the basis of petty production and private ownership but on the basis of a large-scale production and private ownership system. On the one hand, large-scale production requires a strict responsibility system; on the other hand, this responsibility system must be manifested in the workers holding the status of owners of the means of production under the public ownership system. Under the conditions of the socialist public ownership system, unification of the owners and the responsibility holders is a far more difficult and complex problem than the abolition of the private ownership system. Enterprises under the socialist public ownership system should be owned by the whole people with the whole people bearing the responsibilities. However, speaking of each and every enterprise, it is impossible for a billion people to jointly run it or be jointly responsible for it. Hence, in the past, we adopted the form of the system of ownership by the state, letting the state organs represent the whole people to directly operate and manage the whole-people enterprises. The consequences were: 1) Regardless of the size of the state organs, they were unable to summarily and directly operate and manage the thousands and tens of thousands of enterprises, frequently ending with a superstitious faith in power and in administrative tactics, with nobody bearing any responsibility for bureaucractism and blind direction; and 2) following the unified operation by the state, enterprises could not become economic entities and the enterprises and staff members and workers could not be responsible for the whole people. Thus, it naturally happened that though owned by the whole people, the whole people were not responsible and did not become the real owners, that the ownership system was separated from the responsibility system, and that the system of ownership by the whole people has not been truly realized.

The strength of the contract system lies in its ability, under the conditions of the socialist public ownership system, to unify the ownership system and the responsibility system, and to achieve the objectives of ownership by the whole people and responsibility by the whole people. According to the viewpoints of Marxism, the ownership system is not an isolated relationship but is manifested through the various links or stages of production, exchange, distribution and consumption. The belief that once the means of production are owned by the state, the system of ownership by the whole people has been realized obviously cannot stand. The various links of production, exchange, distribution and consumption all take the enterprise as the starting point and are mainly carried out between the enterprises. Moreover, the worker class, congregated in the enterprises, constitutes the principal element of the system of ownership by the whole people, being both workers and owners; means of production as objective factors of the system of ownership by the whole people also exist in the enterprises. Hence, the nature of the system of ownership of the means of production by the whole people should be manifested in the enterprises and not in the state organs located far away from the material production areas. This requires that by means of the contract system each and every enterprise owned by the whole people should become responsible to the whole people, that in the enterprises the whole-people ownership system and the responsibility system be unified, and that the system of ownership by the whole people be truly realized. If the system of ownership by the whole people and the responsibility system are not unified in the enterprises, then the enterprises may not be responsible for creating wealth for the whole people. In such a case, what is left of the system of ownership by the whole people is only significant in the science of law and economically of no actual value.

Reform of the economic structure begins with enlarging the decisionmaking power of the enterprises and this brings up the question of how to unify the enterprise to bear the responsibilities to society in the capacity of commodity producers. The enterprise not only contracts for delivery of profits and taxes to the state but also, in respect of the material wealth belonging to whole people but kept in its possession, contracts for the increase in value, improvement in benefits and development in production. For its part, the enterprise must continuously seek increasing interests for society before it can correspondingly increase its interests. Conversely if the enterprises does not bear responsibilities to society, then it will not have any interests of its own. Thus, on the basis of the principle of material interests, the system of ownership by the whole people and the responsibility system are united.

Under the conditions of a socialist commodity economy, it is necessary to carry out distribution according to work. Under the conditions of a commodity economy, the labor of the workers is not directly manifested as social labor. It can only be recognized by society through being the concrete labor of enterprise workers, who turn out products and subsequently pass through the process of commodity exchange.

Enforcing the contract system provides an enterprise with the possibility of making maximum efforts to create more and to retain more. On this basis, the income of the staff members and workers is linked to the benefits of the enterprise. Following this, through contracting level by level inside the enterprise down to the individual, distribution according to work is carried out according to each and every staff member's or worker's contributions to the gross benefits of the entity. This naturally will encourage the broad masses of staff members and workers to labor to the fullest capacity. By so doing, the members and workers of an enterprise, simultaneously with taking up the responsibilities of masters of the house can also earn the master's benefits, and, through the practice of distribution according to work the owners and persons bearing the responsibilities are united.

Summing up the above, at the current stage of socialism, it is necessary to insist on the system of ownership by the whole people as the principal factor and to greatly develop commodity economy. At the same time, we must seriously carry out distribution according to work. How to handle these tri-party relations well is a problem that must be solved in reforming the economic structure. Enforcing the contract system can join together the system of ownership by the whole people and the responsibility system, enabling the enterprise, in the capacity of a commodity producer, to take up the responsibility to the whole people, enforce distribution according to work on the basis of the large or small contributions made by the enterprise's staff members and workers to the whole people, and enable the socialist system of ownership by the whole people to display in full its superiorities.

The Contract System Is a New Development of the Responsibility System

The contract system enforced by the enterprises has two aspects. One is that the enterprise contracts the responsibility to the whole people; the other is that under the precondition of contracting by the enterprise itself, inside the enterprise a contract responsibility system is also in operation involving the various specialized departments layer by layer down to the individual worker. This in effect realizes the integration of the system of ownership by the whole people and the responsibility system. This is a new type of responsibility system and represents contracting to the whole people through the enterprise's staff members and workers being organized in coordinated labor. It is on the one hand the realization of the system of ownership by the whole people and is also a requirement for division of work and cooperation in large-scale production. This type of contract system which is related to the socialist system of ownership by the whole people is a new development of the responsibility system. It makes each and every staff member and worker an owner and also one who bears the responsibilities, truly the master of society and the enterprise. In content and form, this type of contract system shows clearly the following special features:

First, it must include contracting for the annual growth of the economic benefits. The responsibilities borne by enterprises under the system of ownership by the whole people are centrally manifested, on the basis of growth in the output volume, quality improvement and expansion of varieties, in the continuous growth of realized profits. Enterprises owned by the whole people carry out production by possessing and using the means of production of the whole people. Since the production process is the process of increasing the value of capital funds, naturally the enterprise must bear the social responsibility for the increment in value of the capital funds and if there is no value-increment in capital funds then the enterprise has not performed its duty.

Here, a precondition must be mentioned, that in regard to the distribution of benefits between the enterprises and the state and the enterprise's delivery tasks to the treasury, first the contracting must be air-tight and, second, it must envisage progressive increases year by year, the enterprise being allowed to retain more in the event of a larger surplus, to make accumulations by itself, and to use the accumulations for purposes of self-transformation and self-development. By so doing, the enterprise will not confine its efforts to barely fulfilling the delivery tasks to the treasury but will do its best to increase the surplus so as to retain more, to step up the value-increment of the funds, and to fulfill its responsibilities to society. For example, the Shoudu steel plant, after contracting for an annual progressive increase of 7.2 percent in delivery of profits to the state, used the 398 million yuan of surplus retention funds from surplus profits to undertake the technological transformation of 74 major projects and obtained 764 million yuan of benefits. For 7 years in succession, its realized profits have averaged an annual progressive increase of 20 percent. The realized profits in 1985 were equal to 312 percent of those in 1978 before the reform. If profit deliveries to the state are not contracted for in an air-tight manner and do not increase progressively each year and if the enterprise's funds must be delivered to the state at a fixed radio regardless of the extent of their increment, then little can be retained by the enterprise no matter how much profit it has earned and it will be lacking in motive force. On the other hand, it may not suffer much loss on account of not having created much but in such a case the force of pressure will be lacking. In neither case will the enterprise be able to achieve a sustained growth in economic benefits.

Second, the contents of the contract must be comprehensive. Enterprises of the whole people must bear an overall responsibility for the interests of the whole people. Hence, in the contents of the contract, in addition to providing for increasing the value of the funds, it must include contracting for the following: output quantity and quality of the products must be suited to society's daily increasing needs; the resources must be fully and rationally utilized; environmental pollution must be effectively removed; the quality of the material and cultural lives of its contingent of staff members and workers must be continuously improved, and so on and so forth. These contents of the contract must be fully implemented by means of an internal contract system in the enterprise. The targets contracted for internally in the enterprise must form an integrated structure, because the relationships between the various production, technological, and economic targets criss-cross with each other and are exceedingly complex and full of contradictions. In making the plan for the contract-guarantee-audit structure, it is necessary to consider and comprehend all sides, weigh the advantages and disadvantages, and unify the contradictions with due consideration for the total benefits of the enterprise. It is true that contracting for single or unilateral targets and giving prominence to one or two targets may attain quicker results, but this may frequently damage overall benefits. In reality, this has not contracted for the responsibilities in their entirety. Some targets possess social benefits and environmental benefits but not necessarily economic benefits to the enterprise, such as treatment of dust and noise, purification of po-luted water and the rotating utilization of water, comprehensive use of waste materials, treatment of harmful gases, and so forth. In handling them, the enterprise may expend a great deal of effort but can obtain little or even negative benefits. Nevertheless, they must be provided for in the contract, since only by so doing can the enterprise be said to have been truly responsible to the whole people. Following an enterprise's enforcement of the contract system, improvement of the material and cultural lives of the staff members and workers, instead of being contracted for by the state as in the past, will be completely dependent on the staff members' and workers' own creative efforts. By so doing, the development of production and improvement of living are organically integrated, making contracting for the improved living of the staff members and workers become the material motive force for developing production.

Third, the contract targets must manifest the integration of targets for the recent period with long-range development. Since the reform, the enterprises have shown a more or less universal tendency of caring for interests of the recent period and overlooking long-range development. This is extremely harmful to economic construction. The cause does not lie in the enterprises themselves, in that without being allowed to do the contracting, the enterprises have no way to bear the responsibilities of a long-range development vis-a-vis the whole people. Since the contract system provides for an annual increment in the value of the capital funds and also for all-round responsibilities to the whole people, it will make the enterprises combine the interests for the recent period with long-range development and plan for their own future. In reality, the realization of the near-term targets is frequently inseparable from the past long-term efforts. In particular, certain important transformation measures, from their beginning to entering into production, must pass through a definite sequence. Without a long-term plan, the economic benefits of an enterprise cannot achieve a sustained development and growth. Hence, level-by-level contracting inside an enterprise must include, on the one hand, contracting for the fighting targets for the current year and, on the other hand, the work to be done during the year for the realization of the long-range targets. Only by so doing will it be possible to make the staff members and workers perceive their own favorable prospects in their enterprises' long-range development, thereby stimulating them, at their respective posts, to display their hard-fighting labor enthusiasm in implementing the long-range plans.

Fourth, the contract must not be confined to the economic and technological targets alone but must also include business management. Any economic and technological target, from its compilation, execution, and inspection to eventual checking and assessment, is inseparable from the protection and assurances of business management. If there is only contracting for targets but no contracting for business management, the targets can hardly be realized. The contents of the contracting for business management include, for each and every business project, its standards, responsibility, procedure, cooperation and checking and assessment. Moreover, these contents must be continuous and must advance with the continuous growth of the enterprises' benefits. In the case of the Shoudu Steel Plant, its management modernization program started with the establishment of a contract system for specialized management and each and every specialized management project must be contracted for in accordance with the requirements for "comprehensiveness" (overall), "altitude" (high standard), "timeliness" (time limit), "cooperation" (cooperating in work) and "assessment" (checking). This is subsequently followed up, through adherence to the prescribed procedure of the contract system for specialized management, by planning of a large amount of management software so as to facilitate the swift development of the use of the computer in management, thus initiatively setting up a computerized management network.

Fifth, the staff members and workers in their entirety constitute the main body of the contract. Socialist construction is an enterprise belonging to the millions of people themselves. Contracting by an enterprise is tantamount to all the staff members and workers of the enterprise, in their capacity of collective masters, contracting for the functions that must be performed and the responsibilities that must be borne to society and to the whole people. We must not confuse the contract system of an enterprise with the contract system involving only the plant director as an individual. The staff members and workers of an enterprise run the enterprise and the enterprise is not run by the plant director alone. All the staff members and workers are unanimous in responsibility, obligations, targets and interests and the plant director is only one of the staff members. It is not proper for the plant director to take sole charge of a contract. The contract system enforced by the Shoudu Steel

Plant is precisely a contract by the entire group of staff members and workers and the basic method adopted is, through contracting, ensuring and assessing, to organize scientifically and effectively the initiative and creativeness of the entire body of staff members and workers as masters of the house, thus jointly realizing contracting to the whole people.

In the final analysis, the above-mentioned special features of the contract system are the unification, according to the principle of the integration of current and long-range interests, of the interests of the three parties, namely, the state, the enterprise, and the staff members and workers. A contract system of this type embodies an internal mechanism which is full of vitality. In the case of the Shoudu Steel Plant, it is principally reflected in certain quantitative relationships as follows: profit-delivery to the state progressively increasing by 7.2 percent a year; realized profits progressively increasing by 20 percent a year; distribution and utilization of the production development fund, collective welfare fund and wages, award and commendation fund at the ratio of "6-2-2"; and the gross amount of staff salaries and wages being linked to the realized profits and floating at the ratio of 0.8 to 1. Within this series of figures a close relationship and a dialectical relationship of reciprocal promotion and reciprocal restriction exist. For example, only when contracting is air-tight and calling for an annual progressive increase of "7.2 percent" is there enthusiasm for a progressive growth of "20 percent"; only when there is this "20 percent" increase can the growth of "7.2 percent" be ensured and can there be corresponding increases in the three categories of funds at the ratio of "6-2-2"; only when 6-10ths of the retained profits are used on production development can there be assurance for maintaining the sustained and progressive rate of "20 percent"; and only when there are figures of "0.8 to 1" can the staff be made to vie with each other in making contributions to the growth of "20 percent." Naturally, these numbers are not fixed or unchangeable. Following the development of the enterprises, some of the figures must be readjusted but the internal mechanism formed by the reciprocal relationships between them will forever exist. It will enable the enterprises to go ahead at full power to actively create high benefits; it makes possible the reliance on technological transformation and technological progress to continuously create new benefits; and it integrates the enterprises' short-term interests with long-range development, thereby creating sustained high benefits. And the high benefits are the joint product of the whole body of staff members and workers, consciously and of their own accord.

All three parties, namely, the state, the enterprise, and the staff members and workers are confronted with the problem of how to do a good job in handling the relationship between current interests and long-range interests. If the job is not handled well by any one of the parties concerned, the internal mechanism of the contract system may be damaged or wrecked. If the state does not allow the enterprises to retain that portion in excess of the "7.2 percent," then the state may not be able to obtain the "7.2 percent" for long; indeed, if the state cares only for obtaining more for the present and taps the enterprises too depply and too hard, the long-range interests of the state will suffer losses. For their part, the enterprises should do a good job in handling the relationship between accumulation and consumption so as to maintain reserve strength for their development. If the number "6" is missing in the ratio "6-2-2," then the absolute amounts of the next two numbers of "2" and "2" will become increasingly smaller. So far as the staff members and workers are concerned, without the current interests and being unable to procure more for more work, they can hardly see the long-range interests ahead and there will be no way to arouse their labor enthusiasm; and without a planned target which can ensure maintenance of the long-range interests of the staff members and workers, their enthusiasm for labor cannot be sustained.

The contract system's internal mechanism which is full of vitality enables enterprise management to manifest, on the one hand, the objective demands of large-scale production, and, on the other, the essence and special features of socialist production relations. This generated enthusiasm of the workers in their capacity as masters of the house, through the scientific organization of the three basic methods of contracting, ensuring, and assessing, has organized in the enterprises each and every person, each and every piece of work, each and every business project and each and every type of activity to form an organic fighting force which will march forward with unanimity in thought, in direction, in action and in steps. This marks the essential difference between our socialist management of enterprises and the capitalist management of enterprises. It clearly shows wherein the superiority of the socialist system lies.

The Contract System Is the Basic System of Socialist Management

The socialist contract system is not only the basic method for organizing joint labor in socialized large-scale production but should also become the basic system of socialist management.

At present, if we wish to greatly develop socialist commodity economy, the central link is to invigorate the enterprises which are the producers of commodities. However, at the moment the great majority of the large and medium-sized enterprises under the system of ownership by the whole people have not been truly invigorated. Some comrades have expressed the fear that once the enterprises have been invigorated, they may one-sidely seek partial interests for themselves and disregard the interests of the whole. This is without any foundation. But without the invigoration of the large and medium-sized enterprises which are the backbone units, it will be greatly disadvantageous to the development of the national economy. How is it possible to make the large and medium-sized enterprises display the vitality of commodity producers and at the same time be responsible for the whole people? In my opinion, the contract system is the solution. It can solve the new problems encountered in the course of our reform of the economic structure.

After an enterprise has taken up a contract, as an independetn commodity producer, its responsibility to the whole people is not the former type of administrative responsibility it bore to the state organs but is truly an economic responsibility. In the past, enterprises were responsible only to the state organs in charge whereas the state organs could not, because of the ever-changing social demands, regulate the business operation activities of the thousands upon thousands of enterprises. This frequently resulted in the enterprises' production activities being out of joint with social needs and caused the enterprises to be truly unable to be responsible to the whole people. Following enforcement of the contract system, the economic responsibilities the enterprises bear to the whole people will be closely linked to the enterprises and to the intimate material interests of the staff members and workers themselves. This will naturally motivate the staff members to watch their own interests and make them actively interested in, and suited to, the social needs and, in accordance with the demands of coordinating and developing the national economy, shape their enterprises' policies, readjust the structure of the products and the direction of their investments, open up new production areas in pursuance of social needs, and continuously create more wealth for the state.

To truly accomplish the objectives of ownership by the whole people and being responsible to the whole people, we should not require the enterprise alone to contract with society and with the whole people. Rather, state organs at the upper levels should likewise contract with the whole people. State organs are the public servants of society and not its masters. We must avoid the idea that only the state organs can represent the whole people. State organs and enterprises are both parts of the whole people, except that there is a difference in the social division of work. We cannot conceive that enterprises constitute the part whereas state organs are the whole. As a matter of fact, state organs are also divided by departments and/or regions. The various departments of state organs should also be responsible to the whole people and contract for duties and functions in accordance with the assignments of the division of work. State organs should also enforce the contract system, bearing the economic responsibilities to the whole people, the enterprises, and society and realize the integration of power, responsibility, and benefit. This is an effective measure to prevent and overcome subjectivism, bureaucratism, and issuing commands blindly. It is also a great and important reform of the work of state organs. In the whole country, each and every unit, each and every department, each and every enterprise, and each and every individual should enforce contracting with the whole people and form a society-wide contracting structure. The contract system will thus become a basic system in socialist management.

In summing up the experiences of the Paris Communes, Marx and Engels conceived thus of future society: "Not only should this type of organization take as its basis the union of workers of each and every factory but also all these unions should form a big alliance" ("Collected Works of Marx and Engels," Vol 22, p 226). The relationship between these individual united bodies and between them and the big union is that of union. Under the conditions of a commodity economy, a union of this kind should not be realized by means of the state adopting administrative tactics of a compulsory nature but should be realized, through contracting, by means of the coexistence and regulated development of the interests of the three parties, namely, the state, collective and individual. By so doing, outwardly the state's power over the management and control of the economy may seem to have been curbed but, due to the state being diverted from the large volume of daily economic affairs and being able now to concentrate energy and efforts on dealing with the big and important issues of the whole situation, the leadership role of the upper layers of the structure over society as a whole will be greatly augmented. Therefore, on the foundation of continuously strengthening ideological and political work and under the conditions of a commodity economy, the formation in the whole society of a contract structure will be an experiment in, and promotion of, efforts to realize the concept of future society envisaged by the originators of Marxism.

PROVISIONAL REGULATIONS ON TAXATION PROMULGATED

OW041021 Beijing XINHUA Domestic Service in Chinese 0106 GMT 2 May 86

[Text] Beijing, 2 May (XINHUA)--Provisional Regulations on the Management of Taxation of the People's Republic of China (Promulgated by the State Council on 21 April 1986)

Chapter I. General Principles

Article 1. These regulations are formulated to ensure implementation of state decrees and policies on taxation, strengthen the management of taxation, guarantee the state's financial revenues, maximize the role of taxation as a leverage for regulating the economy, and promote reform of the economic system and coordinated development of the national economy.

Article 2. The collection of all types of tax under the auspices of tax authorities, with the exception of those specified elsewhere in the state law, should be administered according to the provisions in these regulations.

Units and individuals who are obliged to pay taxes (hereinafter referred to as taxpayers), and units and individuals who are obliged to collect, withhold, and pay taxes on another's behalf (hereinafter referred to as collecting agents), should follow the stipulations in the tax decrees and fulfill their obligations as taxpayers or as agents for collecting, withholding, and paying taxes.

Article 3. The collection and deduction of all taxes should be administered according to the provisions in the tax decrees and the system of management for taxation. No localities, departments, units or individuals are allowed to make decisions contradicting the stipulations in the existing tax decrees and taxation management system in any form.

Article 4. Any unit or individual has the right to report and expose activities violating tax decrees. Tax authorities should undertake to maintain the confidentiality of, and give rewards to, the informers in accordance with stipulations.

Article 5. Tax authorities are responsible for organizing efforts to implement these regulations.

Chapter II. Tax Registration

Article 6. Taxpayers engaged in production and business operation, who practice independent accounting, and whose operations have been approved by the administrative office of industry and commerce should, within 30 days after receiving their business licenses, report to the local tax authorities and go through tax registration.

All other units and individuals obliged to pay taxes, with the exception of those exempted from tax registration by the tax authorities, should report to the local tax authorities and go through tax registration within 30 days from the day they become legal taxpayers, as stipulated by tax decree.

Article 7. A taxpayer's branch office, which operates across several localities and does not practice independent accounting, should report to the tax authorities on where the office is located and go through registration within 30 days after its establishment.

Article 8. When going through tax registration, the taxpayer should submit a report for the application of registration, the pertinent approval documents, as well as other related certificates.

After examining and verifying the report, documents, and certificates mentioned in the preceding paragraph, the competent tax authorities will process registration and issue a tax registration certificate.

The tax registration certificate is limited to use by the taxpayer. It may not be loaned or transferred.

The following will be recorded during tax registration: Taxpayer's name and address, the form of ownership, the hierarchical relationship, the mode and scope of operation, as well as other related matters.

Article 9. After the taxpayer has completed tax registration, if it becomes necessary to modify tax registration because of transfer to other trades; reorganization; establishment of a branch office; mergers and joint operations with other businesses; relocation, suspension, or closing down of business; or bankruptcy, the taxpayer should report to the competent tax authorities and go through modification of registration, re-registration, or de-registration within 30 days after the day of approval or declaration by the departments concerned.

Article 10. Prior to going through modification of registration, re-registration, or de-registration, if the taxpayer has taxes to be settled or invoices to be turned in and cancelled as required by regulation, he should settle matters with the competent tax authorities, and turn in the invoices and related certificates issued by the tax authorities for cancellation.

Chapter III. Tax Assessment

Article 11. In accordance with the provisions stipulated in Article 6 of the provisional regulations, taxpayers applying for tax registration must apply for tax assessment with the competent authorities. According to specific conditions, the taxpayers must truthfully fill out the tax assessment forms regarding form of ownership, mode and scope of operation, titles, functions, and uses of products, as well as receipts, income, and other taxable items.

Article 12. The competent tax authorities must examine the taxpayers' tax assessment forms according to law, determine the appropriate tax categories, tax items, tax rates (or per-unit tax amount), taxation links, the basis for tax computation, the time limit for tax payment, and the mode of collection, and issue tax assessment certificates accordingly.

Article 13. The competent tax authorities must issue the collecting agents, according to law, vouchers to collect, withhold, and pay taxes. The vouchers should clearly state the appropriate tax categories, tax items, tax rates, the time limit for payment, and the mode of payment.

Article 14. In case of changes in the tax assessment items, the taxpayers must apply for modification of the tax assessment forms with the competent tax authorities within 15 days starting from end date of change.

The taxpayers must submit samples of new products, along with product appraisal forms, to the competent tax authorities for tax assessment. The samples shall be returned to the taxpayers after completion of tax assessment. In case of difficulties in delivering the product samples to the tax authorities for assessment, the taxpayers must apply for assessment in the factory.

Article 15. Upon promulgation of new tax regulations, or revision of old tax regulations by the state, the competent tax authorities must notify the taxpayers and collecting agents to follow accordingly, and revise the tax assessment certificates and vouchers for the collection, withholding and payment of taxes.

Chapter IV. Filing of Tax Returns

Article 16. In accordance with relevant provisions governing the filing of tax returns, the taxpayers must submit tax returns, financial and accounting reports, and pertinent tax information to the competent tax authorities. The collecting agents must go through the filing procedures for the collection, withholding, and payment of taxes in accordance with relevant positions.

The tax authorities shall decide on the time for the filing of tax returns by the taxpayers and the time for the collection, withholding, and payment of taxes by the collecting agents in accordance with the tax decrees and the specific conditions of the taxpayers and the collecting agents.

Article 17. In case of failure to submit tax returns within the prescribed time limit owing to special circumstances, the taxpayers should report to the competent tax authorities, and the filing of tax returns may be appropriately extended. In light of the circumstances, the competent tax authorities may make a provisional appraisal of the taxable amount in advance, and notify the taxpayers to make advance tax payments, pending final settlement of accounts upon filing of tax returns.

In case of failure to collect, withhold, or pay taxes within the prescribed time limit owing to special circumstances, the collecting agents should report to the competent tax authorities, and the collection, withholding, and payment of taxes may be appropriately extended.

Article 18. In case of failure by the taxpayers to submit tax returns to the authorities 30 days beyond tax payment obligations or 15 days beyond the time limit prescribed by the tax authorities are empowered to decide on the taxable amount and prescribe a time limit for payment.

The final day of the time limit for filing tax returns and that for tax payment may be extended if it falls on an official holiday or other holidays.

Article 19. To apply for tax reduction or exemption, the taxpayers must submit a written report to the competent tax authorities. Prior to approval of application for tax reduction or exemption, taxpayers must pay taxes in accordance with the regulations.

Chapter V. Collection of Taxes

Article 20. The method of tax collection is specified by the tax authorities in accordance with the tax laws, and by taking into consideraton the taxpayers' production and business operations, and their level of financial management. The method used should make tax-collecting a readily manageable job. Among the major methods are: Tax collection based on audits, inspections, and verifications; collecting taxes in fixed amounts at regular intervals; and collecting, withholding, and paying taxes on another's behalf.

Article 21. The management of tax collection may take the following forms: stationing tax personnel in factories or in different trades and areas to oversee the work; or assigning a roving group for this purpose. The tax authorities will specify the methods of managing tax collection. The taxpayer's supervisory organs, as well as the trade and neighborhood organizations to which he belongs should coordinate their efforts and help the tax authorities properly manage the work of tax collection.

Article 22. Collecting agents should fulfill their obligation in collecting, withholding, and paying taxes on another's behalf, and go through the respective procedures in accordance with the provisions of the tax laws, as well as the rules specified in the certificates for collecting agents. The tax authorities should pay a service charge to collecting agents as required by regulations.

Article 23. The tax authorities have the right to inspect, verify, and register the taxpayer's goods and taxable properties.

Article 24. The competent tax authorities may require taxpayers engaged in temporary business operations to assign a guarantor for tax purposes or to prepay the pleged money for similar purposes. They may set a time limit for settling tax payments. If the taxes are not settled within the time limit, the guarantor will be responsible for paying the taxes, or the pledge will be used to pay the taxes.

The competent tax authorities should write a receipt when receiving, in advance, the pledge in lieu of tax payment.

Article 25. A taxpayer overpaying his taxes may submit a refund request to the original tax-collecting organ within a year after the overpayment day. The overpaid portion will be refunded after the tax authorities at or above county level given their approval. The tax authorities will not handle requests made beyond the time limit.

Chapter VI. Management of Accounts, Invoices, and Certificates

Article 26. In accordance with the state's financial and accounting decrees, as well as the stipulations of the tax authorities, taxpayers should establish a sound financial and accounting system, assign personnel to handle tax payments, and maintain a complete account book, vouchers, payment records, tax payment receipts, and other tax-related documents. Individual taxpayers truly incapable of establishing account books may request the permission of the tax authorities at and above county level to temporarily put off the establishment of account books. However, they must maintain a complete set of tax-related documents such as invoices, payment records, and tax payment receipts. Collecting agents should set up special accounts as stipulated, and take good care of the records of taxes which they collect, withhold, and pay on another's behalf.

The competent tax authorities should be immediately notified if the records mentioned in the preceding paragraph are lost.

Article 27. A duplicate of the financial and accounting rules formulated by the supervisory organ of the taxpayer for their department should be delivered to the tax authorities at the corresponding level. The financial and accounting rules of the taxpayer and the method of handling his specific finance and accounts should not contradict the tax laws. If such contradiction occurs, the tax laws should be observed.

Article 28. Invoices will be managed by the tax authorities in a unified manner. Without the approval of the tax authorities at and above county level, no units or individuals are allowed to print, sell, or undertake to print invoices.

With the exception of special vouchers certified by the tax authorities, all invoices should be printed with the invoice supervision stamp of the tax authorities at and above county level.

Article 29. Taxpayers and collecting agents should preserve and use the invoices as stipulated by the tax authorities.

Article 30. The tax authorities should establish archives of tax collection for taxpayers on a household basis, take good care of these records, and make them strictly confidential.

Chapter VII. Tax Investigation

Article 31. Taxpayers and collecting agents are subjected to tax organs' supervision and inspection. They must report the situation factually and provide the relevant information and must not hold back facts, or obstruct inspection, or create difficulties for it.

Before conducting a tax investigation, a tax collector must show his tax inspection card.

Article 32. According to needs and with the approval of a provincial-level people's government, tax organs may set up joint investigation stations (units) at terminals, piers, and airports as well as other vital communications junctions with other relevant departments to check tax payment. Where there are no joint investigation stations (units), they may also operate tax investigation stations (units) singularly if it is absolutely necessary. Business administrative, public security, communications, railway, civil aviation, postal and telecommunications, and banking departments should provide them assistance.

Article 33. When a taxpayer goes to another part of the country to engage in production, operate a business, or provide personal labor service, he must bring with him the proof of tax payment issued to him by his original tax organ and register at the tax organ of the new location and receive its tax investigation.

Article 34. When a permanent business operates in an urban or country fair, it should display its tax records, or other relevant documents issued by a tax organ.

Chapter VIII. Handling of Violations

Article 35. In handling violations, tax organs must create files for all cases, verify the facts, and handle the cases according to law. They should also give written notifications to the parties concerned on how their cases are handled.

Article 36. If a taxpayer violates one of the following, in addition to being ordered to take remedial measures within a time limit, he may also be fined up to 5,000 yuan considering the circumstances:

1. Failing to make tax registration, or to register tax payment, or use his tax registration records according to regulations;

2. Failing to have his tax payments assessed according to regulations;

3. Failing to report his taxes according to regulations;

4. Failing to establish an account, or use and keep his tax payment documents.

5. Failing to provide information on tax payment according to regulations; or

6. Refusing to accept tax organs' supervision and inspection.

Article 37. Tax error, delinquency, evasion, and refusal to pay taxes shall be handled according to regulations outlined below:

1. Tax error: This refers to a taxpayer's unintentional failure to pay taxes, or pay the full amount of taxes. One who makes a tax error shall be notified by the tax organ to pay up the difference according to regulations within a time limit. If he fails to do so, an additional 0.5 percent surcharge will be imposed on the unpaid amount of taxes each day, beginning from the day the tax error is made.

2. Tax delinquency: This refers to failure of a taxpayer who, for some reason, fails to pay taxes, or the full amount of taxes, within the time limit set by the tax organ. The tax organ, in addition to ordering the tax defaulter to pay up the unpaid amount according to regulations within a time limit, will also imposed a 0.5 percent daily surcharge on the unpaid amount, beginning from the day of the delinquency.

3. Tax evasion: This refers to the conduct of a taxpayer who evades paying taxes by fraud and concealing facts. In addition to ordering the tax evader to pay the amount of the evaded taxes according to regulations within a time limit, the tax organ will also fine him up to five times the amount of the evaded taxes. The person directly responsible for the tax evasion and one who instigates, incites, or abets tax evasion may be fined up to 1,000 yuan.

4. Refusal to pay taxes: This refers to the conduct of a taxpayer who refuses to fulfill his obligations to pay taxes according to the tax law. In addition to ordering the one who refuses to pay taxes to pay the amount of unpaid taxes according to regulations within a time limit as well as imposing a fine on him five times that of the amount of unpaid taxes, the tax organ may, in accordance with the taxpayer's actual situation, impose on him an additional fine of up to 50,000 yuan. A fine of up to 1,000 yuan may also be imposed on whoever is directly responsible for the refusal and on those who instigate, cover up, or support the refusal.

Article 38. When a taxpayer fails to respond to notifications for him to pay his unpaid taxes, delinquency surcharge, and fines, the tax organ may adopt the following measures as it sees fit:

1. Officially notify his bank to deduct the amount from his account, and transfer the amount to the state treasury.

2. Revoke his tax registration and stop issuing tax payment documents to him until he pays up.

3. Request the business administrative departments to revoke his business license and suspend his operation until he pays up.

4. Request the people's court to enforce payment when the three measures mentioned above are ineffective.

Article 39. When a collecting agent violates Articles 16, 17, 22, 26, 29, and 31, he should be handled according to the regulations prescribed in Articles 36, 37 and 38 of this chapter.

Article 40. When taxpayers, collecting agents, and other parties concerned have a dispute with a tax organ over tax payment or the handling of tax violations, they should, first of all, pay the tax, delinquency surcharge, and fines according to the tax organ's decision; adn then, within a 10-day period, request a higher tax organ to reexamine the case. The higher tax organ should make a reply within 30 days after receiving the petitioner's request. Should the petitioner disagree with the reply, he may prosecute the case at the people's court within 30 days after receiving the reply.

Article 41. When a taxpayer's tax violation constitutes a crime, the tax organ should request the judicial organ to have his criminal responsibilities investigated.

Chapter IX. Supplementary Articles

Article 42. These regulations are not applicable to the income taxes of Sino-foreign joint ventures and foreign-owned enterprises, personal income tax, custom duties, and the collection and management of agricultural taxes.

Article 43. The Ministry of Finance shall be responsible for interpreting these regulations; and the people's governments of all provinces, autonomous regions, and municipalities directly under the central government shall draw up their implementation measures on the basis of these regulations.

Article 44. These regulations become effective on 1 July 1986.

PROGRESS OF XINJIANG'S FINANCIAL UNDERTAKINGS REVIEWED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 12, 4 Dec 85 pp 56-57

[Article by the Xinjiang Uygur Autonomous Region Branch of the People's Bank of China: "The Advancing Financial Undertakings of Xinjiang"]

[Text] This year is the 30th anniversary of the founding of Xinjiang Uygur Autonomous Region. In the past 30 years, in accordance with the party's policy of regional national autonomy, Xinjiang's financial undertakings have made great achievements in stopping inflation during the early period of the founding of the PRC, unifying monetary systems, stabilizing prices on the basis of accelerating national economic recovery and development, supporting socialist transformation, promoting national economic readjustment and developing the socialist economic construction of the autonomous region. Especially since the 3d Plenum of the 11th CPC Central Committee, Xinjiang's financial undertakings have made fresh developments.

Great Achievements

By the end of 1984, Xinjiang had established 1,542 banking organizations at all levels and 818 rural credit cooperatives with 19,568 staff and workers. In the past 30 years, under the correct leadership of party committees and government organs at all levels, all staff members and workers of banking organizations and credit cooperatives have worked hard and made contributions to developing Xinjiang's financial undertakings.

1. They have vigorously organized deposits to pool large amounts of production funds for developing the economic construction of the autonomous region. At the end of 1984, the balance of all deposits reached 8.39 billion yuan, an increase of 27-fold over 1955, of which, savings deposits increased fortyfold pooling large amounts of production funds for Xinjiang's economic development. The people's savings deposits of Xinjiang accounted for 33 percent of all deposits.

2. They have vigorously issued rural and animal husbandry loans to support agricultural and animal husbandry production and the development of the commodity economy in rural and pastoral areas. In the past few years, along with the development of the reform of the rural economic structure, banks and credit cooperatives have changed from simply supporting agricultural and

animal husbandry production to supporting major projects of agriculture, forestry, animal husbandry, sideline production, fishing, industry, commerce, transport, service and various other industries as well as the all-around development of township enterprises. By the end of 1984, the balance of various agricultural and animal husbandry loans issued by all banks and credit cooperatives in Xinjiang reached 870 billion yuan, an increase of 22-fold over 1955.

3. They have strengthened control over circulating funds and accelerated the development of industrial production and the continuous expansion of commodity circulation. In the past 30 years, industrial loans issued by various banks in Xinjiang have increased 28.3-fold and commercial loans, 7.3-fold. Since the 3d Plenum of the 11th CPC Central Committee, they have further increased loans to the collective and individual sectors of the economy and promoted the development of the tertiary industry. In the past few years, banks have implemented the principle of "dealing with each case on its merits and supporting those whith outstanding qualities" in credit work, and strengthened the function of the interest lever. In accordance with the decision of the State Council, they have also put the circulating funds of state-run enterprises under the unified control of banks and thereby effectively promoted the rational use of enterprises' circulating funds, speeded up capital turnover and improved administration and management.

4. They began in 1979 to issue loans for fixed assets to promote the development and construction of the autonomous region and the technological progress of enterprises. By the end of 1984, the balance of various fixed-asset loans issued by banks had reached 56.089 million yuan.

5. They have adapted to the policy of opening to the outside world and expanded international financial business. The Urumqi Branch of the Bank of China was established after the 3d Plenum of the 11th CPC Central Committee. In addition to handling deposits, loans and account settlements in foreign currencies and renminbi, this branch has also dealt with international trust businesses and established representative business relations with 374 banks and their branches in 72 countries and areas. Comparing 1984 with 1980, its foreign exchange earnings increased 6.24-fold, its foreign trade loans, 3-fold and its foreign exchange loans, 1.68-fold.

6. They have reformed the control system of capital construction investment and increased economic results. In the past 30 years, construction banks in Xinjiang have provided 21.54 billion yuan in capital construction funds in the forms of appropriations, loans and commissions, which helped build 17,948 investment projects and added 14.64 billion yuan of fixed assets.

7. They have developed insurance business and established an economic compensation system. At present as many as 23 kinds of domestic insurance are available in the region and the total value of insured properties has reached 3.99 billion yuan. Also available are four kinds of foreign insurance. This has ensured the stability of society and the people's living standards and reduced the financial burden on the state.

8. They have stabilized currency and commodity prices and created a good economic environment for Xinjiang's economic construction. They have, on the one hand, supplied currency for continuously expanding commodity production and circulation and, on the other hand, used credit to vigorously support commercial departments in expanding the market supply of readily marketable commodities, organized savings deposits in urban areas and towns, strengthened cash control and organized the withdrawal of currency from circulation. They have also conducted on a regular basis, typical investigations of the currency circulation situation on the market. Since the founding of the autonomous region, Xinjiang's currency circulation has been basically normal and its market prices stable.

9. They have reformed the banking system and established a new socialist financial system with the Bank of China as its core and various specialized banks and insurance companies as its main body.

10. They have trained many minority cadres to take care of financial work, established a contingent of financial experts to serve the masses and, in particular, trained a group of minority financial cadres who have special knowledge in finance and the ability to establish close relations with the masses. At present, 34 percent of Xinjiang's financial workers and 32.8 percent of leading cadres at and above the level of county branches are minorities.

Useful Experience

In the past 30 years we have gained the following experiences in financial work:

1. We must deeply understand the position and function of banks in the national economy. Banks are an important sector of the national economy. They accelerate national economic development by giving full play to the functions of economic levers. There have been three periods in the past 30 years in which the functions of economic levers were put to better use: 1) The period of socialist transformation, which helped establish the socialist ownership system in the autonomous region; 2) the economic readjustment period of the 1960's; and 3) the new period between the 3d Plenum of the 11th CPC Central Committee and now. The main reason why the functions of banks were put to better use during these three periods is that banks were considered as levers in developing and readjusting the national economy and the regulatory mechanisms of banks were brought into play. Otherwise, if banks were considered only as a general cashier, their functions would not have been brought into full play. During the 5-year period of 1980 to 1984, the budget revenue of the autonomous region totalled 2.28 billion yuan while banks' savings deposits increased 3.96 billion yuan, equivalent to 1.73-times financial revenue. When deposits increase, banks would have more funds available to aid the economic construction of the autonomous region. To sum up 30 years of experience, we should further deepen our understanding of the position and function of banks in the national economy, voluntarily do a good job in banking work and make more contributions to accelerating the economic development of the autonomous region.

2. To do a good job in Xinjiang's financial work, we must carefully consider the actual conditions of the Xinjiang area. Xinjiang is located on the northwestern border of the motherland and exercises regional national autonomy. It has abundant natural resources, which urgently need to be developed, and a vast territory with relatively backward transport facilities. Its economic foundation is weak, production technology and managerial level are backward, its enterprise economic results are poor and its ability to accumulate funds is limited. In addition, its local financial resources are insufficient and it relies on huge amounts of state financial subsidies. In our work, we have always paid attention to taking into account these characteristics of Xinjiang and put supporting Xinjiang's development and construction before all other work. In credit work, we have paid attention to implementing the principle of suiting measures to local conditions, proceeded from actual conditions of Xinjiang's enterprises and, under the prerequisite of adhering to various basic credit principles, properly relaxed policies to increase enterprises' ability to compete. We have also paid great attention to supporting the production of special national commodities and the development of national trade.

3. We must have a currency policy that can meet the demands of economic development. Over 30 years of practice prove that the currency circulation situation must be in line with the commodity supply and demand situation on the market. We should not proceed one-sidedly from supporting economic development, and inappropriately expand the scale of credit and excessively issue currency. Banks' currency policy must be based on the dual-purpose of developing the economy and stabilizing currency. Excessive money supply is often related to the extended scale of capital construction investment and the abrupt increase of consumption funds. Therefore, banks must also pay attention to preventing the increase of money supply resulting from a loss of control over capital construction scale and consumption funds.

4. We must further reform the financial structure and perfect the socialist banking system. Since it began to exercise the special functions of a central bank, the autonomous regional branch of the people's bank has intensified macroeconomic investigations and studies and strengthened control over the money market. Moreover, beginning in 1985, it has reformed the control system of credit funds for specialized banks and achieved preliminary success in overcoming such defects as the supply system in the control of funds and the practice of "eating from the communal pot." All this is favorable for the central bank to give better play to the function of macrocontrol. After having formed a system of their own and separating their funds from those of the people's bank, specialized banks have strengthened vertical regulation and horizontal circulation of funds and brought into play their enthusiasm for making their own decisions in management and doing a good job in the control and use of funds. Neverthless, many things are not yet perfect. Judged from the situation of the autonomous region, the relations between the people's bank and specialized banks need to be smoothed out still further and the control system of funds also need to be further perfected so as to fulfill the general demand for enhanced macrocontrol and more microflexibility and meet the needs of the reform of the entire economic structure.

Bright Future

In accordance with the guidelines of the 12th CPC Congress, the total industrial and agricultural output value of the autonomous region will reach 42 billion yuan by the end of this century, more than quadruple that of the 1980's figure. This has set forth an arduous but glorious task for our Xinjiang's financial front. Our major tasks from now on are: 1) Continue to reform and perfect the financial system, give full play to the control and regulatory functions of banks in the national economy and accelerate the realization of the general goal in the modernization drive of the autonomous region; 2) use multifarious means of credit to continue to expand the sources of funds and provide more funds for the development and construction of the autonomous region; 3) continue to increase the use benefits of funds and speed up capital turnover; 4) expand and improve international financial business activities, promote exports, continue to increase foreign exchange earnings and absorb more foreign capital; and 5) strengthen the modernization drive of banks and financial organizations, gradually adopt new electronic technology, train large numbers of financial experts and continue to upgrade the modernized management of banks.

Looking ahead, we are full of pride and enthusiasm. Determined to work hard and advance while exploring, we are confident that there will be greater developments in Xinjiang's financial undertakings.

VICE MINISTER ON PRODUCTION OF MACHINE-BUILDING INDUSTRY

Beijing ZHONGGUO JIXIE BAO in Chinese 3 Dec 85 p 1

[Interview with Ding Xiaonong, vice minister of the machine-building industry, by staff reporter Chang Yu [1603 2509] on 2 December on questions concerning the production situation of the machine-building industry in 1985 and 1986: "Production Slowed Down in the Second Half of This Year and Will Pick up Steadily Next Year"]

[Text] [Question] How is the production situation of 1985? What is the estimated growth rate of 1985?

[Answer] The machine-building industry is a department that provides technical equipment for all sectors of the national economy and at the same time provides some machinery and electrical products for the daily use of the people. Therefore, the production of the machine-building industry is closely related to national economic and social development. The abrupt increases of fixed-asset investment, bank credit and consumption funds before April 1985, especially during the fourth quarter of 1984, caused the social demand for machinery and electrical products to increase sharply, resulting in a steep rise in the production of the machine-building industry. In the first quarter of 1985, the production registered a 34.4 percent increase over the the corresponding period of 1984. After April 1985, the state strengthened the control of macroeconomy and adopted a series of control measures to prevent problems which may arise as a result of the excessive growth of the national economy. Consequently, the demand of various sectors for machinery and electrical products gradually declined. Since May a few products have been returned. The growth of the production of the machine-building industry has gradually slowed down. In the first half of 1985, the total output value registered a 33.3 percent increase over the corresponding period of 1984. In the second half of 1985, some products became unmarketable. As a result, from January to October 1985, the output value registered a 28.4 percent increase over the corresponding period of 1984. It is estimated that the annual rate of increase for 1985 will be 25 percent higher than that of 1984.

[Question] How is the production situation of the machine-building industry in 1986?

[Answer] Next year will be the first year of the "Seventh 5-year Plan" period.

Arrangements for the annual production plan should be based on the "Seventh 5-year Plan" and the principles and policies put forward by the "Proposal of the CPC Central Committee for the Formulation of the Seventh 5-year Plan for National Economic and Social Development" must be implemented. In the "Explanation of the Proposal for the Formulation of the 'Seventh 5-year Plan'" Premier Zhao Ziyang pointed out: "The 'Seventh 5-year Plan' period can be divided generally into two stages. In the first 2 years, we should concentrate on bringing the aggregate social demand under control and solving such problems as excessively high growth rate, overextended scale of fixed-asset investment, and abrupt increase of consumption funds...This will be more efficient than trying to solve all these problems in the second half of this year. It can avoid the losses and shocks resulting from braking too fast." According to this, the production of the machine-building industry may pick up steadily in 1986 as a switch from gradually slowing down in 1985. It is estimated that in 1986 the general production level will be somewhat higher than that of 1985, but the rate of increase will not be very high.

[Question] How is the marketing situation of machinery and electrical products in 1986?

[Answer] The production and marketing of the machine-building industry are closely related to the arrangement for the plan of national economic and social development. According to the fixed-asset investment plan drawn up by the state for 1986, the machine-building industry will generally maintain the general investment scale of 1985 and make some minor readjustments to improve the set-up of investment and emphasize major construction projects. The demand for machinery and electrical products is expected tc increase slightly. Due to changes in the composition of investment, equipment needed by basic industries such as energy, transport, communications, and raw and semi-finished materials will increase more than in 1985. For instance, power stations, transmission and transformer equipment, and auxiliary products may increase 15 to 20 percent compared with 1985. The initial plan for the total output value of the machine-building industry in 1986 is 5.8 to 8.5 percent higher than the estimated figure of 1985. The demand for production maintenance and repairs has a vital bearing on the general level of industrial production. Fittings of industrial and mining equipment, measuring and cutting tools, welding rods and general products needed for production maintenance and repairs will increase accordingly. Products which are used mainly as components of single-unit machinery such as motors, industrial bearings and electrical elements will increase as the production of main engines increases. Since bank credit is under proper control and the purchasing power of collectively-owned township enterprises and peasants is restricted, the demand for farm machinery and vehicles will not be higher than 1985. Especially in the case of large farm machinery such as caterpillar tractors, large combine harvesters and non-popular brand vehicles, the supply may exceed the demand. The demand for household electrical appliances and other machinery and electrical products for daily use is expected to increase over 10 percent due to the adjustment of workers' wages and the increase of peasants' income. Popular-brand products in particular will still be in short supply. Export products are expected to increase by a relatively large margin because the state will take a further step to adopt policies and measures to encourage their production, but their proportion in the total output value of the machine-building industry will still be very small. When analyzing the trend of production and demand, consideration should be given to the social inventory of machinery and electrical products which is expected to decline substantially by the end of 1985 as compared to the previous years but will still account for over 60 percent of the total annual output of such products. Especially those circulation enterprises which have a large inventory of machinery and electrical products probably will stop purchasing or puchase only a small number of such products in 1986. All departments concerned and departments in charge of the machine-building industry at all levels must pay attention to this phenomenon, keep abreast of market situations, and organize production in strict accordance with social demands.

[Question] How is the supply situation of major materials and energy needed for the production of the machine-building industry in 1986?

[Answer] The state will continue to adopt measures to achieve a basic balance between the aggregate demand and supply of society in 1986. It is estimated that in 1986 the supply problem of major materials and energy needed for the production of the machine-building industry will be eased compared with 1985, but the shortage situation will not be changed fundamentally. For instance, in 1986 there will be an increase in domestic steel products and a possible slight reduction in imported steel products as compared to 1985. In addition, under the current situation of supply shortage, the inventory in the first half of 1985 increased 12 percent as compared to the beginning of 1985 and it is not expected to decline at the end of 1985. Moreover, there is a great possibility that in 1986 metallurgical enterprises will overfulfill their production tasks, which shows that there is a great potential in the supply of steel products. Some machine-building enterprises waste large amounts of raw and semi-finished materials and consume too much energy in production. Therefore, it is not impossible to overcome the supply difficulty of primary materials needed for the production of the machine-building industry if all departments unclog channels, strive to locate sources of supply, and vigorously reduce the consumption of goods and materials. With regard to energy supply, the gross value of energy output in 1986 is projected to be higher than the estimated figure of 1985. Solving the energy supply problem remains a major task for a considerable long time to come in the future. The shortage is expected to remain fairly serious in 1986. This demands that all enterprises adopt effective measures to save energy in every possible way.

[Question] What other issues do we need to pay attention to in the production of 1986?

[Answer] In 1986, we still need to adhere to and implement the principle of "three advances and one improvement" and pay attention to the following issues:

Efforts should be made to improve product quality and strengthen technical service. The practice of seeking only high speed and ignoring product quality and social and economic results must be corrected. To improve quality, it is necessary to strengthen control and technical and labor disciplines, make stricter demands, intensify quality supervision and inspection, and perfect the quality inspection system. This is a concrete expression of winning the trust of users and rendering service to the people.

Great efforts should be made to develop variety and adopt measures to launch prompt mass production of new products while doing a good job in the production of products with advanced technology. This is an extremely urgent and important task for the machine-building industry in 1986 and a fairly long period of time in the future.

To adhere to the principle of concentrating on the improvement of economic results, efforts should be made to reduce the consumption of goods and materials and the cost of production, further reduce losses, increase profits, speed up capital turnover, and prevent stockpiling and waste in addition to improving product quality.

When marketing machinery and electrical products, priority must be given to guaranteeing the supply of major state projects. This is an unshirkable duty for all departments of the machine-building industry.

Close attention should be paid to the market changes of machinery and electrical products. The principle of organizing production according to demand must be implemented to avoid stockpiling resulting from a blind input of materials.

Conscientious efforts should be made to do a good job in the production of export products, strive to expand the exports of machinery and electrical products, and earn more foreign exchange for the state. This is an important task for a fairly long time to come in the future.

In order to ensure a proper rate of increase for 1986, conscientious efforts should be made to carry out production preparation work in the fourth quarter of 1985, sum up safety work and carry out a general inspection of safety production. At present, there are many problems concerning the supply of raw and semi-finished materials. If there is a problem arranging material supply for production in the last month of 1985 and the first quarter of 1986, it is necessary to ensure a proper and normal growth rate for the production of the first quarter of 1986 even if it means an appropriate reduction in the growth rate of 1985.

INDUSTRY

INDUSTRY REACHES NEW STEP IN REFORM

Beijing BAN YUE TAN [SEMI-MONTHLY TALKS] in Chinese No 22, 25 Nov 85 pp 16-21

[Article by the editorial department of BAN YUE TAN: "Industry Ascends to a New Step in Reform--the Third of A Series of Articles on the Study of Current Affairs"]

[Text] The last year of the "Sixth 5-year Plan" is 1985. It is a year for carrying out the reform of economic structure in an all-round way. It is also a year for the industrial front to ascend to a new step and reap rich fruits.

Of the 65 major products included in the "Sixth 5-year Plan," 41 already reached the 1985 targets of the plan in the first 1 or 2 years. It is estimated that by the end of 1985, except for a few products such as yarn, cloth, and crude salt, all targets specified in the "Sixth 5-year Plan" will be fulfilled or overfulfilled.

According to a reliable forecast, the total industrial output value of 1985 will break the record of 800 billion yuan. The difference between the total industrial output value of 1985 and 1984 is tantamount to the total industrial output value of 1965--a year prior to the "Great Cultural Revolution."

Reform Makes New Steps

In 1985 the industrial front has made unprecedented achievements in regard to the extensive scale of reform, rich contents, rapid progress and remarkable results. The reform has been effectively and rapidly changing the face of China's industry and pushing industry into the new period of peak development.

Industrial reform and achivements are demonstrated mainly as follows:

1. With regard to the planning and control system, the scope of command plans has been reduced and that of guidance plans and market regulation expanded. Since the beginning of 1985, the variety of industrial products under command plans has been reduced from 123 to about 60. All products are under guidance plans except for the total social volume of major industrial products and raw materials vital for major construction projects which are under state command plans. All products under guidance plans may be sold by enterprises on their own unless this is prohibited by special state regulations. Such products may

be sold at unified fixed prices, floating prices or negotiated prices according to pertinent state regulations. The reform of the planning system has expanded enterprises' decision-making power and increased their vitality.

2. With regard to the distribution of interests between enterprises and the state, the second step in the tax-for-profit reform has been carried out in enterprises. It is obvious that this reform has served three purposes: 1) Ensured a steady increase in state revenue; 2) further expanded enterprises' financial rights and increased their share of profits; and 3) brought into play the role of taxes as an economic lever and helped strengthen macro-control.

3. With regard to increasing enterprises' vitality, enterprises' decision-making power has been expanded mainly by adopting three measures: streamlining state administration and decentralizing state powers, utilizing the internal strength of enterprises and strengthening macro-control. At present, in addition to some small enterprises which have been invigorated, about 15 percent of large and medium-sized enterprises have also increased their vitality markedly due to the conscientious implementation of a series of policies and measures of the CPC Central Committee and the State Council.

4. With regard to the leadership system and internal control of enterprises, the plant director responsibility system and the internal economic responsibility system have been carried out on a trial basis. The number of units experimenting with the plant director responsibility system has exceeded 20,000 across the nation. After implementing the plant director responsibility system, most enterprises have been able to improve production command, operational control, the ideological and political work of party organizations and the democratic management of staff members and workers. Many enterprises have established and perfected a variety of internal economic responsibility systems. Coal mines whose products are under unified state distribution have implemented a wage contract system under which workers are paid for each ton of coal produced. After more than 1 year of practice, their output has increased over 20 million tons and their staff members and workers have been reduced by over 30,000.

5. With regard to the control of goods and materials, the variety of goods and materials under unified state distribution has been reduced from the previous 256 to the current 65. The variety of goods and materials under the control of various departments has also been reduced accordingly. Small and medium-sized cities have established means of production trade centers, allowing more means of production to enter the market, regulate social supply, and demand and invigorate the market.

6. With regard to the control system of capital construction and the building industry, such reforms as changing state appropriations to loans and adopting investment contract and bid-inviting systems have been carried out. Since 1 January 1985, the investments of all capital construction projects have been changed from free appropriations to loans, the investment contract system has been adopted for more than 100 major projects and the construction bid-

inviting system has also been further publicized. These reforms have changed the situation of "endless investment and marathon construction" and achieved the good results of less investment and a shorter construction period.

7. With regard to the ownership system, the old pattern of unitary state-ownership system is now being replaced by the new pattern of simultaneous development of multiple economic sectors. Under the prerequisite that state ownership occupies the dominant position, China encourages and supports the development of collective and individual economies. In 1985, rural township enterprises and urban collective enterprises have developed rapidly and individually-owned industries have spread to all urban and rural areas of China, totalling over 400,000 units. Some state-run industries have switched to collective management while maintaining their state ownership. Others have been contracted to collectives or individuals to be managed. The development of collective and individual enterprises has served the purposes of filling up the vacancies and invigorating the economy.

8. With regard to economic ties, horizontal economic and technological cooperation and integration have become the trend of economic development in China. At a cooperation meeting jointly sponsored by the six large regions of China, agreements were reached on over 6,000 cooperative projects involving a total value of 3 billion yuan. Integrated bodies of urban technological cooperation, inter-trade and transregional integrated bodies of enterprise, technological markets, and consulting service networks have been established. The strengthening of economic ties has enabled advanced technology to transfer at an unimaginable speed from the east to the west, from urban areas to rural areas, from military to civilian sectors, and from scientfic research to production.

Production Ascends to a New Step

Under the motive forces of reform and the open-door policy, China's industrial production has maintained the favorable momentum of sustained, steady and coordinated development in 1985. The industrial production of 1985 has the following characteristics:

The development of light and heavy industries is balanced. For a fairly long time in the past, the ratio of heavy industry was too high compared to that of light industry and heavy industry failed to serve the development of light and textile industries and agricultural production. This posed an essential problem which remained unsolved for a long time in China's economic construction. At present, agriculture, light industry, and heavy industry each account for approximately a third of the gross value of China's agricultural and industrial output and light and heavy industries each account for approximately a half of China's industry. Judged from the development level of China's productive forces, these ratios are balanced in general. From January to October 1985, the ratio of light industrial value to heavy industrial value was 49.8:50.2 which is expected to change to a more reasonable ratio of 50:50 by the end of the year. Compared with 1978 when light industry accounted for 43.1 percent and heavy industry accounted for 56.9 percent, there has been a drastic change. This is the result of years of readjustment of the national economy.

The growth of energy production is even. From January to October, total energy output amounted to 690 million tons of standard coal, a 10.4 percent increase over the corresponding period of 1984 and a record high rate of increase in recent years. What is more encouraging is the even growth rate of total energy output which maintained a monthly increase rate of about 10 percent. At the same time, coal, electricity and oil output has also increased in an all-round way at the highest speed in recent years. Implementing the principle of simultaneously developing all sizes of state, collective and individual enterprises, township coal mines and small hydraulic power stations have suddenly come to the fore, made rapid developments and become a new force of China's energy production. Now there are over 60,000 township coal mines and over 70,000 small hydraulic power stations across the country. They have made distinct contributions to alleviating local energy shortages.

Popular-brand, good-quality, readily marketable light and textile products have increased by a wide margin. Since the beginning of 1985, due to a large social demand, light, textile and electronics industries have developed at a fairly high speed. At the same time, they have changed product mix and increased variety, designs and high- and medium-grade products through integration, cooperation and technological transformation. In the first 10 months of 1985, household appliances such as refrigerators and color TV sets increased 1.8- and 2.4-fold respectively; wool fabric, paper, cardboard, and cameras increased from 13.5 to 42 percent respectively; and the output of popular-brand products such as Fenghuang and Yongjiu bicyles, Wanbao and Xuehua refrigerators, and Bailan and Youyi washing machines increased by an even wider margin. Another change in the light, textile, and electronic products of 1985 is that product variety and designs have increased substantially and the ratio of high- and medium-grade products has increased.

Most products of the raw and semi-finished materials industry have increased steadily. In order to guarantee the needs of major construction projects and industrial and agricultural production, the rates of increase for the output of steel products, steel, and pig iron have been stabilized between 6 to 10 percent while steel plates, seamless steel tubes and small wire rods have been allowed to increase by a larger margin. The output of cement, plate glass and soda ash has also increased by varying degrees.

In the first half of 1985 some people had some worries about the excessively high speed of industrial growth, the decline in product quality and the slow improvement of economic results. Thanks to the efforts of all fields, these problems are now being gradually solved.

1. Industrial growth has gradually slowed down. In the first half of 1985 the industrial growth rate was relatively high and the monthly increase was between 22 to 25 percent compared with the corresponding period of 1984. In July, the rate of increase began to decline. By October, it had declined to 11.7 percent. The annual increase rate is estimated at about 19 percent.

2. The tendency of quality decline has already stopped. The quality of many products has begun to improve.

3. Economic results have somewhat improved and revenue has increased by a wide margin. From January to October, energy consumption was reduced, labor productivity increased and circulating fund turnover speeded up in industrial production. What is especially noteworthy is that output value, tax and profit delivery to the state, and revenue have continued to increase in tandem.

New Progress in Technology

In 1985 and the "Sixth 5-year Plan" period, China's industrial front made outstanding progress in technology and provided reserve strength for economic development in the "Seventh 5-year Plan" period. Technological progress is demonstrated mainly in the following aspects:

Major construction projects focusing on energy and communications projects have progressed smoothly and a number of enterprises with relatively advanced technology and equipment have been completed and put into production. From January to September, China has completed and put into production 14 large and medium-sized projects and 24 single-item projects. Among the major large and medium-sized projects completed are the Dahua Hydraulic Power Station of Guangxi and the Mudanjiang Power Plant of Heilongjiang which each have an installed capacity of 400,000 KW and the Qinghai-Xizang highway reconstruction project (the section between the Xieshui He of Qinghai and Lhasa). Among the single-item projects completed are the Liaohe and the Xinjiang oilfield construction projects, which have increased crude oil production capacity by 1.2 million tons and 600,000 tons respectively, and the second-phase construction of the coal wharf of the Qinhuangdao harbor. What is especially encouraging is that the first-phase construction of the Baoshan General Iron and Steel Plant of Shanghai, which has the international standards of the late 1970's, has been basically completed and began trial production in mid-September. It has produced iron, steel, and steel products.

All 50 large and medium-sized projects and 114 single-item projects which the state plans to complete and put into production in 1985 will be completed and put into production before the end of 1985 except for a few where there are still some problems waiting to be solved. Among the plans designed to increase energy and communication production capacity in the "Sixth 5-year Plan" period, plans to increase power generating capacity and coal and crude oil production have been overfulfilled; plans to increase the mileage of multi-track railways and rail electrification have been fulfilled by about 90 percent.

Technological transformation has been strengthened. During the "Sixth 5-year Plan" period, the rate of increase for rennovation and transformation investment has been higher than that of capital construction investment in existing enterprises and institutions and 80 percent of the renovation and transformation investment has been used for increasing production, practicing economy, increasing product variety, and improving product quality. During the 4 years between 1981 and 1984, state-owned industrial enterprises began nearly 200,000 investment projects concerning technological measures, invested a total of 94.75 billion yuan and completed 99,000 transformation projects, averaging 1.14 project per enterprise.

Technology import has been quickened and its scale gradually expanded. According to statistics, from 1983 to the first half of 1985, state foreign exchange has been used to sign contracts and conclude over 3,000 deals which involve nearly $3 billion, thereby fulfilling ahead of schedule the plan of the State Council to import 3,000 technological items in the last 3 years of the "Sixth 5-year Plan" period to transform existing enterprises. The overwhelming majority of these projects are the advanced technologies of foreign countries in the late 1970's and early 1980's.

Technological imports and transformation have played a positive role in accelerating the improvement of quality, variety, standards and economic results of China's industry. For instance, coal mines whose products are under unified state distribution have increased the degree of mechanization in coal mining; the proportion of high-temperature and high-pressure generators in all generator sets has been increased; the textile industry has increased its processing capacity in the post treatment, calendering and glazing of polyester-cotton; and energy consumption has been markedly reduced in metallurgical and chemical production. The economic results of imported technology are very outstanding. According to the survey of imported projects already completed and put into production in Beijing, Tianjin and Shanghai, on the average each 1 yuan of investment can create 2.5 to 2.8 yuan of output value and 0.5 to 0.8 yuan of tax and profit delivery a year and it takes only 2 to 3 years to recover all the investment.

Continue To Scale New Heights

Major problems now existing on China's industrial front are as follows. There is much to be desired in revitalizing enterprises, especially state-owned large and medium-size enterprises; they have not really become relatively independent socialist commodity producers and dealers who have decision-making power in management and assume sole responsibility for their own profits and losses; their product quality is poor; their material consumption is high; they use a large amount of circulating funds; and their product mix is irrational.

We believe that under the leadership of the party and amid structural reform and technological progress, the over 50 million staff members and workers of China's industrial front will gradually solve these problems in the "Seventh 5-year plan" period and lay a solid foundation for China's industrial takeoff in the 1990's.

SHORT-FIBER POLYESTER EQUIPMENT MANUFACTURED

Beijing GONGREN RIBAO in Chinese 25 Dec 85 p 1

[Article by reporters Shen Jianhong [3088 0494 5725] and Qian Peijian [6929 1014 1017]: "A Complete Set of Short-fiber Polyester Equipment With an Annual Capacity of 15,000 Tons Passed Examination"]

[Text] A complete set of short-fiber polyester equipment with an annual production capacity of 15,000 tons, which is one of the major scientific and technological projects in the "Sixth 5-year Plan" period, was successfully manufactured after over 4 years of efforts and passed the state examination on 24 December in the auditorium of the scientific and technological association of the Shanghai General Petrochemical Plant.

Designed and manufactured by China, this complete set of short-fiber polyester equipment ranks first even on a world-wide scale. Since the beginning of the project in 1981, over 40 major units of 10 provinces and municipalities have joined in the battle to produce the equipment. Each of the six production lines consists of 141 individual machines of 73 different types. Among them, 20 individual machines of 9 types are quality products imported from abroad. Total investment for building this equipment is 100 million yuan less than that for importing a complete set of similar equipment. The results of the examination show that the top-quality product rate of this domestic-made spinning equipment averages over 95 percent. As of today, this equipment has produced 62,500 tons of short polyester fiber, created 160 million yuan of tax and profit delivery to the state and basically recovered all construction investment. The production technology and equipment of these six production lines are close to advanced international standards. They have basically met the requirements for the large capacity of equipment, the continuation of technological process, the diversity of products and rational labor protection. They have also adopted the advanced technology of direct melting spinning. With each link connected to another in the whole process from melting polyester to dying and storing fiber, these production lines can produce a variety of fibers blended with wool or cotton. They will cause a major impact on enriching domestic chemical-fiber markets and beautifying the people's daily life.

The State Council sent a telegram to congratulate the examination and sum-up meeting. Hao Jianxiu, secretary of the Secretariat of the CPC Central Committee, delivered a speech at the meeting.

Hao Jianxiu said: Considering from a long-term point of view, China's economic development cannot rely on and be controlled by foreign countries and always remain behind advanced countries. To build an advanced, modern socialist country and enable China to rank among the world's most advanced, we must work hard and dare to challenge the most difficult, scale the heights and take risks. The successful research and manufacturing of the complete sets of 15,000-ton short-fiber polyester production equipment and technology are an example of success. It has not only boosted the morale of the Chinese people but also increased our confidence in relying mainly on our own strength to revitalize the Chinese nation. This spirit of pioneers who dare to take risks and volunteer to shoulder heavy responsibility is exactly what we want to advocate and develop during the four modernizations.

Over 400 representatives of various departments participating in the project attended the sum-up and examination meeting on 24 December. Wu Wenying, minister of the textile industry, summed up the results of the project. Six units, including No 2 Polyester plant of the Shanghai General Petrochemical Plant, at the meeting received silk banners displaying the words "aim high, go all out, and carry out a still greater plan."

SMALL-SCALE ENTERPRISES

ACHIEVEMENTS OF ANHUI TOWNSHIP, TOWN ENTERPRISES EXAMINED

Beijing ZHONGGUO XIANGZHENQIYE BAO in Chinese 22 Feb 86 p 1

[Article by Wang Yuling [3769 3768 3781], Gu Lijun [7357 4539 6511], Wu Jiang [0702 3068]: "Anhui Township and Town Enterprises Achieve Remarkable Success; Last Year's Total Output Value Equal to the Total of 4 Post Years; Number of 100-Million-Yuan Counties Increases by 30"]

[Text] The Anhui provincial CPC committee and government regard the development of township and town enterprises as a major strategic measure in stimulating the rural economy, has beefed up the forces of all management sectors at all levels and promoted the development of such enterprises. Last year gross output value for township and town enterprises provincewide reached 8.52 billion yuan, nearly equivalent to the total figure for the past 4 years, and a 81.2-percent increase over the year before. The amount of profit realized and taxes submitted grew 72.4 and 87.3 percent, respectively, over the year prior. The number of counties where output value exceeded 100 million increased from 15 the year before to 45 last year.

The rapid development of Anhui's township and town enterprise has helped to advance the readjustment of the rural industrial structure. Last year township and town enterprise output value accounted for 16 percent of total output value for the province and for 36 percent of GVAO. The position of township and town enterprise in the province's economy is growing increasingly important. Its coal production is 50 percent of local production volume for the entire province; iron ore is 71 percent and its brick production, 83.2 percent. In addition, tertiary industry in the townships and towns has also developed rapidly. In Hefei, Fuhu, and other cities, the number of beds in peasant-run hostels now exceeds the total for state-run hotels. At present 3.31 million are employed in township and town enterprises, or 17 percent of the province's total rural labor force.

Gross output value in 1983 for the township and town enterprises of Anhui, a province with a fairly weak base and slow to begin reform was only 1.9 billion yuan. Due to the great efforts of the provincial CPC committee and government these last few years in developing township and town enterprise with the cooperation of all sectors, development has been rapid throughout the province. Household- and combined household-run enterprises have sprung up all over and showed a 175-percent increase last year in output value compared to the year before, which accounted for 44 percent of gross output value of all township and town enterprises.

SMALL-SCALE ENTERPRISES

LIAONING TOWNSHIP, TOWN ENTERPRISE DEVELOPMENTS REPORTED

Beijing ZHONGGUO XIANGZHENQIYE BAO in Chinese 19 Feb 86 p 1

[Article by Shi Yongsheng [0670 3057 3932]: "Secretary Li Guixian of Provincial CPC Committee Proposes That Great Efforts Be Made To Develop Township and Town Enterprises"]

[Text] Li Guixian [2621 6311 7639], secretary of the provincial CPC committee, proposed recently that great efforts should be exerted to develop township and town enterprises.

Recently the sixth plenum of the second Liaoning Province CPC Committee and the Rural Work Conference were convened. Li Guixian, CPC committee secretary, proposed work plans for 1986. He said that in order to increase rural productivity, the labor force must be divided up among local industry, transportation, service, and other local industries. In this we must emulate Jiangsu and exert great efforts to develop township adn town enterprise. This is our only way out.

To develop township and town enterprise, we must thoroughly implement the relevant guiding principles and continue to liberalize policies to create the necessary conditions for the even more rapid development of township and town enterprises as relates to funding, materials, personnel, and technology. In order to resolve the funding problem, in addition to relying on the accumulation of funds raised by the enterprises themselves, last year the province supplied them 30 million yuan circulating funds. Seeing as the cities and counties have more money this year, I suggest that they give a little more to support township and town enterprises. As for the technology problem, since we have so many large cities and retired personnel, we could employ them in addition to using various channels to train staff. We should not be afraid, because if we do our job well, there will not be any problems. Regarding the problem of raw materials, the goods and materials departments at all level must support township and town enterprise. Some products that are part of the plan and export products must be provided them in a planned fashion without discrimination. We must improve technical reform and raise the technical and production levels of township and town enterprises. Township and town enterprises, too, should be able to enter world markets, not just state-run enterprises.

PROBLEMS OF LIAONING TOWNSHIP, TOWN ENTERPRISES DISCUSSED

Beijing ZHONGGUO XIANGZHENQIYE BAO in Chinese 22 Feb 86 p 1

[Article: "Liaoning Township and Town Enterprises Overcome Shortages of Capital, Natural Disasters, and Other Serious Problems To Earn 14 Billion Yuan in Revenue"]

[Text] Faced with macroeconomic controls, a tight money market and serious natural disasters, Liaoning Province's township and town enterprises overcame countless difficulties in 1985, continued to develop and fulfilled plan norms 2 months ahead of time. The figure for last year's total revenue for the province's township and town enterprises may reach 14 billion yuan, for an approximate 50-percent increase over the year before. Tax revenue amounting to 1.43 billion yuan was remitted to the state, for an increase of 24.9 percent compared to the year prior.

Profound changes in the rural economy have occurred along with the development of township and town enterprise. More than 2.17 million members of the rural labor force have shifted over to township and town enterprises and now account for 29 percent of the total rural labor force. In some regions where township and town enterprises are more developed, 50 to 80 percent of peasant income is derived from such enterprises. Despite serious natural disasters last year, township and town enterprises showed tremendous economic strength and demonstrated their vital supporting role in the rural economy. Township and town enterprises are making increasingly larger contributions to the state. During the Sixth 5-Year Plan, taxes paid by the enterprises to the state were five fold greater than the amount invested in them by various levels of the provincial government for the same period. Approximately 50 percent of the profit was used in agricultural production and village and town construction.

Liaoning's numerous large and medium-sized cities and its well developed industry form advantageous conditions for the development of township and town enterprises. The provincial CPC committee has called for the cities, large industry, and state-run industry to spur on the countryside, small-scale industry, and township and town industry. At present there are more than 3,000 township and town enterprises in the province that have coordinated their activities with urban factories and mining enterprises, universities and technical schools, and units of scientific research, promoting the development of production. Doing processing work for the cities has now become one of three major township and town enterprises in Liaoning, with an output value accounting for 31.3 percent of the total.

SMALL-SCALE ENTERPRISES

FUNDING PROBLEMS OF HENAN TOWNSHIP, TOWN ENTERPRISES DISCUSSED

Beijing ZHONGGUO XIANGZHENGQIYE BAO in Chinese 19 Feb 86 p 1

[Article by Zheng Yunmin [6774 6663 2402]: "Henan Province Township and Town Enterprise Output Value Reaches 15 Billion Yuan; Five Transformations Implemented, Sustained Growth in Production Achieved"]

[Text] Despite funding difficulties, township and town enterprises in Henan have energetically implemented the "five transformations" and are showing sustained, stable development. Township and town enterprises provincewide increased last year from 770,000 the year prior to 1.09 million, for an output value of 15 billion yuan, a 50-percent increase over the year before. The five transformations consisted of:

1. A shift from relying on bank credit to run enterprises to the enterprises raising their own funds. According to incomplete statistics, nearly 500 million yuan in funds were raised last year throughout the province, of which 190 million yuan were raised by the new townships and prefectures. Output value increased 380 million yuan.

2. A shift from a two-level system of enterprise management (township and village) to "five wheels turning at once," with the focus on household and combined household enterprise. Last year the number of enterprises run by individual households, combined households and village people's governments increased to 1.01 million, or 92.6 percent of all township and town enterprisexx enterprises, with an output value of 8,279,000,000 yuan, or 52.4 percent of total output value for all grade-5 enterprises. In areas such as Shangqui, Zhoukou, Kaifeng, Nanyang, and Zhumadian where township and town enterprise had a late start, the speed of development has been particularly surprising. Output value for Shangqiu Prefecture's tertiary enterprises accounts for 70 percent of the total.

3. The transformation of the old commune production teams- and brigade-run enterprises to cooperative stock enterprises. Last year the experience in reform of Mi County in "cleaning up production, examining capital, setting prices, and buying shares, cooperative business, and profit sharing according to the amount of stock held" was popularized provincewide, which led to increased economic returns for the enterprises. After the reform of the 22 township-run enterprises of Sanmenxia, output value doubled and profits increased 3.7-fold.

4. The shift from "extensive" to "intensive" development. Last year township and town enterprises zeroed in on business management and technological innovation, thereby increasing economic returns. By taking measures such as improving technique and increasing product variety, township and town enterprises in Mengjin County increased output value 51 percent, and profits by 107 percent.

5. The shift from isolated to open forms, the widespread development of importation from the outside and contacts with the interior and the strengthening of urban-rural cooperation. Last year, township and town enterprises in Henan brought in 450 million yuan in capital, more than 5,600 pieces of equipment, over 3,900 technologies and more than 27,000 scientific and technical personnel and developed 6,600 urban-rural combined enterprises. The more than 300 cooperative enterprises run by 90-odd large factories and scientific research units in Loyang City together with villages in the metropolitan area showed an increase in output value of more than 200 million yuan and in profit of 26 million yuan in the same year.

RAPID GROWTH OF YUNNAN TOWNSHIP, TOWN ENTERPRISES REPORTED

Kunming YUNNAN RIBAO in Chinese 17 Feb 86 p 1

[Article: "Growth Rate of Township and Town Enterprises in Yunnan Last Year Exceeds that of Any Previous Year; 'Prosperity Through Growth' Discussion Liberates Thinking, Promotes Commodity Production"]

[Text] Last year Yunnan's township and town enterprises showed encouraging growth. According to preliminary statistics of the relevant departments, the total number of enterprises reached 170,000, double that of the year before. Nearly 1 million persons were employed in the enterprises, for a 31-percent increase over the year before, while total revenues were 2,426,000,000 yuan, an increase of 40 percent over the year prior. Compared to 1980, this figure quadrupled in 5 years, for an average annual increase of 32.3 percent. Last year's development was the most rapid to date.

Last year a great discussion on "prosperity through growth" was initiated throughout the province, which liberated the thinking of the cadres and masses. CPC committees and governments at all levels are treating the development of township and town enterprise as a strategic measure in realizing the goal of doubling agricultural production, while the vast ranks of the peasants see their participation in industry and sideline business as a route to enrichment. All levels have coordinated their efforts to energetically develop township and town enterprise. For example, in Kunming City the number of enterprises run at the prefectural level increased 35.5 percent, while township and town enterprises grew 32.3 percent and village-run enterprises increased 19.5 percent. Household and combined household enterprises also showed great growth. For household and combined household enterprises alone, total enterprise revenues created eightfold to 98.29 million yuan from 10.91 million yuan the year before. In addition to the sustained growth of township and town enterprises in advanced prefectures, most prefectures with poorer conditions are also catching up. Township and town enterprise revenue in the Dali Bai Nationality Autonomous Prefecture grew 74 percent over the year before, and 70 percent in Lincang Prefecture. The figure for Nujiang Prefecture where township and town enterprise had a late start more than doubled. The following characteristics were observed in all regions in the development of township and town enterprise:

--New developments were made in the bringing in of technology which grew along with the urban reform. More and more technologies and talented personnel have been reaching the countryside. Taking note of this trend, many township and town enterprises have taken the initiative to link up with departments of scientific research, universities, technical schools and state-run enterprises to obtain a variety of technology. Last year, agreements on 702 technical cooperation projects were reached provincewide; 530 have already been implemented. This has led to the integration of surplus urban personnel, technology, capital, and equipment with rural natural resources to form a new productive force.

--Enterprises have been created by amassing capital from various sources. Despite the overall shortage of funding, many places have refused to wait passively and have used a variety of avenues to amass capital to run enterprises, thus resolving the problem. They have, for example, improved enterprise management, seeking every way possible to increase their own funds; raised funds from the peasants and the collective by issuing dividents; developed combined enterprises to attract capital from state-run and other enterprises; implemented compensation trade to earn capital from accepting orders for products; and squeezed a little money out of local reserves to focus on supporting core enterprises.

--Outstanding development in mining industries has occurred. Last year, after the convening by the provincial CPC committee and government of the mining development conference, township and town mining enterprises have developed rapidly. The total number of small mines in the province grew to 1,267 and small coal mines increased to 5,700, providing more than 600 tons of raw coal to the state in 1 year. In addition, 1.1 million tons of iron ore were provided to the state, as were more than 300,000 tons of manganese, lead, zinc, aluminium, copper, and other ferrous metals. Total production output of raw coal, iron ore, phosphate rock, sulphur, manganese, and other major products produced by township and town enterprises accounted for approximately 40 to 80 percent of total output of those products provincewide.

INDUSTRIAL TRADE CENTERS STIMULATE HORIZONTAL TRADE

Beijing LIAOWANG [OUTLOOK] in Chinese No 47, 25 Nov 85 p 6

[Article by Ji Shifa [1213 0013 3127] and Li Haifu [2621 3189 3940]: "Industrial Goods Trade Centers Revitalize Circulation"]

[Text] Along with the development of the commodity economy and the opening of the market, a group of industrial goods trade centers have been established nationwide in the past few years. Characterized by their unique openness, flexibility and service, these trade centers have given a better play to the function of organizing commodity circulation on the basis of urban areas.

We relied for many years on a closed, multi-link, distribution-type, vertical commercial wholesale system which is very unsuited to today's flourishing commodity economy. Under such conditions, open trade centers emerged as the times required and injected new energy into commodity circulation. Take the Anyang Industrial Goods Trade Center of Henan Province for example. Implementing the principle of "opening the door wide to promote purchases and sales in a big way," the center is open to all customers. State-run collective, individual, industrial, commercial, town and township enterprises are all allowed to talk and do business at the center. They are all welcomed with equally warm service. As a result, the center has enjoyed unprecedentedly brisk business. Between June 1984 and the end of October 1985, over 6,400 industrial and commercial enterprises and over 2,800 individual and coordinated industrial and commercial enterprises of 28 provinces, municipalities and autonomous regions throughout the country came to the center to talk business and strike deals worth more than 800 million yuan. For another example, the Lanzhou Industrial Goods Trade Center adopts the principle of "making no distinction between north and south and between public and private sectors, placing no restrictions on manufactures in procurement and setting no limits on volume in supply." It pursues a flexible pricing system and open operations. Since it began operations in July 1984, it has purchased 410 million yuan of commodities and made 450 million yuan in sales. The practice of many industrial goods trade centers such as the ones in Anyang and Lanzhou shows that exchanging commodities through trade centers is conducive to linking production directly to marketing and breaking regional and industrial barriers. It is an ideal form for unclogging circulation channels and speeding up commodity circulation.

At present, the main channel of commodity circulation in China is still state-run wholesale enterprises which cannot be possibly replaced by industrial goods trade centers. But if the two are totally separated and set against each other, it would be unfavorable for the development and survival of industrial goods trade centers and more so for the revitalization of the socialist market. Because of this, establishing an organic link between industrial goods trade centers and commercial wholesale companies, enable the wholesale enterprises to play a leading role in multi-channel business deals and trading acitivites organized by the trade centers and help the trade centers to render better multi-purpose service for the wholesale companies to increase their vitality has become an important task for the reform of the commercial wholesale system. The success of the Anyang and Lanzhou industrial goods trade centers can be attributed precisely to the fact that they have properly handled their relations with state-run commercial wholesale companies. It has not only helped them achieve marked economic results in accelerating commodity circulation but also helped commercial wholesale enterprises achieve good economic results. Profits earned by Anyang's three wholesale enterprises and taxes and profits delivered by them to the state in the past year or so increased 24 and 34 percent respectively over the period before the trade centers were established.

Industrial goods trade centers are mostly service-management types or management-service types. Without multi-purpose service, the trade centers would be unable to organize trading activities. Therefore, they should continue to improve service facilities and strengthen service functions, which require funds. Relying on the state for more investment is out of the question and rent and lease money and commissions are too little; therefore, they should develop their own business operations while doing a good job in circulation service to accumulate funds and increase their potential for development. The self-reinforcement of industrial goods trade centers and the full development of their functions and roles are bound to invigorate the socialist market and help commodity circulation to play an increasingly positive role.

DOMESTIC TRADE

WAN LI, LI PENG URGE GREATER HORIZONTAL COOPERATION

Beijing RENMIN RIBAO in Chinese 30 Dec 85 p 1

[Text] During the national economic and technical cooperation work conference, Comrades Wan Li [8001 6849] and Li Peng [2621 7720] each heard reports on the situation in economic and technical cooperation. They affirmed the achievements which economic and technical cooperation has brought about, and demanded that all localities and sectors vigorously promote horizontal economic cooperation based on the principle of mutual benefit.

Wan Li said, "Nationwide, economic and technical cooperation work has been quite beneficial in the last couple of years. It is a very important piece of work and can vastly benefit economic invigoration. We must achieve the three transfers: the transfer of technology, skilled personnel and products. In short, we must pursue an open-door policy. Transferring coastal technology to the interior works to the advantage of both sides. We must break down barriers; whoever is surrounded by them will fall behind. Transferring coastal technology and products to the interior is not easy; there are bound to be some impediments. The reluctance of developed areas to pass on technology or products, for example, or the inability of backward areas to digest them. Hence, economic and technical cooperation must proceed according to the principle of mutual benefit."

Wan Li said, "Business management is a big issue. It will not do to have good technology without sound management. We must step up the training of cadres. We must prosper together. Those who are diligent, efficient and capable should naturally prosper ahead of others. Correspondingly, those who are indolent and unwilling to work will not prosper quickly. Egalitarianism and eating out of the same big pot will not get us anywhere."

Wan Li pointed out, "The State Economic Commission must concern itself with national economic and technical cooperation and do so with good results."

Li Peng stressed that like obtaining patents which can mean economic rewards, economic and technical cooperation and linkage should mean the transfer of technology in return for royalties. He said, "Economic and technical cooperation and linkage are technology transfer writ large. The transfer of technology in return for royalties helps promote the popularization of technology and encourages invention and innovation. What is not permitted is charging exorbitant prices, not to mention fleecing. Technology transfer as a form of economic and technical cooperation plays an important role in invigorating China's enterprises and making its economy prosper."

Li Peng said, "With power decentralization, enterprises have become more autonomous, but changes have also occurred in their original patterns of economic cooperation. To make better use of their potential in such areas as raw materials and skilled personnel, a good method is to develop inter-enterprise cooperation in the form of integrated bodies. Such bodies may come in a variety of shapes and sizes and are more or less tightly knit. Some straddle sectors, regions and systems of ownership. Subsidiary relations need not be affected in all cases. When enterprises want to establish integrated bodies, the agencies should not stand in their way unreasonably but should give them support."

Li Peng said, "Economic and technical cooperation has had a very impressive record in recent years and is gaining strength all the time. It is an important part of the reform of China's socialist economic system. The development of our economy is grossly lopsided. The gaps between the eastern and western parts of the nation are an objective reality and imbalances exist even within a province or region. To make sure that advanced technology and experience are disseminated and applied, a good approach is to augment horizontal linkages and promote cooperation and exchanges."

TIANJIN'S HORIZONTAL ECONOMIC TIES DISCUSSED

Beijing RENMIN RIBAO in Chinese 12 Nov 85 p 1

[Text] In the past few years, Tianjin's transregional horizontal economic relations have developed rapidly. Its economic activities are gradually developing from a simple vertical link to a horizontal link between different regions and industries.

Since 1980, Tianjin Municipality has established long-term economic cooperative relations with 22 provinces and municipalities. The cooperative office of the municipal government alone has organized talks on over 4,200 projects including over 700 projects of integration, over 2,500 projects of technological cooperation and 930 projects of personnel cooperation. About 50 percent of these projects have been completed or basically completed. In order to adapt to horizontal economic development, the Tianjin Municipal Government has set up administrative organs in Beijing, Shanghai, Guangzhou and Shenzhen. More than 20 provinces and municipalities have set up government administrative offices in Tianjin Municipality. The economic cooperative office of the Tianjin Municipal Government has also established information exchange and cooperation relations with 150 units of 28 provinces and municipalities. A horizontal economic network which links upper and lower levels and departments at the same level is now taking shape.

In order to perform the function of a central city, Tianjin Municipality has also established throughout the country more than 30 different types of trade centers and 427 differnt types of technological development and consulting service organizations, accelerating the exchange of goods and materials, commodities and scientific and technological achievements. Through various forms of integration and cooperation, the economic cooperation office of the Tianjin Municipal Government alone has purchased more than 100 varieties of goods and materials in short supply which amount to 1.6 billion yuan in total value.

SHANDONG DEVELOPS EXPORT-ORIENTED ECONOMY

Beijing GUOJI SHANGBAO in Chinese 21 Oct 85 p 2

[Article by Li Chongwei [2621 1504 1218] and Chen Jiaqin [7115 1367 0530]: "Shandong Province is Advancing Toward the Direction of Developing An Export-oriented Industrial Structure of Trade, Industry and Agriculture"]

[Text] The total export volume of Shandong Province is one of the largest in the country. Since the beginning of this year, in spite of a national shortage in the sources of export goods, Shandong has had an abundant supply of goods and managed to increase exports due to leaders' attention and proper measures. This year, Shandong Province is planning to strive to over-fulfill the state-assigned export plan.

The reason Shandong's export trade can develop so fast is that they have already begun developing step by step an export-oriented industrial structure of trade, industry and agriculture. Their major experiences are as follows:

1. Major leading comrades have been personally involved in investigations and studies and paid great attention to ensuring the sources of export goods. Since the beginning of this year, party committees and government organs at all levels in Shandong Province have further strengthened leadership over export work. Liang Buting, secretary of the provincial CPC committee, has attended many briefings on foreign economic relations and trade of various cities and prefectures and helped them solve problems in this work. In April of this year, the provincial government held a special work conference on foreign trade and exports. Proceeding from the reality of Shandong Province, participants at the conference studied and formulated several measures and methods to encourage exports and support production. They also stressed the sources of export goods and marketing promotion in foreign countries. Not long ago, Governor Li Changan personally led a group and visited provincial foreign trade departments and various specialized import and export subsidiary companies. He organized many forums on the question of how to strengthen export work and mobilized the people to suggest ideas and ways to increase exports and foreign exchange earnings. In order to do a good job in the peak procurement period in the second half of 1985, the provincial government recently held another forum on export issues in Yantai. Participants at the forum conducted discussions around such issues as how to ensure the fulfillment of this year's export plan, how to strive to increase exports and

foreign exchange earnings and how to develop step by step an export-oriented industrial structure. In accordance with the tentative ideas provided by the "Seventh 5-year Plan," they also proposed 34 projects on integrated and joint management of industrial, mining and agricultural production so as to expand exports and thereby laid a material foundation for further expansion of foreign trade and exports.

2. Joint ventures and integrated operations of trade, industrial and agricultural units has been practiced in accordance with the demands of specialized division of labor and systemized production. Chicken meat and asparagus are two major traditional export commodities of Shandong Province. Over the years, Shandong has developed a new way of systemized production and exports under the structure of trade, agriculture and industry. The Weifang area is a production base for chicken meat. Zhucheng County organized a joint-investment coordinated operation based mainly on local and provincial foreign trade bases and companies and foreign trade cold storage and processing plants. In other words, the whole process from developing improved breeds to building major chicken farms run by specialized households, processing and supplying special fodder and processing products was made into a systematic, coordinated joint operation which has yielded good results. While doing a good job in thousands of chicken farms, Zhucheng County has paid special attention to major chicken farms run by specialized households. It has built 44 chicken farms in its 35 townships, towns and villages. Each of these farms has a capacity of producing 50 tons of chicken a year. They are given the priority in the supply of improved breeds and fodder and in the procurement and processing of grown chickens. The Shandong subsidiary of CEROILFOOD [China National Cereals, Oils, and Foodstuffs Import and Export Corporation] cooperated with a frozen chicken import company of Japan in establishing two special frozen chicken storage and processing plants in Yexian and Zhucheng counties. These plants are designed in accordance with the needs of the Japanese market to produce only about a dozen varieties to be exported to Japan. Such a small town enterprise which serves as a joint export commodity production base by integrating the operations of stud farms, major specialized households, fodder processing plants and cold storage and processing plants through the channel of foreign trade is capable of bringing local advantages into full play, providing an ample and steady supply of high quality, marketable goods for expanded exports and increasing peasants' income and market supply at home.

3. Shandong has tried evey possible way, starting with developing production, to increase the sources of export goods through joint ventures and integrated operations of industrial and trade units and many other flexible forms of management. Major forms are as follow:

A. Joint ventures of industrial and trade units. The Shandong subsidiaries of SINOCHEM [China National Chemicals Import and Export Corporation], MINMETALS [China National Metals and Minerals Import and Export Corporation], and CEROILFOOD have all adopted this form. For instance, the Shandong subsidiary of SINOCHEM, the Luyuan Company and the Zhucheng County Foreign Trade Company signed a contract with six chemical plants in Anqiu and Zhucheng counties on joining investment to carry out six projects which have yielded quick results with little investment.

B. Exports on a commission basis and integration with inland areas. Alumina is one of the major export commodities of the Shandong subsidiary of MINMETALS. In the past, it was mainly shipped in from Henan and Shanxi provinces. In view of changes in the sources and supply of goods which occurred after domestic markets were opened up, the Shandong subsidiary of MINMETALS has sent people on many occasions to Henan, Shanxi and Guizhou provinces to discuss ways to carry out integrated operation of alumina business since the second half of 1984. They signed an agreement with Shanxi on the exports of 100,000 tons of alumina on a commission basis. They also went to 30 mines in Henan and signed contracts on the direct procurement of 200,000 tons of alumina. In addition, they signed an agreement with the Henan branch of MINMETALS on consigned shipment. Under this agreement, 2 percent of the total value of the goods will be given to the Henan company as a fee for handling. After goods arrive at Qingdao, they will be processed first and then exported. This is a new form of integration between port cities and inland foreign trade companies.

C. Compensation trade. Through the form of compensation trade, the Shandong branch of MINMETALS has increased the production of granite, graphite and drawn wires for exports and achieved very good results. Granite produced in the Hongning Town Granite Mine of Wulian County is of outstanding quality and very popular among foreign buyers. However, due to a lack of production machinery and equipment, this mine cannot increase output. In view of this, the Shandong branch of MINMETALS, after contacting its headquarters, signed a 10-year supply agreement with the mine in the form of compensation trade. Beginning this year, this mine will supply 1,300 to 2,000 cubic m of crude granite for exports every year.

D. Flexible forms of business such as barter and processing of imported materials. The Shandong branch of MINMETALS signed an agreement with Guizhou on the exports of 20,000 tons of alumina on a commission basis and another agreement with the Yexian magnesite mine on the exports of 10,000 tons of recalcined magnesia on a commission basis. In order to ensure the sources of export goods, this company used vehicles, instruments, chemical fertilizer, steel products, timber and other means of production to barter with the mines for their products. By so doing, this company helped the mines solve their problems in production and effectively supported their production.

4. Shandong has circulated funds, paid for the goods in advance and ensured the sources of export goods. The Shandong branches of CEROILFOOD and MINMETALS have adopted this form to acquire export commodities in short supply.

5. Shandong has implemented the contract system, set protective prices and stabilized the sources of export goods. The Shandong branches of CHINATUHSU [China National Native Produce and Animal Byproducts Import and Export Corporation] and CEROILFOOD have negotiated with peasants and fishermen in fixing lowest protective prices for farm and sideline products in short supply such as rabbit fur, prawns and mink. This practice reassures peasants and fishermen and guarantees stable production. It is an effective way to guarantee the sources of export goods.

COMPLETION OF 1985 EXPORT PLAN EXPECTED

Beijing RENMIN RIBAO in Chinese 30 Dec 85 p 1

[Article by Tang Jun [0781 0193]: "Year-end Trade Statistics"]

[Text] By 20 December, yet another number of provinces, municipalities, regions and specialized corporations have joined the ranks of units which overfulfilled this year's export plan ahead of time. On that day, we effectively accomplished 96 percent of our export targets.

According to information provided by relevant sources, seven provinces and municipalities -- Shandong, Jiangsu, Tianjin City, Shanxi, Guangzhou, Gansu and Ningxia -- together with the China National Textiles Import and Export Corporation and the China National Cereals, Oils and Foodstuffs Import and Export Corporation have completed their respective export plans, thus bringing the number of provinces, municipalities and regions with that achievement up to 14 and the number of corporations to 11. Our exports so far constitute 96 percent of total projected exports, an increase of 7 percent over the same period last year.

Reportedly, such exports as grain, cotton, vegetable oil, cotton polyester fabrics, filature silk, jute, gunnysack, tea, fireworks, firecrackers, cultured pearls, paraffin wax and coal have registered exceptionally fast growth.

According to analysis by people concerned, we should be able to complete the 1985 export plan by year end, judging by our current export momentum.

THREE CITIES GEAR UP FOR NEXT YEAR'S EXPORT WORK

Beijing RENMIN RIBAO in Chinese 30 Dec 85 p 2

[Article by Cao Shoujiang [2580 1108 3068]: "Export Statistics on Chongqing, Guangzhou and Shenyang"]

[Text] After completing their 1985 export tasks to earn foreign exchange, the three cities of Chongqing, Guangzhou and Shenyang have lost no time in planning for next year's work to maximize their exports and foreign exchange earnings in the 1st quarter.

Chongqing accomplished its export plan for the entire year as early as early November. But it has succeeded in more than exceeding export targets. In the past, it tended to take things easy at the early part of the year only to have to do a rush job toward the end. With that problem in mind, the municipality instilled the guiding ideology that one must do a good job and accomplish as much as possible in the 1st quarter. Plans were drawn up well in advance and efforts were made to coordinate industry and trade. Currently production and procurement units are carrying out the plan. The aim is to accomplish 20 to 30 percent of the year's targets in the 1st quarter.

Guangzhou completed its export and foreign exchange earnings tasks on 10 December. By that date, they had sold 30.7 percent more than they had at the same time in 1984. On the one hand, they are doing their best to overfulfill this year's plan and export an additional $30 million worth of goods in the remainder of the year. On the other hand, they are preparing feverishly for next year. The end of a year is a peak season for foreign trade procurement and also a time when units are most strapped for funds. Guangzhou vigorously cleared up all kinds of channels, took strong measures to solve certain specific problems, expanded procurement and increased the stocks of those export commodities much sought-after in the market. All this bodes well for exports next year. Incentives are also provided to factories which produce for the foreign markets to make sure that their profits do not drop below those of other factories which produce for the domestic market.

As soon as it accomplished its export tasks in late November, Shenyang threw itself into the preparation of next year's work to increase exports and earn more foreign exchange. Their thrust is directed at the development of new products which will sell well because of their novelty, high quality and inexpensive prices. There are over 100 scientific research units and 220,000 scientific research workers in Shenyang. Technical problems encountered by the municipality in its export drive will be tackled by scientific research units through a bidding system. Of the first batch of 22 projects currently identified, 7 have already been assigned to scientific research units and the others will be dealt with before the year is out. The goals are to have more than half of the municipality's 170 large and medium-sized enterprises produce for the foreign market next year and boost the procurement value of the city's 14 major export commodities to more than 30 percent of overall procurement. The means toward these goals are product development and an export drive.

SHANGHAI EXCEEDS FOREIGN TRADE PLAN GOAL FOR 1985

Shanghai JIEFANG RIBAO in Chinese 3 Jan 86 p 1

[Article by Cao Zhenzhong [2580 2182 0022] and Gao Xiaoxiao [7559 5135 4562]: "Shanghai Fulfills Foreign Trade Targets"]

[Text] Despite such adverse conditions as a depressed international market, slumping export prices and shortages of popular products, Shanghai last year succeeded in fulfilling and even slightly exceeded the foreign trade targets laid down by the state as a result of concerted efforts by foreign trade agencies and other departments concerned. A dozen companies in such areas as textile, apparel, light industry, recreation and sports equipment, mining, livestock, tea leaves and household linens and bedding completed their export tasks ahead of schedule.

That Shanghai was able to accomplish the state plan so successfully is due to several reasons:

First, by strengthening industry-trade coordination, it augmented the supply sources of exports. The availability of watches, tires and bicycles, for example, all has increased to various extents. Procurement within the municipality by foreign trade agencies was valued at 8 billion yuan last year, exceeding the planned target by 5.2 percent.

Policies to encourage export have proved effective in mobilizing enterprises' enthusiasm for selling abroad. After many enterprises carried out such policies in earnest, export supply sources have been going up month after month since last August. From August through November, an average of 720 million yuan worth of goods were procured each month, an increase of 16.4 percent over the monthly average during the January-July period before the policies were implemented.

Third, foreign trade agencies have adopted an array of methods to step up cooperation with other provinces and municipalities, including joint operation of plants, barter trade, appointment of agents, and supporting exports with imports. Through strengthened economic cooperation with sister provinces and municipalities, Shanghai has been able to increase the value of outside supply sources and outside procurement to 2.5 billion yuan, compared to less than 500 million yuan at the beginning of 1985, an increase of 9.36 percent over 1984.

In addition, foreign trade agencies coordinated their moves with industry and actively sought to open up the international market and made endless efforts to clinch foreign deals. They organized trade negotiations, took part in the Guangzhou Trade Fair, sent sales missions abroad, invited businessmen to visit Shanghai and held exhibitions overseas. Almost $1 billion worth of business was concluded at the trade fair last year, the best year ever. Apart from consolidating its markets in Hong Kong, Macao, Europe and the United States, it also took pains to develop barter trade with some countries in Eastern Europe and open up new markets in Latin America and Africa.

Fourth, powerful support by the transportation sector did much to ensure that foreign trade tasks were accomplished. Agencies in charge of the port, piers, municipal transportation and railroads overcame difficulties and did their best to facilitate the outbound shipment of exports. At the port, preference was given to exports over imports and 10 additional berths were made available to rush through the loading of outbound goods. This and other measures have been markedly successful. In terms of tons, outbound cargo handled at the port last December represented an increase of 25 percent over that in November.

FOREIGN TRADE AND INVESTMENT

DEVELOPMENT OF SHANGHAI EXPORT PRODUCTION SYSTEM VIEWED

Shanghai JIEFANG RIBAO in Chinese 4 Jan 86 p 1

[Article by Cao Zhenzhong [2580 2182 0022] and Gao Xiaoxiao [7559 5135 4562]: "Foreign Trade Conference Strategizes To Boost Exports"]

[Text] Shanghai will gradually set up an export production system to ensure that the municipality's foreign trade this year and during the "Seventh 5-Year Plan" will increase substantially and achieve new breakthroughs. This was disclosed yesterday at the 1986 Shanghai foreign trade work conference convened by the municipal people's government.

Vice Mayor Li Zhaoji [2621 5128 1015] attended the conference and addressed the gathering.

At the conference, Vice Chairman Zhuang Yulin [8369 3768 7792] of the municipal Foreign Economic Relations and Trade Commission outlined a plan containing major measures aimed at increasing Shanghai's exports and foreign exchange earnings this year. The thrust will be directed at the establishment of a host of production bases to make agricultural sideline products and factories specializing in the production of industrial goods for export. Both production and export will be geared to the needs of the international market. With that as a basis, Shanghai will gradually put together an agricultural and industrial export production system with Chinese characteristics. Zhuang Yulin said, "This is a major strategic measure to enhance our ability to export and earn foreign exchange under the new circumstances. It is a path we must travel if we are to succeed in export commodity production based on the development level of our productive forces. This year we will begin by examining group by group the 138 key commodities and export factories which account for 74 percent of Shanghai's foreign exchange income, select the best, and draw up a plan as the first step toward shaping Shanghai's export production system."

Zhuang Yulin said, "The port of Shanghai's export plan for 1986 has been drawn up. The municipal CPC committee and people's government demand that our exports this year surpass last year's by 9.4 percent. To make sure that we accomplish this plan and even overfulfill its targets, we must secure the supply of products in heavy demand as well as carry out the research required by the establishment of an export production system. At the same time, industry and trade must coordinate with each other and do whatever is necessary to tap additional supply sources and increase procurement. As far as the opening-up of international markets is concerned, we must conquer new markets in the Persian Gulf region and Southeast Asia in addition to consolidating our existing markets in Hong Kong, Macao, Europe, the United States and Japan. Moreover, we must fight our way into Latin American and African markets. We must also implement economic measures aimed at encouraging export, establish additional economic linkages with sister provinces and municipalities, strengthen the administrative management of foreign trade, reform the foreign trade system vigorously but cautiously, intensify cooperation between foreign trade and transportation agencies, and continuously improve the loading of outbound goods."

Over 1,000 relevant responsible cadres from the municipality's industrial bureaus, foreign trade companies and industrial companies attended the conference yesterday. Also in attendance were leaders from the municipal Economic Commission, the Foreign Economic Relations and Trade Commission, Planning Commission and Communications Office, and officials from the Shanghai office of the Ministry of Foreign Economic Relations and Trade. Chairman Yu Pinfang [6735 0756 2455] of the Shanghai Economic Commission presided over the conference.

SHANGHAI ABSORBS $1.2 BILLION IN DIRECT FOREIGN INVESTMENTS

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 25 Oct 85 p 3

[By reporter Xu Qiuliang [6079 4428 2733]: "A Constant Stream of Foreign Capital Flows Into Shanghai; Twenty Percent Are Investments in Manufacturing Industries; Foreign Capital Absorbed in Third Quarter Is Twice That of First Half Year"]

[Text] Up to the end of September of this year, 141 Chinese-foreign joint ventures, cooperative enterprises and solely foreign-financed enterprises have been approved and set up in Shanghai, absorbing direct foreign investments of almost $1.2 billion.

Guided by the policy of "opening up toward the outside world and invigorating the domestic economy," the progress achieved by Shanghai this year in absorbing foreign capital amounted to a breakthrough. During the period from January to September, 49 Chinese-foreign joint ventures, absorbing $200 million foreign capital, and 27 Chinese-foreign cooperative enterprises, absorbing $530 million foreign capital, were approved and set up in Shanghai Municipality, making a total of 76 cases of direct foreign investments, absorbing $730 million foreign capital. The increases compared to last year were 73 and 114 percent, respectively. Foreign capital absorbed in the 3d quarter of this year amounts to double the amount absorbed during the first half of the year.

Among the 141 Chinese-foreign joint ventures, cooperative enterprises and solely foreign-financed enterprises, 70 enterprises were of an industrial nature, accounting for half of them, and among those that have already started production there are the Shanghai Santana Motorcar Co, a Chinese-West German joint venture, the manufacture of a numerically controlled telephone exchange, a Chinese-Belgian joint venture, and the manufacture of MD-82 passenger planes, a Chinese-American cooperative enterprise. The investments by foreign businessmen concentrate on technology-intensive projects, which is highly significant for the technological transformation in Shanghai during the Seventh 5-Year Plan starting next year, for raising production capacity and thereby also for efforts to catch up with the advanced world levels. This year one-fifth of the foreign investments were made into manufacturing industries.

Starting out from the actual needs of the present, Shanghai Municipality, apart from absorbing foreign capital for the continued construction of large hotels, will be placing its emphasis on productive projects that will increase exports and create foreign exchange revenue. Next year the proportion of foreign capital to be absorbed in the manufacturing industries will be further increased.

SHANGHAI DEVELOPMENT SYMPOSIUM STRESSES FOREIGN CAPITAL USE

Shanghai JIEFANG RIBAO in Chinese 27 Dec 85 p 1

[Article by Di Jianrong [3695 1696 2837]: "Shanghai Urged To Prepare for a New Stage in the Open Door Policy"]

[Text] Shanghai's first "open door policy and development" symposium closed yesterday after 2 days of lively discussions. What impressed one most about the symposium is the conclusion that Shanghai must further liberate its ideas, broaden its vision and hack out a new path in order to open its door and use foreign capital successfully.

During the discussion, many comrades suggested that the open door policy and development are so closely related that they are inseparable. To develop further, Shanghai must continue to pursue the open door policy. Experts and scholars present also explored, on a theoretical plane, such ideas as the use of foreign capital to import technology, achieve technical modernization and update Shanghai's infrastructural facilities; the question of balance in the use of foreign capital by enterprises; and the ability to use foreign capital. Proposals were also put forward for policymakers.

Mayor Jiang Zemin [3068 3419 3046] and adviser to the municipal government Wang Daohan [3076 6670 3211] attended the symposium and addressed the gathering. They said that using foreign capital and doing a good job in export and earning foreign exchange have strategic significance for Shanghai's development. They expressed a desire to work with everybody to examine and study the issues and sum up experience so that when the next stage in Shanghai's open door policy arrives, we will be fully prepared ideologically, intellectually, theoretically and in terms of policy, laws, regulations, working procedures and trained personnel. Pan Weiming [3382 4850 2494], deputy director of the Propaganda Department of the municipal CPC committee, delivered the closing speech.

RENMIN RIBAO SPONSORS FORUM ON JENKINS BILL

Beijing GUOJI SHANGBAO in Chinese 21 Oct 85 p 1

[Article by reporters Li Hongmei [2621 4767 2734] and Zhou Jisheng [0719 4949 0524]: "The Jenkins Bill Evokes Strong Repercussions in Trade Circles--Forum Sponsored by RENMIN RIBAO on the Jenkin Bill Now Being Considered by the U.S. Congress"]

[Text] On 7 October, the editorial department of the RENMIN RIBAO sponsored a forum on the Jenkins Bill and the restriction of textile imports now being considered by the U.S. Congress. Responsible persons from a dozen import and export companies which do a great deal of trade with the United States and other personages from trade circles attended the forum. The participants at the forum unanimously held that this bill violates the multifiber agreement and the Sino-U.S. trade agreement and that if it is passed, it will seriously impair Sino-U.S. trade development and its results will be quickly reflected in China's import and export trade with the United States.

Wang Zhenhua [3769 2182 5478], general manager of the China Petrochemical International Enterprise Corporation, said: My company imports a large amount of raw materials of chemical fiber, technology and production equipment from the United States. If the United States puts restrictions on China's textile exports, it will directly affect our company's exports and then our ability to pay for our imports, resulting in serious consequences in petrochemical trade between the two nations.

Zhu Dazhi [2612 6671 1807], deputy general manager of the China National Chemicals Import and Export Corporation, pointed out: In the past few years, we have paid great attention to developing trade with the United States. In 1984, our company imported over $900 million of U.S. commodities, an increase of 258-fold over 1973. We hope that the U.S. side would not create man-made obstacles in the development of bilateral trade.

The representative of the China Civil Aviation pointed out: China has just imported many U.S. airplanes. According the needs of civil aviation, China will import many more airplanes in the "Seventh 5-year Plan" period. If the Jenkins Bill is passed, China's trade deficits with the United States will increase further and directly affect China's ability to pay for its imports. As a result, we would have to reconsider the arrangement for imports.

Yu Liancheng [0060 6647 2052], deputy chief engineer of the China Electronics Import and Export Corporation, said: Textile and other kinds of trade belong to the same entity. Limiting China's textile and clothing exports will directly affect China's ability to pay for its imports. If the Jenkins Bill is passed, we would be forced to readjust and reduce the items of our import from the United States.

Huang Jianmo [7806 1696 6206], deputy general manager of the China Silks and Satins Corporation, said: The Jenkins Bill has seriously violated the multilateral textile agreement and the Sino-U.S. Trade Agreement. In violation of the Sino-U.S. trade agreement, the United States unilaterally adopted restrictive measures and expanded the scope of restriction. This is a trade discrimination policy. We cannot accept it. Especially, the United States does not have a silk industry and cannot even find an excuse of "protecting industry;" therefore, limiting our silk imports is sheer discrimination. We strongly oppose this bill.

The representative of the China Textiles Import and Export Corporation, said: Our opposition to this bill is very obvious. Our company not only exports textiles and clothing to the United States but also imports raw materials of synthetic fibers from the United States. The direct consequence of U.S. restrictions on textile and clothing imports is plain to see.

The representatives of the China Native Produce and Animal Byproducts Import and Export Corporation, the China Instruments Import and Export Corporation and the China Technology Import Corporation and some personages in trade circles also expressed serious concerns and strong objections to this bill.

MOFERT ON STRICTLY CONTROLLING QUALITY OF IMPORTED GOODS

Beijing GUOJI SHANGBAO in Chinese 30 Sep 85 p 1

[Article by Lin Guihua [2651 2710 5478]: "Answering Questions from a Reporter of this Newspaper, a Person in Charge of the Foreign Trade Administration Bureau of the Ministry of Foreign Economic Relations and Trade Pointed Out that the Quality of Imported Commodities Must Be Strictly Controlled."]

[Text] Recently, this newspaper carried several consecutive reports on occurances of inferior quality imports,arousing public interest at home and abroad and attracting the attention of government agencies concerned.This reporter interviewed a person in charge of the Foreign Trade Administration Bureau of MOFERT on some of the problems of mass concern.

Q: How do you evaluate our news reports of several incidents involving the import of inferior quality commodities?
A: In the course of importing general merchandise, it is normal that some inferior quality goods occasionally come in and that claims are subsequently filed. But there shouldn't be any problems with the quality of high technology imported goods. The problems with products such as `Orion' color televisions and Mitsubishi FP418 heavy duty trucks are rare in international trade. The `Guoji Shangbao' investigated, and factually reported and exposed these problems, helping to press for a solution and urging buyers and sellers to face the problems and adopt remedial measures. This is valuable assistance to buyers and sellers and in future will foster better cooperation.

So far this year, the country's import trade has expanded rapidly; imports from Japan, especially, have posted large increases.Paralleling this increase has been a sharp rise in imports of inferior quality products, which infringe on the rights and interests of Chinese consumers, inevitably arousing the attention and concern of agencies involved.
Q: Imported `Orion' color televisions and Mitsubishi heavy trucks were found to be of inferior quality. How do you propose to handle these cases?
A: After the problems were discovered, MOFERT issued a notice to concerned import corporations and user units, requesting implementation of a full fledged inspection on all imported items and adoption of timely corrective measures. Realizing that the underlying cause stemmed from the poor quality of the imported products themselves,resulting in heavy economic losses for all government agencies concerned and for consumers, we feel that the exporters must make up for the losses according to established international trade practices and stipulations in the contracts signed by both parties.

We hope that these problems can be settled quickly in an appropriate and reasonable manner.The corporations involved should also draw a lesson from these incidents.

Q: How can the problem of importing poor quality goods be prevented from happening again?

A: This requires a mutual effort on the part of importers and exporters. First, exporters should back their products, and products should be able to pass inspections and quality appraisals. Our import corporations must approach work with an attitude of deep responsibility toward the country,the end users and the rights and interests of consumers; before signing import contracts,thoroughly investigate and research exporters' credit and product quality,and get an effective hold on the quality of imported products to prevent shoddy workmanship and the switching of good import products for bad ones; when contracts are signed, make sure provisions have clear, precise and strict stipulations on such items as product quality, inspection and claim procedures; and after shipments arrive,promptly ask state commodity inspection units to perform quality inspections or reinspections. Once a problem is discovered, promptly file a claim to the exporter to recover economic losses. Import administration units must strengthen control over examination and approval of import commodities; commodity inspection units must rigorously carry out quality control work. Import of all higher technology products which state commodity inspection units determine do not meet state quality and safety standards will not be permitted.

To strengthen control over quality of import products, MOFERT, the Ministry of Commerce and the State Commodity Inspection Bureau have jointly formulated "Provisional Regulations on Inspection of Imported Home Electrical Appliances," and in future will formulate other relevant provisions as required. The Foreign Trade Administration Bureau of MOFERT,functioning as the management arm for import and export trade of the entire country, plans to strengthen control over import commodities by: 1) insisting on centralized and joint purchasing for large quantities ofimport commodities, the import of categories of large quantity commodities such as automobiles requiring centralized purchasing; 2) rigorously examining and approving import permits; and 3) requiring all importing units to strictly implement state commodity inspection regulations; all imported commodities must be inspected within a specified time, and those not inspected will not be permitted to be installed, put on line, sold or utilized.

FOREIGN TRADE AND INVESTMENT

ECONOMIC RELATIONS WITH HONG KONG INCREASINGLY 'INTIMATE'

Fuzhou FUJIAN RIBAO in Chinese 19 Dec 85 p 3

[Article by Huang Yue [7806 6390]: "Review of Chinese-Hong Kong Economic Relations Over Past Year"]

[Text] December 19, 1985 marked the first anniversary of the formal signing of the Chinese-British joint declaration on Hong Kong. During the past year, Hong Kong and the mainland have developed even more intimate relations as they supplement each other economically. Both are moving in the direction of prosperity.

New Developments in Trade Relations

Two-way trade between Hong Kong and the mainland in the first 9 months of this year totaled $87.8 billion [Hong Kong dollars] (all data in this article are Hong Kong statistics), an increase of 33 percent over the same period in 1984, and accounted for more than one-quarter of Hong Kong's foreign trade. China has become Hong Kong's No 1 trading partner.

Hong Kong exports to the interior, negligible a few years back, have been expanding continuously in recent years as a result of China's open door policy, uninterrupted economic growth and its people's rising living standard. Hong Kong's entrepot trade with China has also been going up. The signing of the Chinese-British joint declaration has opened up broad vistas for two-way trade between Hong Kong and the mainland. From January through September, Hong Kong exported to China a total of $11.5 billion [Hong Kong dollars] worth of goods, 54 percent more than the same period last year. Meanwhile, transit goods destined for China via Hong Kong more than doubled to $35.58 billion [Hong Kong dollars].

Rising protectionism in the United States and an economic downturn in Europe have resulted in sagging markets for Hong Kong exports this year. As Hong Kong exports to those places shrank, only its trade with China registered an increase, a development which helped cushion the adverse impact of declining exports.

The Chinese mainland has consistently exported more to Hong Kong than it imported. This year, however, it ran up a deficit in its trade with the colony. Nevertheless, the mainland remains the largest source of Hong Kong imports, selling merchandise worth $40.76 [Hong Kong dollars] billion to it, exceeding even those from Japan.

Expanding Business With the Interior

As Hong Kong's future became clear following the signing of the Chinese-British joint declaration, international financial institutions with offices in Hong Kong have been seeking to expand their business to China, one after another. The International Commercial Credit Bank, Citibank, N.A., Hang Seng Bank, Chase Manhattan Bank, the Chartered Bank, the Bank of Belgium and Huabi [5478 3024] Bank have successively set up branches or offices in special economic zones, or open cities this year. A good number of foreign banks have expanded the scope of their operations in China from consultation to lending, deposit-taking and foreign exchange remittances. The Hong Kong and Shanghai Banking Corporation alone has extended credit to more than 200 projects in the interior. The International Commercial Credit Bank has been helping the interior open up markets in the Middle East and Africa, and import advanced technology and equipment from countries in Europe and the United States. Hong Kong banks have made loans worth more than $3 billion [Hong Kong dollars] to mainland projects so far this year, about 1.5-fold of what they loaned in 1984.

Even more corporations from around the world opened shop in Hong Kong in 1985 to gear up for the China market. In a notable move, Wang Laboratories, Inc. recently moved its Asia-Pacific headquarters from Hawaii to Hong Kong. Zhi Lin Engineering Co., a member of the British firm of Wei Dang Co., hopes to provide electrical engineering technology to the interior from its base in Hong Kong. Eight well-established French companies have also opened offices in Hong Kong and already concluded several contracts with the interior for cooperation in the food industry.

This year also saw another gratifying phenomenon. In the past, Hong Kong manufacturers who invested in the interior were quick to remit their profits to Hong Kong. Nowadays some investors are plowing back into their business in China the profits they have earned there.

Growing Mainland Investments in Hong Kong

At the same time as Hong Kong is investing heavily in the interior, there is a reverse and expanding flow of capital into the colony. Mainland investments in Hong Kong can be found in such areas as finance, real estate, shipping, transportation, industry, trade, construction, department stores, publishing and printing, to name a few. According to Hong Kong Trade Development Council estimates, Chinese investments in Hong Kong in recent years amounted to $30 billion [Hong Kong dollars].

The Bank of China Group has become a force vital to the stability and prosperity of the Hong Kong economy. The group embarked on an extensive round of lending this year to support industrial and commercial developments. Its targeted lending to industry, in particular, has boosted the competitiveness of Hong Kong industry. When turbulence hit the financial market, moreover, it acted to preserve the stability of the Hong Kong market in concert with the Hong Kong government by buying and selling foreign exchange and through other financial transactions.

Together with its subsidiary companies and enterprises, China Resources (Holding) Co., Ltd., touted as the mainland's "flagship" company in Hong Kong trade, has been successfully diversifying its operations from trade into such disparate fields as industry, shipping, warehousing and general merchandising. The China Merchants Steam Navigation Co has expanded into a holding company with almost 200 subsidiaries and affiliated concerns. Recently the Hong Kong China Travel Service has also reorganized as a holding company with an expanded scope of operations.

Since the beginning of this year, trade organizations have been set up in Hong Kong by a number of provinces and municipalities which have never done so before. Besides trade, these organizations also engage in other forms of economic cooperation. For instance, Shenzhen's Shenye Holding Co., Ltd. is sinking $600 million [Hong Kong dollars] into a joint venture with Japanese interests to build a hotel in Hong Kong. The Huamin Holding Co. of Fujian is investing in real estate, industry, finance, tourism and restaurants, etc.

To meet Hong Kong's needs, a number of industrial and mining enterprises in the mainland began setting up plants in Hong Kong as joint ventures in 1985. This will be a step forward for Hong Kong industry.

INCREASE IN HONG KONG-MAINLAND COOPERATION EXPECTED

Hong Kong JINGJI DAOBAO [ECONOMIC REPORTER] in Chinese No 46, 18 Nov 85
pp 6, 16

[Article by Huang Diyan [7806 3321 1484], director of the Hong Kong and Macao Administrative Office of the Bank of China: "China's Blueprint for the "Seventh 5-year Plan" and Economic Cooperation Between Hong Kong and the Mainland"]

[Text] On 23 September 1985, the National Conference of Party Delegates of the Communist Party of China adopted the "Proposal of the Central Committee of the Communist Party of China for the Seventh 5-Year Plan for National Economic and Social Development." This proposal has not only drawn up a magnificent blueprint for China's economic and social development from 1986 to 1990 but also provided a new prospect for the development of economic cooperation between Hong Kong and the mainland.

Since the 3d Plenum of the 11th CPC Central Committee, at the end of 1978, set forth the policy of invigorating the domestic economy and opening to the outside world and since reform of the economic structure was carried out in 1984, China's economic appearance has undergone vast and profound changes. The original outdated economic model unsuitable for the productive forces of society is now being gradually replaced by a new economic model and a new lively situation has been created in China's national economy. Industrial, trade, tourist, and financial relations and cooperation between Hong Kong and the mainland have developed substantially and become a new motive force for Hong Kong's economic prosperity and development. In the past 6 years, the total value of trade between the two areas increased 7.8-fold, an average of 43.6 percent per year. Of this, Chinese goods shipped to Hong Kong increased 4.3-fold, an average increase of 32 percent per year; Hong Kong goods shipped to the mainland increased 138.3-fold, an average increase of 1.28-fold per year; and foreign goods shipped to the mainland via Hong Kong increased 130.1-fold, an average increase of 1.25-fold per year. Investment cooperation between the two areas has also developed very rapidly. Hong Kong has agreed to invest a total of $6.69 billion on the mainland. The proportion of pledged Hong Kong investment in the total amount of pledged foreign investment in China reached 57.9 percent in 1983. By 1984, it climbed to 62.8 percent. Organizations on the mainland and Chinese enterprises located in Hong Kong have continued to increase their investment in Hong Kong. According to the statistics of the Hong Kong Trade Development Bureau, the total amount of such investment is HK$30 billion. Hong Kong banks have granted a considerable amount of funds in loans for the construction projects of the mainland. In 1984, the Chinese banking group signed more than 500 investment agreements for the construction projects of the mainland and provided HK$4.1 billion of funds, equivalent to 1.6-fold of the sum total of the previous 4 years. Other banks have also paid more and more attention to the China market. Some set up branch offices in China as early as 1979. In the past 6 years, they have provided for foreigners investing in mainland China a huge amount of funds in loans to cover hundreds of investment projects. According to incomplete statistics, since the begining of 1985, Hong Kong banks have raised over HK$3 billion in bank loans for the investment of projects in mainland China, approximately 1.5-fold of 1984's figure. In addition, since the promulgation of "the Regulations for the Control of Foreign-Funded Banks and Sino-Foreign Joint Venture Banks in Special Economic Zones," the Hong Kong Exchange Bank, the Oriental Exchange Bank, the International Commercial Credit Bank and the Standard Chartered Bank have been approved to set up branch offices in Shenzhen SEZ. The Pan-Indian banking group has joined investment with mainland China to organize the Xiamen International Bank in Xiamen SEZ and extend direct local services.

"The Proposal for the 'Seventh 5-Year Plan'" has extended and consolidated various important economic policies and measures implemented in China and stressed the need to continue to strive to meet the general demand for building socialism with Chinese characteristics, to implement the general principle of invigorating the domestic economy and opening to the outside world and to help the people in China become comfortably well-off by the end of this century. Based on the conception of the "proposal," during the "Seventh 5-year Plan" period, China will give top priority to the reform of the economic structure, eliminate age-old malpractices that restrict productive forces, push to a new stage the all-around economic structural reform centered in urban areas, suit the reform to construction and make them support each other; achieve a basic balance between aggregate social demand and supply and enable accumulation to maintain a proper ratio to consumption; pay special attention to improving economic results, especially the quality of products, correctly handle the relations between quality and quantity and between results and speed; and vigorously strengthen the building of socialist ideological civilization while promoting the building of material civilization. With regard to foreign relations, the "proposal" reiterates that opening up is China's basic national policy. During the "Seventh 5-year Plan" period, China will, in accordance with the principle of independence, equality and mutual benefits, further strengthen economic and trade relations and technological exchanges with all countries including developed and developing countries, continue to relax control and give more preferential treatment for foreign investments.

It is expected that along with the implementation of China's "Seventh 5-year Plan" and the steady development of the economy, economic ties between Hong Kong and the mainland will become closer and closer, bringing about a new situation of steady expansion.

The "proposal" suggests that during the "Seventh 5-year Plan" period, China give better play to the role of forward positions in opening to the outside world. This enables Hong Kong to continue to take advantage of its favorable location.

During the "Seventh 5-year Plan" period, China's special economic zones, coastal open cities, the Zhujiang and Changjiang deltas, the triangular area in southern Fujian and the Liaodong and Jiaodong peninsulas will shoulder an extremely important task in developing foreign trade, using foreign capital and importing technology. Its main point is to readjust the industrial lineup according to export needs and enable more competitive commodities to enter the international market. While vigorously importing technology, special economic zones will gradually shift the focus of production to exports and strive to earn more foreign exchange. Guangdong and Fujian, in particular, will continue to implement special policies and flexible measures. The latest development is that in order to encourage more overseas Chinese and compatriots from Taiwan, Hong Kong and Macao to invest in the mainland, Fujian Province will give many kinds of preferential treatment regarding taxes, profits and land fees. One of the preferential treatments is to exempt enterprises established in areas other than economic and technological development areas from income taxes for 3 years after they begin to make profits. In the remaining years, they may enjoy other kinds of reductions and exemptions. Guangdong Province has also approved that scores of major industrial satellite towns in the Zhujiang delta may enjoy many kinds of preferential treatment in opening to the outside world, including the exemption of customs tariffs, import duties and appreciation tax for the imports of advanced equipment and other kinds of tax exemption or reduction for joint ventures and cooperative enterprises. Following this, many special policies and flexible measures will continue to increase. It is expected that under the condition that the central government vigorously supports regions in opening up to the outside world, foreign investment will be needed in many aspects of industry, trade, transportation, finance and other sectors. Hong Kong is the south gate of China. It is close to open zones. It also has relatively good economic foundations and facilities. Its favorable position cannot be compared with other countries or areas. Hong Kong's industrial and commercial circles should, on the existing basis, further strengthen cooperation relations with the special economic zones and open cities of the mainland and, in accordance with the development plans of special economic zones, gather foreign capital of all kinds, choose a correct orientation of investment and seek more opportunities for development.

The "proposal" suggests that during the "Seventh 5-year Plan" period, China strengthen the technological transformation, reconstruction and expansion of existing enterprises and arm all sectors of the national economy with advanced equipment and technology. This is conducive to further strengthening industrial and trade cooperation between Hong Kong and the mainland.

According to the assumptions of the "proposal," during the "Seventh 5-year Plan" period, the technological transformation of China's enterprises will be focused on large- and medium-sized enterprises which have a bearing on the overall situation of the national economy, back-bone enterprises which, after being revamped, can play an exemplary role in the technological progress of their industry, as can enterprises which have export tasks. Judged from the development of the situation, China's industrial production from now on will to a very great extent depend on the technological transformation of existing enterprises. Through technological transformation, existing enterprises will be able to produce high-quality products more economically and efficiently to meet market needs and reduce reliance on the direct importation of consumer goods. At the same time, in the course of importing advanced technology and managerial experience, investment will be focused on the production of export commodities that can earn more foreign exchange to coordinate enterprises in achieving two changes in the lineup of export commodities--from mainly exporting primary products such as raw materials to mainly exporting finished products and from mainly exporting products of rough processing to mainly exporting products of fine processing. This will help to continuously improve product quality, upgrade original products, develop new products, push more products into the international market and increase the ability to earn foreign exchange. The technological transformation, reconstruction and expansion of China's enterprises and changes in the production lineup of export commodities will provide new opportunities for investment cooperation and trade with businessmen of foreign countries and Hong Kong. As far as Hong Kong businessmen are concerned, there are at least three good opportunities: 1) They can cooperate with old enterprises on the mainland. They can take advantage of their relatively abundant foreign exchange funds, relatively high technological and managerial levels, relatively wide export markets and quick access to information to help the old enterprises of mainland China carry out technological transformation, reconstruction or expansion projects. At the same time, they can also take advantage of the abundant labor and material resources and broad markets of the mainland to break through the limitations on the industrial development of Hong Kong. 2) In accordance with the needs of mainland enterprises for expanding production and upgrading technology, they can strive to import more factory machinery, technological software and auxiliary equipment for the mainland. 3) They can help the mainland improve product quality, develop new products, enter the international market and continue to maintain Hong Kong's role as an entrepot for products made in China.

The "proposal" suggests that during the "Seventh 5-year Plan" period, China should strive to use, through all forms, as much foreign funds as possible to speed up China's economic construction. This is conducive to further strengthening financial ties between Hong Kong and the mainland.

According to the assumption of the "proposal," during the "Seventh 5-year Plan" period, more foreign commercial loans should be used for economically better developed regions and projects that can yield good economic results, earn more foreign exchange or turn out products to replace imported goods. As the third largest financial center of the world, Hong Kong should be able to play a better role in raising and circulating funds for the mainland. It is certain that from now on, financial ties between Hong Kong and the mainland will be further expanded and pluralized. The number of financial organizations and enterprises on the mainland using the capital market of Hong Kong to pool and circulate funds will increase as each day goes by. And so will the variety of forms for pooling funds. The number of Hong Kong's financial enterprises establishing branch offices in the special economic zones and open cities of the mainland and the number of financial service organizations jointly established by Chinese and foreign investors will also increase gradually.

To sum up, in the next 5 years, along with the implementation of the "Seventh 5-year Plan," China's national economy will witness a new situation of steady development and make new strides on the road toward a strong and prosperous nation with a wealthy and happy people. The development of the economic situation of the mainland will inevitably tighten economic cooperation and ties between Hong Kong and the mainland and therefore continue to cause positive effects on Hong Kong's economic development in the next 5 years. Hong Kong's entrepreneurs who are always known for their ambition, sensitivity, adaptability and hard work ought to be able to seize the good opportunity and, based on the information provided by the "proposal for the 'Seventh 5-year Plan'" and in accordance with their own concrete conditions, readjust business strategies, vigorously open up new fields and find new ways of cooperation between the two areas, create a new situation in China's business development and make contributions to economic development of both areas. In the future, the Chinese banking group will, in light of the implementation of China's "Seventh 5-year Plan," make still greater efforts to continuously accelerate the economic cooperation between the two areas and maintain the prosperity and stability of Hong Kong. At the same time, we hope that the special economic zones, open cities and concerned enterprises of the mainland make better use of this nearby international trade, financial and information center of Hong Kong and give full play to Hong Kong's positive role in expanding foreign economic relations and trade and technological exchanges.

FOREIGN TRADE AND INVESTMENT

DALIAN'S TECHNOLOGICAL IMPORTS PAY OFF

Beijing RENMIN RIBAO in Chinese 30 Dec 85 p 1

[Article by Yan Xichen [3508 1119 2525]: "Dalian's Drive To Import and Assimilate Technology"]

[Text] Measures introduced by Dalian to import advanced technology and encourage enterprises to absorb and assimilate it have produced satisfactory results.

Since 1979, the municipality has imported almost 400 pieces of technological equipment to modernize its enterprises, of these 180 pieces have been completed and put into production so far. Through concerted efforts by the factories, scientific research units and colleges and universities concerned under the joint direction of the municipality, 76 projects have been absorbed, assimilated and popularized to varying degrees. Of the 380 new products developed by Dalian, about half reach or approach the technical standards of similar foreign products, and fill a technical vacuum in the nation.

Essentially Dalian absorbs and assimilates imported technology in the following ways:

First, joint production. By importing a complete set of technological equipment, enterprises have been able to come up with new products within a short period of time. This method made it possible for Dalian Heavy Machinery Plant to develop, little by little, in just a short time a small-scale continuous casting system up to a standard comparable to that of its international counterparts. Other factories concerned have successfully trial-manufactured over 80 large-scale new products like a diesel engine for low-speed ships, oil-drilling platforms, revolving hanging cranes and a bimetal hydrophobic valve.

Second, use imported prototypes as a model, and innovate; the idea being to surpass the original. Starting with a few relatively simple products and then moving on to more sophisticated ones, Dalian has absorbed the technology and models it imported and created new products out of them. This process requires little capital and produces good and speedy results.

Third, take the good points of imported equipment and use them to remedy the shortcomings in existing facilities.

Fourth, import only key technology and develop our own software.

In organizing the absorption and assimilation of imported technology, Dalian has taken pains to coordinate the relations between units which import technology and others which manufacture parts and components. When the project in question is complex and involves several units, the authorities concerned bring together every interested party to tackle it jointly. To support the absorption and assimilation of imported technology, Dalian has formulated a set of policies relating to tax, loans, prices and incentives. In terms of management, the municipality has implemented a contracting system and economic contracting responsibility system to make sure that projects which have been assimilated are really put to use. These measures have given the assimilation of imported technology a powerful push.

CHEMICAL INDUSTRY URGED TO INCREASE EXPORTS

Beijing RENMIN RIBAO in Chinese 30 Dec 85 p 1

[Article by Li Hongmei [2621 4767 2734]: "Chemical Industrial Trade Grew Rapidly in 'Sixth 5-Year Plan'"]

[Text] Chemical industrial exports will grow 19 percent per year during the "Seventh 5-Year Plan." The aim is to export 1.05 million tons of chemical products by 1990. At the same time, major efforts will be made to step up the export of chemical industrial equipment and technology, expand labor cooperation and intensify bidding for engineering projects. We will also try to use foreign capital and import and digest technology successfully. The amount of foreign capital to be attracted under the "Seventh 5-Year Plan" is expected to double that under the "Sixth 5-Year Plan."

Those words were spoken by Lin Yincai [2651 3009 2088], vice minister of chemical industry, at the national chemical industrial imports and exports conference.

Referring to the performance of the Ministry of Chemical Industry in foreign economic relations during the "Sixth 5-Year Plan" period, Comrade Lin Yincai said, "According to incomplete data, chemical industrial exports and imports may reach $19.9 billion, up 70 percent over the 'Fifth 5-Year Plan' period. A total of 466 pieces of advanced foreign technology and key equipment were imported, including over 300 midsized and small projects. More and more of the imports are being used to modernize existing enterprises. The methods of import are becoming increasingly diverse and the list of supplier nations is also lengthening. The digestion and assimilation of imported technology, too, is beginning to pay off. During the last few years, the ministry assimilated the technology of the advanced equipment which we imported to make large-scale synthetic ammonia, urea, petrochemicals and chlorine alkaline, among others. In some cases, we are now able to manufacture our own equipment. For instance, after digesting and assimilating the imported technology, we designed and manufactured, on our own, equipment capable of producing 60,000 tons of synthetic ammonia a year. The equipment is now sold abroad in complete sets. As far as project contracting, labor cooperation, the export of single pieces of equipment and processing with foreign materials are concerned, we have been in touch with over 60 companies in 20 nations. The use of foreign capital and other forms of economic and technical cooperation have also borne fruit."

Lin Yincai said, "During the 'Seventh 5-Year Plan,' we must firmly adhere to the goals of reform, the open door policy and economic invigoration; give top priority to the improvement of economic results, particularly the improvement of product quality, in order to increase our exports and foreign exchange earnings. We must vigorously open up new international markets, expand labor cooperation; make use of foreign capital and imported technology, and further broaden all kinds of external economic and technical cooperation. Simultaneously, we must enhance our ability to digest and assimilate imported technology, and come up with inventions based on them to speed up the modernization of China's chemical industry."

Lin Yincai pointed out, "To expand exports, we must step up quality control. In the future, all enterprises assigned export tasks must adopt international standards or advanced foreign standards in their production. Moreover, we must work hard to improve packaging and make it scientific, standardized and systematic." He emphasized, "The key to increasing exports and boosting foreign exchange income is to secure stable supply sources. Consequently, it is extremely important that we accelerate the construction of an export production system of chemical industrial products and equipment. We must select a group of well-established and well-qualified factories and mines to be export bases. The fuel, energy and raw materials requirements of enterprises producing for the foreign market should be given priority. So should technical modernization projects which will increase exports, earn more foreign exchange and produce better economic results. Whenever there is a conflict between export and domestic sales, the latter should yield to the former."

Lin Yincai said finally, "Today our chemical industry already has some rather sophisticated technologies and processes which reach international standards and can compete in the world markets. We must build up an international reputation, increase our impact and try endlessly to bring out new exports and boost foreign exchange earnings."

SHARP INCREASE IN NATIVE PRODUCE, ANIMAL BYPRODUCT EXPORTS

Beijing RENMIN RIBAO in Chinese 30 Dec 85 p 1

[Article by Liang Shiyu [2733 0013 3842]: "Native Produce and Animal Byproduct Exports Grew Strongly Under the 'Sixth 5-Year Plan'"]

[Text] During the "Sixth 5-Year Plan," the export of China's native and animal husbandry products has been markedly successful, it has been learned from the recent managers' meeting of the China National Native Produce and Animal Byproducts Import and Export Corporation. Native produce and animal byproduct exports and imports amounted to $14.9 billion, an increase of 75 percent over the "Fifth 5-Year Plan" figure of $8.5 billion. Exports accounted for $11.7 billion of the total, up 56 percent over exports in the "Fifth 5-Year Plan." They constituted 10.15 percent of all Chinese exports.

Deputy General Manager Chen Shulan [7115 3219 5695] told reporters, "Since the beginning of this year, Western capitalist economies have slowed down and the international market for native produce and animal byproducts continues to weaken. Within the country, the restructuring of the economic and trade systems is under way and there are areas in which we are not keeping up with the pace of reform, managerially. All this has posed definite problems for the completion of the export plan. Under the correct leadership of the higher authorities, however, the army of workers in the native produce and animal byproducts sector has made concerted efforts to accomplish the plan. As of early December, exports in effect reached $2.392 billion, $85 million more than what was exported by early December a year ago."

Chen Shulan said, "Some gratifying changes have occurred in the composition of China's native produce and animal byproduct exports under the 'Sixth 5-Year Plan,' primarily the shift from raw materials to manufactured products and the development of new products for export. Vast quantities of down goods and rabbit furs are now entering the international market." The deputy general manager said, "The corporation will firmly uphold the policy of unified export, raise product quality and improve services to make sure that next year's export plan is fulfilled." She said, "Apart from further consolidating and expanding our markets in Hong Kong, Macao, Japan, the European Economic Community and the United States, we will devote ourselves to tapping new markets, especially those in the Soviet Union and Eastern Europe."

PREFERENTIAL TREATMENT FOR FOREIGN INVESTMENT IN NEI MONGGOL

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 28 Nov 85 p 1

[By He Qi [0735 0366]: "Nei Monggol Will Give Preferential Treatment to Foreign Investments"]

[Text] Bai Junqing [4101 0193 0615] (Monggol nationality), vice chairman of Nei Monggol Autonomous Region, will lead a government delegation in a visit to Hong Kong within the next few days and attend the Nei Monggol Economic and Technological Project Announcement Meeting scheduled to be held in early December.

Prior to departure, Bai Junqing told reporters that the purpose of holding the announcement meeting was to seek further economic and technological cooperation with the industrial and commercial circles of foreign countries and the Hong Kong and Macao area. He said that the meeting will announce 54 cooperation projects of such industries as farm and animal products processing, building materials, electronics and machine-building.

He said that in order to welcome foreign businessmen to invest in Nei Monggol, the autonomous region recently formulated preferential conditions for foreign economic and technological cooperation.

It is reported that fees and charges on various enterprises established by foreign businessmen in Nei Monggol are 30 to 50 percent lower than those in coastal cities; labor payment for building various enterprises is 10 to 20 percent lower than that for building similar enterprises in other provinces and municipalities; in addition to income tax exemption and reduction specified in the state law on the income tax of wholly-owned foreign enterprises and joint ventures, cooperative enterprises may continue to enjoy 15 to 30 percent of income tax reduction in the next 10 years, according to the reality of Nei Monggol; wholly-own foreign enterprises or cooperative enterprises may be exempt from some taxes if their annual profits are less than 1 million yuan; and foreign businessmen may remit foreign exchange profits as their lawful income to foreign countries through the branch office of the Bank of China in the autonomous region.

Bai Junqing said that compatriots from Taiwan, Hong Kong and Macao and overseas Chinese will enjoy more preferential conditions than those stated above when they come to invest in Nei Monggol.

He said that in the past 7 years, Nei Monggol has received hundreds of businessmen from more than 20 countries and the Hong Kong area, and attracted $50 million in foreign capital by signing 26 economic and technological contracts in the forms of joint venture, cooperative enterprises, rents and leases.

BRIEFS

COTTON EXPORTS TO POLAND RESUME--In the 1950's, China once exported cotton to Poland. Later on, because domestic demand increased and production fell behind, China became, and remained,a cotton importing country for many years. As a result, China's exports to Poland was suspended. This year, China resumed cotton export to Poland for the first time after it was suspended for 30 years. Poland is very interested in and attaches great importance to cotton imports from China. A representative of the Poland Textiles Corporation, who went to China in February this year to sign a cotton contract, said: "Polish consumers are very satisfied with the quality of Chinese cotton. The strong points of Chinese cotton are thin fiber, evenness, high intensity and little impurities. Its only weakness is bulky light-weight packaging." The vice chairman of the Polish cotton association said that due to a limited processing capacity, Poland's annual demand for cotton will remain at about 150,000 tons, of which, 20,000 to 30,000 tons may be imported from China. Poland wants to buy 3,000 tons of long-fiber cotton in addition to medium-fiber cotton. Besides, Poland also wants to purchase a considerable amount of cotton yarn and unfinished cotton. (According to published statistics, Poland imports about 6,000 tons of cotton yarn every year, mostly from the West, and 11,000 square meters of unfinished cotton, two thirds from the West.) GUANGXI OVERFULFILLS EXPORT QUOTA--By 10 November 1985, Guangxi Zhuang Autonomous Region had already overfulfilled its annual export plan, recording a 15 percent increase over the corresponding period of 1984 and an all-time high in history. In 1985, the state properly readjusted the ratio of foreign exchange earnings from exports to be retained by Guangxi, thereby arousing the enthusiasm of all export goods supply units for earning foreign exchange. Now Guangxi exports more than 2,500 kinds of commodities. [Text] [Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 21 Nov 85 p 1] 12302

SPECIAL ECONOMIC ZONES

FINANCIAL TASKS OUTLINED FOR SHENZHEN SEZ

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 12, 4 Dec 85 pp 48-49

[Article by Wang Xiyi [3769 0823 5030]: "The Financial Situation and Proposals for the Current Work of the Shenzhen Special Economic Zone"]

[Text] The Financial Situation and Characteristics of the Shenzhen SEZ

At present, the financial situation of the Shenzhen SEZ has the following characteristics:

1. Finance is the main pillar of construction in the SEZ. This is demonstrated in the following areas: 1) With regard to the proportion of bank loans in the economic construction funds of the SEZ, fixed-asset loans accounted for over a third by the end of 1984 and circulating fund loans accounted for over 80 percent of the total circulating funds of enterprises. 2) The SEZ has established a financial system consisting of four categories of financial organizations--state banks, which occupy a dominant position, non-bank financial institutions, foreign banks, and collectively-owned credit cooperatives--each exercising functions in a different field. 3) Banks in the SEZ have developed many kinds of financial services. For instance, they have issued developmental loans to support the construction of industrial, tourist, and commercial districts; offered loans for investments in the form of partnership; initiated commercial housing loans to accelerate the commercialization of housing in the SEZ; issued loans for the imports of advanced technology and equipment to help transfer Shenzhen's economy to an export-oriented economy; organized domestic financial institutions or joined efforts with foreign banks to issue loans as a banking group; and offered such services as mortgage loans to enterprises owned by foreigners, by overseas Chinese, or jointly by Chinese and foreigners. 4) The SEZ has started many businesses through banks, summed up and accumulated experiences, developed modernized financial services, gradually created a good environment for investment, and absorbed more foreign funds.

2. The funds of the SEZ are diversified and changeable. They include local investment, joint investment with concerned departments at various levels, and foreign investment. They also include state appropriations, credit funds, and enterprises' self-owned funds. Some funds belong to the state; others belong to the collectives and individuals. The diversity of the funds makes the funds

useful in different fields and under different circumstances. It has also broadened the range for banks to circulate funds through the means of credit. However, we should also notice that the funds of the SEZ vary constantly. This is because compared with other areas in inland China, the SEZ has more joint investment with inland China and foreign investment; therefore, it is more affected by the economic situation of inland China and foreign countries. Banks are also subject to more influence and changes when they circulate funds in this regard. We must face the fact that the credit funds of the SEZ vary constantly and safeguard the stability of funds in the SEZ. To do so, we should augment the economic strength of the SEZ with regard to credit and increase the inherent appeal of the economy in the SEZ. This is an important financial task for the SEZ.

3. Various currencies are circulated simultaneously in the SEZ. During and before the initial period of the founding of the SEZ, Shenzhen used RMB for pricing and circulation of commodities. After the SEZ was completely open and along with the development of foreign economic relations and tourism, foreign exchange notes and Hong Kong dollars entered the market, resulting in the simultaneous circulation of three currencies. This situation has a definite, positive effect on invigorating the economy, promoting the open-door policy, and opening up the closed-door economy. However, when three currencies circulate simultaneously in Shenzhen, which is sandwiched between inland China and Hong Kong, the price of the same kind of commodity varies when traded in different currencies; therefore, the situation has also brought about some negative results such as illegal trading of foreign exchange and thereby reduced the value and credibility of RMB in this area. As a result, this situation has created arduous and complicated tasks and set forth higher demands on the financial departments of the SEZ. Efforts should be made to gain new understanding and sum up experience with regard to the scope of currency issue and withdrawal, channels and the pattern of circulation, etc.

4. The economy of the Shenzhen SEZ is in for a change of orientation. Shenzhen is undertaking a large scale of construction beginning with the development of commercial and real estate businesses. There is more infrastructure construction for the purpose of consumption than of production. The production increase rate is high but the economic results are poor. In 1984, the industrial output value increased 15 percent (as against the 14.2 percent of the national figure) but the profit rate of output value was only 9 percent (as against the 14 percent of the national figure). The product mix is uneven. There are very few hot-selling products. A large proportion of goods are sold on the domestic market. To support the change of orientation in the economy, financial work should also keep in step and undergo a series of changes. Banking work should reduce funds to help reduce the scale and speed of construction while helping raise efficiency, increase the production of hot-selling products and goods that can bring in foreign exchange, and facilitate the transfer of the economy to an export-oriented economy.

5. The financial work of the SEZ is faced with the developed financial market of Hong Kong. The fact that the trade and financial relations between Shenzhen and Hong Kong have increased and that free and quick access to information are available through the numerous Hong Kong-based institutions of the Chinese banking group has made it possible for Shenzhen's financial departments to

learn from Hong Kong's experience and knowledge of international finance. It has also made it easier for Shenzhen's financial departments to use Hong Kong's financial market, broaden their field of vision, and render better service for the development of the SEZ.

Things To Be Done by the Financial Departments of Shenzhen

There are many things waiting to be done by the financial departments of the Shenzhen SEZ. They should set long-term fighting goals and make short-term arrangements as well. They should tackle one job at a time in the order of urgency and importance and in accordance with existing conditions and the capacity of manpower. Things to be done in the near future are mainly as follows:

1. Study ways to solve the problem of fund shortage in the SEZ. At present, the SEZ is short of funds. To solve this problem, we should start with the following tasks: 1) Use existing funds where they are needed most, handle each case on its merits, and avoid "uniformity." Import and export projects on which contracts have already been signed should be treated differently. When making arrangements for circulating fund and fixed-asset loans, emphasis should be put on developing existing production capacity. Priority should be given to supporting the production of export products instead of products to be sold on the domestic market. Units with good economic results should be treated differently from those with poor economic results. 2) Activate inactive funds, locate existing inactive funds, and study measures to activate them on the basis of analyzing the composition and distribution of credit funds in the SEZ. 3) Banks should concentrate energies on circulating funds. The people's bank should double efforts to redistribute funds and serve specialized banks; strengthen the lending and borrowing relations between different banks and between banks here and banks in inland China; organize foreign funds for units which have the ability to pay back in foreign exchange and follow the procedures of examination and approval to raise funds for them; issue financial bonds to pool funds needed in the last stage of capital construction projects and circulating funds for putting projects into production and issue high-interest loans with high-interest deposits.

2. Solve the problem of credit funds distributed mainly piecemeal. Funds extended to the SEZ by various banks are controlled in a unified manner by the headquarters of the people's bank and allocated piecemeal to the Shenzhen branch offices of the people's bank. Because Shenzhen is a small area and has a very limited capacity for the redistribution of funds, the headquarters should give the Shenzhen branch a regulatory fund to be used as temporary working funds during the year. This is conducive to the unified arrangement and use of the SEZ's credit funds. It can also pave the road for the SEZ to establish an independent and balanced financial system.

3. Open a money market as soon as possible and organize funds through multifarious channels. It is necessary to break through the narrow view of depending only on deposits for pooling funds and open up a money market by practicing trust investment, issuing stocks and bonds, and opening up stock exchanges. After a money market is open, "negotiable prices" should be allowed for some capital. In other words, interest rates should be allowed to float

within a fairly large range. This can on the one hand satisfy urgent financial needs and on the other, screen enterprises through high interest rates so that efficient enterprises will be tested while inefficient enterprises will be eliminated by high interest rates.

4. Change the SEZ's financial system to an export-oriented one. In the long run, the SEZ should depend on its own strength for its economic development. The accumulation of funds is determined by the economic development of the SEZ. The key to the development of the SEZ is to change the economy of the SEZ from domestic-oriented to export-oriented. This can be achieved mainly by gradually striking a balance between foreign exchange income and expenditure with a little surplus, selling the majority of products on the foreign market instead of the domestic market and depending on superior products to make money abroad instead of depending on preferential conditions to make money in inland China. In order to meet the needs of the development of an export-oriented economy, the SEZ's financial system should also be gradually changed to an export-oriented one. At present, the main tasks are: import foreign capital and support the imports of advanced technology and equipment; render better service for foreign trade and exports; gradually enter the international capital and gold markets; and develop foreign-owned banks and joint-venture banks and initiate off-shore businesses.

5. Strengthen investigation and economic information work. The investigation should cover both financial and economic affairs, both domestic and foreign affairs, both isolated and current cases of daily work and long-term strategic goals. Efforts should be made to collect and transmit information through the investigation and bring into play the functions of information feedback.

6. Pay attention to the financial legislation of the SEZ and exercise economic control according to law. The financial departments of the SEZ should, in accordance with national financial laws, systems, rules and regulations and in light of the characteristics of the situation of the SEZ, formulate laws, systems and rules and regulations for the SEZ, strengthen financial control of the SEZ according to law and make it possible for state banks, non-bank financial institutions, foreign-owned banks, and joint-venture banks in the SEZ to operate within the limits prescribed by the financial laws of the SEZ.

SHENZHEN CREDITS TO INDUSTRY UP, COMMERCE DOWN

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 25 Oct 85 p 3

[Unattributed article: "Great Change in the Direction of Shenzhen's Foreign Exchange Credits This Year; Industrial Credits Rose From 7 Percent Last Year to 55 Percent; Commercial Credits Dropped From 83 Percent Last Year to 36 Percent"]

[Text] Shenzhen, 23 Oct (CNS)--There have been conspicuous changes in the direction of foreign exchange credits since the beginning of this year as granted by the Shenzhen Branch of the Bank of China. In the first 9 months, industrial credits rose sharply; they accounted for 55 percent, while they were only 7 percent for the entire period of last year. Commercial credits in comparison dropped from 83 percent during the entire last year to 36 percent during the first 9 months of this year.

Xu Guowei [6079 0948 1218], assistant manager of the Shenzhen Branch of the Bank of China, told reporters of this news agency at the cocktail party on the occasion of the establishment of the "Shenzhen Industrial Development Credit Fund" that the shift in the direction of these credits indicated an adjustment made in accordance with the actual conditions and the developments at Shenzhen. In the last few years, priority had been given to commerce, tourism and capital construction in order to improve the investment environment, to increase attractiveness to foreign capital and to lay the foundation for the development of industry, because several years ago Shenzhen's foundation was very poor and was not capable of developing any kind of industry. By now a good investment environment has basically taken shape in Shenzhen, there is a fast turnover of funds for whatever commercial and tourist enterprises that have been established and foreign exchange outlay for them can be recovered. During the first 9 months of this year, $110 million have already been recovered. Since the start of this year, Shenzhen has concentrated its efforts on developing foreign trade-oriented industries, which is the reason why the focus in credits shifted toward industry.

Xu Guowei added that it is due to these circumstances that the "Shenzhen Industrial Development Credit Fund" was established. The fund has already granted a credit of $2.4 million to the Nanhai Petroleum Shenzhen Central Service Corporation to assist in their development work.

Xu Guowei said that the support of the foreign exchange fund of the Shenzhen Branch of the Bank of China, as started at the beginning of this year, will give certain industrial enterprises the opportunity to develop, such as, for instance, the Zhongkong Glass Factory, a Chinese-foreign joint venture, which was granted a credit of $700,000 for the importation of technical equipment.

It is learned that the Shenzhen Branch of the Bank of China has provided state-operated enterprises, foreign-financed and joint venture enterprises a total of 760 million RMB and over $760 million to promote the development of Shenzhen industries.

SPECIAL ECONOMIC ZONES

SHENZHEN ECONOMIC FORUM RESULTS REPORTED

Beijing RENMIN RIBAO in Chinese 14 Nov 85 p 1

[By reporter He Yunhua [0149 0061 5478]: "The Country must support the Special Economic Zones; the Special Economic Zones must support the Country"]

[Text] A forum on the development of export-oriented industries in the Shenzhen Special Economic Zone [SEZ] recently sponsored by the State Council pointed out that the Shenzhen SEZ is a special economic zone of the whole country, the whole country should support the SEZ and the SEZ should serve the whole country.

At the forum, representatives of 18 departments and units of the central government conscientiously studied and discussed the question of how to develop export-oriented industries in the Shenzhen SEZ in the future. They thought that the establishment of the SEZ is an important part of the open-door policy. Managing the SEZ is not a task of one province nor one area where it is located. It should be a special economic zone of the whole country. All trades and professions in the country should treasure, show concern for and support the construction of the SEZ. Comrades working in the SEZ should also consider the situation as a whole, gain a foothold in the SEZ, keep in view the world, rely on inland China and wholeheartedly serve the whole country.

Participants at the forum thought that it was not easy for the Shenzhen SEZ to push more than 200 products into foreign markets and for the direct export sales of industrial products to account for 33.4 percent of the total value of industrial output within a period of only 6 years. The development of the Shenzhen SEZ is one of the achievements scored as a result of the implementation of the open-door policy since the 3d Plenum of the 11th CPC Central Committee that has attracted world-wide attention. At the same time, they also thought that there is still a great gap between the existing production capacity and level of the Shenzhen SEZ and the goal of building a export-oriented multi-purpose special economic zone. Further efforts need to be made to bring into play the advantages of the Shenzhen SEZ.

SHENZHEN'S DEVELOPMENT OF EXPORT-ORIENTED ECONOMY

Shenzhen SHENZHEN TEQU BAO in Chinese 30 Sep 85 p 4

[Article by Li Ganming [2621 1631 2494]: "Zhou Weiping[0719 4850 1627], Deputy Director of the Hong Kong and Macao Economic Research Center, On Some Issues Regarding Shenzhen Special Economic Zone Developing an Export Oriented Economy."]

[Text] In early September in Guangzhou,this reporter interviewed Zhou Weiping, deputy director of the Hong Kong and Macao Economic Research Center and the assistant editor of the `Hong Kong and Macao Economy' magazine, on issues regarding Shenzhen Special Economic Zone developing an export oriented economy. The following is Zhou Weiping's discussion in part:

1. For the zone to develop an export oriented economy, it must first realize and utilize two big advantages--its high degree of openness to the outside and its close proximity Hong Kong.

Zhou Weiping believes that Hong Kong's advantage is its internationality; it is one of the most open areas in the world, a center for international trade and banking. Shenzhen, moreover, when compared to other domestic regions, has two main advantages: 1) it is the most widely open to the outside, has the largest area, and is the earliest comprehensive special economic zone to open up to the outside; and 2) it is closely linked with Hong Kong both historically and geographically. Other domestic special economic zones and coastal open cities do not have such advantages and these advantages will have long lasting effects. As the zone develops an export oriented economy, it should recognize and fully utilize these two unique advantages by actively fostering cooperation with Hong Kong, meeting each other's needs and helping each other forward. At the same time, Shenzhen is also in a pivotal position for domestic liaison between Hong Kong and countries abroad. Only by keenly recognizing and utilizing the two advantages above can the zone give full play to these four "door opening" roles.

2. Fully understanding the concept of open, two way and export oriented economies and the relationship of the three is very useful when putting them into practice.

Zhou Weiping said, special economic zones are a product of the policy of opening to the outside world, hence they must develop economies that are open. These economies are the direct opposite of closed economies; they are developed commodity economies,not self developed natural economies.Both open and developed commodity economies inevitably deal in domestic and foreign markets, and are open both internally and externally; in this way, they are also two way economies. At the same time,viewed from internal or external proportions,two way economies can also be divided into mainly export oriented or mainly domestically oriented types.Because Shenzhen possesses the two advantages already mentioned, it should, when viewed objectively and from the standpoint of central government demands, develop an export oriented economy. Here it must be emphasized that export oriented means only mainly export oriented,as distinguished from a mainly domestically oriented economy, and therefore does not imply isolation from the country's interior. Seen in this light, export oriented, two way and open economies are neither contradictory nor opposing; the three are inherently intertwined.Complete comprehension of this concept helps when attention is paid to the practice of playing up the zone's pivotal role in expanding domestic and foreign trade to expedite the modern construction of the country.At the same time, this will enable people to better understand that there is a process involved in its domestic-to-export transformation, and that its proportion of exports is gradually increasing. This transformation process demands vast amounts of work.

Zhou Weiping said further that there are two views on this issue worth noting: 1) "using such vague terminology as two way and open to simplify matters is not suitable" for the Shenzhen Special Economic Zone. The intention of this wording is clear enough; that is, the zone's economy can only be transformed from being domestically oriented to being export oriented. Basically,I agree with this view, because stressing the latter avoids misconceptions about the direction of Shenzhen's development which stem from people's poor undertanding of what open and two way economies are; and 2) "advocating a model `export oriented' special economic zone is a policy which in reality isolates inland markets. There is decidedly nothing progressive about this; it does not conform with objective requirements for developing a commodity economy." To me, this can only be termed a misunderstanding, because such a transformation does not imply policy of isolating inland markets.

3. Two additional views on tactical objectives for development of the Shenzhen Special Economic Zone

Zhou Weiping said that Liu Guoguang [0491 0948 0342], in his article in the August 9, 1985 issue of People's Daily, summarized the tactical goals of the zone thus: "to establish Shenzhen as a comprehensive, export oriented special economic zone, emphasizing advanced industry, simultaneous development of industry and trade, and integration of industry, trade and technology, with finance, tourism, services, real estate and farming, animal husbandry and fishing as sideline businesses;and change it into a new type of city with a rational structuring of production enterprises and advanced scientific technology where people are prosperous and where spiritual and material progress is highly advanced to make ever greater contributions to the socialist construction of the interior and the whole nation." I agree fundamentally with the way this is put, but I still want to add two points: 1) I want to especially mention the issue of earning foreign exchange. While no doubt the goal of advanced industry in the zone the zone is to earn foreign exchange by exporting, trades and businesses must also shoulder this responsibility. In describing tactical goals, therefore, the wording "the goal of exporting to earn foreign exchange" should probably be added to make the aim of becoming export oriented clearer and more precise; 2) the wording "...agriculture, animal husbandry and fishing as sideline businesses" can be improved to read "suitably develop highly scientific and modernized planting and breeding operations." Baoan County is part of the Shenzhen Special Economic Zone and has already been singled out as a base for developing planting and breeding operations, but Baoan County is not within the zone's boundaries. According to plans, only 100 square kilometers of land in the 327.5 square kilometer zone area can be developed. The rest is mostly hills and slopes, unfit for use by industry. Using this land for suitable development of highly scientific and modernized planting and breeding operations would increase foreign exchange income for the zone and spur development of an export oriented economy. But it should be noted that the zone should mainly foster the development of advanced industrial exports to earn foreign exchange; undertaking some highly scientific and modernized planting and breeding operations would not be contradictory to this development.

SPECIAL ECONOMIC ZONES

CONTROL OF FOREIGN CAPITAL IN XIAMEN DISCUSSED

Fuzhou FUJIAN LUNTAN [FUJIAN FORUM] in Chinese No 11, 5 Nov 85 pp 25-27

[Article by Guo Chaomu [6753 2600 2606]: "Preliminary Discussion of the Control of Special Economic Zones Over the Use of Foreign Capital and the Importation of Technology"--Study of Foreign Economic Relations]

[Text] In the development of the construction of special economic zones, how to do a good job in the control over the use of foreign capital and the importation of technology is an important question concerning the success and failure of undertakings in special economic zones. This article will discuss some views on the question of control over the use of foreign capital and the importation of technology in the Xiamen Special Economic Zone.

Since its establishment in 1980, especially since its scope was extended to the entire island, the Xiamen SEZ has greatly speeded up the use of foreign capital and the importation of technology and made great achievements in this regard. According to statistics, by the end of 1984, it had signed a total of 152 agreements on the direct use of foreign capital involving a total investment of $696,362,600, of which, $382,543,600 is foreign capital. In 1984 alone, it signed 128 contracts on the direct use of foreign capital involving a total investment of $509,710,500, of which, $274,809,000 is foreign capital, accounting respectively for 84.2, 73.2 and 71.8 percent of the sum total during the 1980-84 period. Of all contracted projects, 35 have already been put into production. At the same time, 67 enterprises in Xiamen City have signed 103 contracts for the importation of technical equipment involving a projected total investment of 977 million yuan. The contracted deals are worth $230 million. Sixty-four pieces of technical equipment have arrived (of which, 44 have been put into production). After all the equipment is put into production, the Xiamen SEZ's output value will increase 978 million yuan and tax and profit delivery, 380 million yuan. In the course of using foreign capital and importing technology, the Xiamen SEZ has gained some experience in the control of the use of foreign capital and technology import and learned some control skills. However, many problems still exist. For instance, the starting point is low and scale is not big enough in imports; too much foreign exchange is spent but little is earned; much hardware but little software is imported; more products are sold to the domestic market than to the international market; and there are many labor-intensive projects than to the international market; and there are many labor-intensive projects but few technology- and knowledge-intensive projects. All these have made it impossible to meet the new demand of the economic development of the SEZ.

To accelerate the use of foreign capital and the importation of technology, increase social and economic results and give full play to its role as a window, the Xiamen SEZ still needs to do a good job in the following areas concerning the control of imports:

1. Further clarify guiding ideology and keep to the correct orientation in imports. The purpose of establishing SEZ in China is to use them as windows to accelerate China's four modernizations. The use of foreign capital and the importation of technology should be undertaken in close connection to the effort to give full play to the role of the SEZ as a "window." Compared with the other three SEZ's, the Xiamen SEZ has a superior location and natural environment for it is located in the center of China's "gold coast" and the hub of sea transportation. The Xiamen Island has many old enterprises, a relatively solid foundation of industry, considerable scientific and technological strength and ability to assimilate science and technology. The permission of the central government for the Xiamen SEZ to implement certain policies, free port in particular, has put the Xiamen SEZ in a more superior position. Therefore, it is necessary and possible for the Xiamen SEZ to have a higher starting point than that of other SEZ in the use of foreign capital and importing technology. Only by doing so can it give better play to its advantages and become a better "vanguard." Because of this, it should pay attention to the following issues in regard to guiding ideology and keeping its import orientation: 1) Import advanced technology in a concentrated effort to develop industry, import other projects accordingly, form a rational structural lineup and gradually develop Xiamen into a comprehensive SEZ: 2) emphasize quality instead of quantity in imports, judge and select projects on the basis of whether they are conducive to developing new technologies and fledgeling industries, transforming existing enterprises and opening international markets and bringing about three changes--from equipment trade to technology transfer, from labor-intensive to technology- and knowledge-intensive and from domestic-oriented to foreign-oriented; 3) keep to the overall and long-term point of view and correctly handle the relations between the immediate and long-term benefits of imports and between local and national interests; 4) make full use of the original industrial basis, link technology import closely to the transformation of old enterprises, upgrade old enterprises, try to avoid starting new ones and reduce capital construction investment; 5) import advanced scientific management techniques and methods while importing advanced technology; and 6) organize people to assimilate and absorb imported advanced technology and management methods, carry out innovation, transfer them as soon as possible to inland China and give full play to social and economic results.

2. Strengthen overall planning. Conducting overall planning of the use of foreign capital and importation of technology is an important question concerning to which direction the construction of the SEZ will develop and whether or not the purpose of establishing SEZ can be achieved. But in the past few years, the Xiamen SEZ has failed to do a satisfactory job in this regard and lacked overall planning. There are ideological as well as

practical problems involved here. Some comrades lack sufficient understanding of the significance of conducting overall planning of the use of foreign capital and importation of technology. They overemphasize the fact that the Xiamen SEZ is a SEZ that implements certain free port policies and a management system guided by planning and based mainly on market regulation. They even mistakenly believe that it is very hard to make plans ahead of time because foreign capital and advanced technologies are in other people's hands and we cannot control what others will give us. Instead of getting hold of all information, on the basis of clarifying the strategic ideas of the SEZ, make a development plan and then decide what to import, they often reverse the procedure--determine what to import first and then write feasibility reports. Sometimes, they even go ahead and import whatever foreign businessmen are interested in. Some projects are "special-favor projects" added by higher-ups. All this has made it difficult to avoid being taken or cheated and caused unnecessary losses to the state and serious impacts on the development of the SEZ. Therefore,d
caused unnecessary losses to the state and serious impacts on the development of the SEZ. Therefore,n capital and
importation of technology and strengthen overall planning. At the same time, it is also necessary to educate cadres at all levels, especially those directly engaged in foreign economic activities, demanding that they do everything strictly according to planned procedures. Those who violate the plan and do things in their own way should be criticized and educated. Those who cause serious losses will be held responsible for their conduct.

To strengthen the overall planning of the use of foreign capital and importation of technology, first of all, we should do a good job in the import plan of the SEZ as well as that of industries and enterpriese and establish an organic link between these plans, in accordance with the demand of the overall development plan of the Xiamen SEZ. At the same time, we should link these plans to the long- and short-term development plans of the national economy as a whole and strive to coordinate them with the overall development strategy of the national economy. Secondly, we should make full use of various forms of importation, make rational arrangements for the flow of foreign capital and the lineup of imported projects and technology and enable the Xiamen SEZ to have its own characteristics and emphasis. At the same time, we should carry out necessary readjustments in a timely manner concerning the contents of our plans according to the political and economic changes and the scientific and technological development of the world.

3. Measure the overall social and economic results of imported projects. Social and economic results on the use of foreign capital and importation of technology have a direct bearing on the future of the SEZ; therefore, in the course of using foreign capital and importing technology, the SEZ should measure both micro- and macro-results, both single-item and comprehensive results, both immediate and long-term results and both economic and social results. Although the Xiamen SEZ has made great achievements in import work in the past few years, some projects have failed to yield satisfactory results. For instance, according to statistics, between 1979 and 1984 the Xiamen SEZ spent $41.51 million and earned $4.5 million, averaging $10.80 per every $100 of investment. Even joint ventures and cooperative enterprises did not earn very much foreign exchange. Despite the fact that there were already three television set factories in the province, a company went ahead and imported a

television set assembly and production line which helped earn an additional 16.58 million yuan of income for the state in the year after it was put into production. However, since it only assembles modules and components and all products are sold on the domestic market, the market we gave up did not bring in and get hold of major technology. Originally we thought we could use it to bring along the technological transformation of Xiamen's electronics industry. As of today, this purpose has yet been achieved. Moreover, in 1984 letters of credit alone cost $2.67 million. Judged from the situation as a whole, the results of this import project ought to be considered as poor.

To measure the overall social and economic results of import projects, we need to design a series of goals, form a goal system and reflect the technical, economic, social and ecological value of an import project in a comprehensive manner. For instance, to reflect technical value we need such targets as technical composition rate including the rates of machinery equipment, power resources, electricity, labor funds and various other equipment, various technical parameters of automation and mechanization and the development and use rates of new energy resources and new raw and semi-finished materials. To reflect economic value we need such targets as the conservation rates of labor, raw and semi-finished materials, energy resources and funds, investment result coefficients, the profit delivery and tax rates of investment, the recovery rates of investment, cost profit rates, labor productivity, ratios between the labor and production levels of Chinese and foreign enterprises and the output, quality and foreign exchange earning rates of products. To reflect social and ecological value we need various comprehensive targets concerning labor conditions and other targets such as the conservation of total social labor, the effectiveness of environmental protection and the degree of pollution elimination. The target system for measuring the social and economic results of import projects is still being explored and studied. We should make further efforts so that we can measure their quantitative and qualitative value and achieve the best social and economic results, but we should not let this affect the current import work. To increase the social and economic results of current import projects, we should pay attention to the following links: 1) Organize imports strictly according to the plan. We should strive to organize people to carry out all projects in the plan and try to reject all projects that are not included in the plan to avoid losing control over the scale and undermining overall balance. 2) Strengthen feasibility study. According to the demand of the plan, we should conduct overall analysis and discussion of imported projects in regard to technical, engineering, economic and social respects, make scientific appraisal and provide a basis for policy decisions on imports, engineering designs, bank loans, talks and contracts to avoid mistakes in imports. 3) Adopt the pluralistic method of importing. We should implement the principle of diversifying the source of funds in using foreign capital, avoid importing only from a certain country or area and avoid relying on foreign countries. In importing technology, instead of limiting ourselves to a certain company, we need make more comparisons to give us more choices, have the initiative in our hands and reduce blindness. 4) Insist that experts participate in foreign inspection tours, talks and signing contracts and avoid such practices as passing incompetent people off as experts just to make up the number. 5) Implement the principle of mutual benefits. Those investors who use illegal means to infringe on the interest of our side and those people on our side who let personal relations get in their way and show generosity at the expense of the state should be punished by law and placed under serious investigation. 6) Do a good job in the import responsibility system and acceptance work.

4. Establish an information network and strengthen information work.

Judged from the current situation, the information work of the Xiamen SEZ is still very weak and cannot meet the needs of import work. Along with the economic construction and development of the SEZ and the increasing scale of the use of foreign capital and technology import, the quantitative demand of relevant information data will increase continuously. How to obtain, in a timely and accurate manner, useful economic information from numerous complex flows of information has already become the key to the success and failure of the SEZ in the use of foreign capital and importation of technology. Therefore, we must make great efforts to strengthen the information work of the SEZ. First, we should establish as soon as possible an information network. Initiated by a certain unit or center of Xiamen City, this network should absorb more units which have access to more information. In addition, it should be equipped with computers and modern communications technology and equipment to form a network with large cities in the inland areas, Hong Kong and foreign countries. Second, we should step up the efforts to bring in from abroad and train a group of information experts and provide them with sufficient conditions so that they can concentrate on their work. Third, we should begin collecting fees for information service to arouse the enthusiasm of all fields.

5. Further improve import control organs, tighten the control system and strengthen administrative leadership and professional supervision. In order to meet the needs of the use of foreign capital and importation of technology the Xiamen SEZ has done much work in this regard. But as the scope of direct import and export units expands and import projects continue to increase, import control organs and control system need to be further improved and tightened to strengthen administrative leadership and professional supervision and ensure a smooth progress for import work. In view of this, some comrades suggest that an import coordinating organ be set up under the leadership of the city government. This organ should be staffed with a definite number of full-time administrative and managerial personnel and then according to needs hire temporary specialists and invite concerned societies to participate mainly in the feasibility studies of import projects and the research of the assimilation and innovation of new technologies in addition to solving major technological problems. This is a noteworthy suggestion. Other import control organs should also be further improved and consolidated according to the needs of the development of the situation to seek highly efficient and simple administration. At present, the control system needs to be further improved in the following few areas: 1) Mete out new procedures for using and earning foreign exchange and ensure that all fields are considered while key points are guaranteed in using foreign exchange so that the money is used where it is needed most; encourage enterprises to earn foreign exchange and ensure that plans are fulfilled as scheduled. 2) Perfect the import responsibility system to ensure that somebody is in charge of every link of every import project to avoid dislocation in the process or disputes over trifles. The current import control system should be conscientiously summed up and further improved to

give better play to its functions. 3) Tighten examination, approval and acceptance systems. Those projects submitted for approval should be turned down if they have not undergone feasibility study or followed import procedures; no imported technical equipment will be allowed to go through relevant procedures if it is proved unacceptable. 4) Draw up a set of measures for carrying out domestic coordination and ensure that opening to the inland areas make effective use of funds and personnel.

6. Speed up the import and training of managerial personnel. In the past few years, the Xiamen SEZ, through the efforts of all fields, has imported and trained a large number of talented people. In spite of this, there is still a great demand for talented people, especially mangerial personnel. To ensure smooth progress in its imports, the Xiamen SEZ must, on the basis of investigation and study, formulate as soon as possible an appropriate personnel import and training program to quickly build a contingent of managerial personnel who are good at the use of foreign capital and technology import.

SPECIAL ECONOMIC ZONES

TAX POLICIES SUITABLE FOR XIAMEN DISCUSSED

Fuzhou FUJIAN LUNTAN [FUJIAN FORUM] in Chinese No 11, 5 Nov 85 pp 22-24, 5

[Article by Ge Nanxiang [5514 0589 5046] and Chen Bingrui [7115 3521 3843]: "A Probe Into Improvement of the Tax System in the Xiamen Special Economic Zone"]

[Text] To give full play to the role of special economic zones as windows they first must absorb foreign capital. To absorb foreign capital, creating a good investment environment that is attractive to foreign businessmen is a must and taxation is, of course, an indispensable link. In 1984, the CPC Central Committee and the State Council decided to expand the Xiamen Special Economic Zone to the entire island and, at the same time, announced that Xiamen may implement some free-port policies. Because of this, how to improve the tax system of the Xiamen SEZ to meet the need of the new situation is a problem requiring immediate study and solution. This article attempts to make a preliminary probe into the tax model of the Xiamen SEZ from an overall point of view.

I. Generally speaking, in overseas investment of foreign capital, at least four factors are considered: 1) The safety of investment; 2) the profitability of investment; 3) the consistency between investment and company's development; and 4) the feasibility of investment. Among them the most important is safety. Since China's social system is completely different from that of Western countries, the stability of policies and the formulation and perfection of various laws are of great significance especially to attracting foreign capital. The market should be properly opened to foreign investors to let them gain some profits. As long as these two problems are well solved, taxes will become an important counter for effectively absorbing and using foreign capital. Currently, some people think that the key to attracting foreign capital is a comprehensive and complete environment for investment, not preferential tax treatment. Some even think that offering preferential tax treatment alone and giving little consideration to other more important matters is like putting the cart before the horse. This view that excludes preferential tax treatment from investment environment and ignores the function of taxation is erroneous. Of course, the one-sided pursuit of "fewer tax categories, lower tax rates, more preferential treatment and fewer procedures" is also not conducive to developing the function of the tax lever.

What kind of tax model is appropriate for the Xiamen SEZ according to its concrete conditions? We believe that in general the Xiamen SEZ should adopt a low tax structure based on direct taxes (mainly income tax) and supplemented by indirect taxes. The concrete plans are as follows:

1. As a major tax category of the Xiamen SEZ, enterprise income tax should reflect the following two demands:

First, it should reflect the demand for differential treatment for different industries and same treatment for all departments under the same industry. According to the report approved by the State Council, Xiamen should be built into a comprehensive, export-oriented special economic zone which will focus on industry while developing tourism, commerce, and real estate businesses. This orientation is completely correct. However, in the development of many industries and sectors, we must distinguish what is primary and secondary, what is priority and what is urgent. We should not rush headlong into it, trying to do everything all at the same time. We hold that in regard to industrial structure, importing industrial technology should be the key and importing other things, the supplement; in regard to the import of industrial technology, relatively advanced industrial technology should be the key and general consumer goods production technology, the supplement; and in regard to the import of advanced industrial technology, software or crucial parts and components should be the key and hardware or complete set of equipment, the supplement. Judged from the import situation of the past few years, a prevailing phenomenon is that it is easier to carry out talks on commercial, tourism and service projects and more contracts have been signed and fulfilled for such projects, but, except for everyday consumer goods such as household electrical appliances, cigarettes and liquors, very few talks on industrial technology have been successful, not to mention really advanced industrial technology. This problem prevails not only in the Xiamen SEZ, but also in other SEZ's and 14 coastal open cities. If this situation remains unchanged, the open policies will not be able to fulfill projected goals. Therefore, fixing different tax rates for different industries according to different situations to demonstrate differential treatment is totally necessary. Some comrades disagree. They think that taxing different industries according to the same tax rate can encourage competition and at the same time make it easier for tax departments to control and collect taxes. It is very hard for us to agree with this view. Different industries are different in the nature, scope and targets of production and operations, the demand for the input of labor, financial and material resources, the amount of risks involved and the degree of difficulty in the sources of their income. The only way to treat them rationally is to treat them differently. Practice of uniformity is not good for encouraging the import of advanced industrial technology. As for easier control and collection, we should strive to make things easier for tax control and collection only if we are able to give full play to the function of the tax lever, which is a prerequisite not the other way around. In the same industry, enterprises of different nature, whether they are run by the state or collectives and whether they are joint ventures or wholly owned, must be treated equally.

Second, it should reflect the demand for different treatment between the Xiamen SEZ and other special economic zones and 14 coastal open cities. In

November 1984, the State Council promulgated the "Provisional Regulations for the Reduction and Exemption of Enterprise Income Tax and Industrial and Commercial Consolidated Tax in Special Economic Zones and 14 Coastal Port Cities" (abbreviated as the "regulation" hereafter). Since then, joint ventures and wholly-owned foreign enterprises in special economic zones and 14 coastal open cities have been levied generally the same amount of enterprise income taxes. This measure of uniformity has caused special economic zones to lose their tax advantage and adversely affected the efforts of special economic zones, especially the Xiamen SEZ, to attract relatively advanced industrial technology. In our opinion, the enterprise income tax rate of the Xiamen SEZ should be lower not only than that of open economic areas but also than that of the other three special economic zones. Compared with these areas, Xiamen should be more lenient in granting reductions in, and exemption from, income taxes and it should have more decision-making power in regard to taxation. In addition, in light of different situations, the Xiamen SEZ may consult foreign experience and adopt an accelerated depreciation method for Sino-foreign joint ventures and wholly-owned enterprises.

2. The personal income tax fails to reflect the preferential treatment of special economic zones because the "Personal Income Tax Law of the People's Republic of China" currently in effect is formulated according to the general situation of the country. Additional rules need to be drawn up according to the situation. For instance, the personal income tax rate of special economic zones should be properly reduced. The highest bracket of current tax rate is 45 percent, much higher than the 25 percent of Hong Kong. For another instance, in order to encourage foreigners to become residents of special economic zones, their tax exemption period may be extended from the current 90 days to a year and so on.

3. In order to build Xiamen into an international financial center, Xiamen should be granted local jurisdiction. In other words, Xiamen may stipulate that foreign companies, enterprises or individuals will be exempted from income tax on the income they earned elsewhere (other parts of China and foreign countries) and remitted to Xiamen Island; no income tax will be levied on interest drawn from the foreign currency deposits of financial institutions on Xiamen Island; and income tax levied on interest drawn from the RMB deposits will be reduced to a half. This stipulation can help Xiamen play the role of a duty-free port and attract large amounts of foreign capital and funds from other parts of China.

4. Joint ventures and wholly-owned foreign enterprises in special economic zones should pay a higher rate of income tax on the sales of goods to the inland, according to a prescribed ratio, than that on exports or sales in special economic zones. There are different situations:

A. Joint ventures and wholly-owned foreign enterprises pay 30 percent of income tax on the sales of goods to the inland according to stipulations.

B. Foreign businessmen pay 35 percent of income tax on the income earned from selling directly imported products to the inland according to the provisions of agreements.

C. If foreign businessmen have really provided relatively advanced technology, as an exchange condition, income tax levied on the income they earned from selling to the inland part of the products they produced in special economic zones or they directly imported from abroad will be reduced to 15 percent.

The above measures are suitable not only for the Xiamen SEZ but also for other special economic zones and economic open areas. Their purpose is to restrict the domestic sales of foreign products and protect the domestic market. Some comrades may think this would dampen foreign businessmen's enthusiasm for investment, but it is not so. When foreign businessmen come to invest in China, they are mainly interested in the China market, therefore, offering them double benefits--the market and preferential tax rates--is unnecessary. Besides, even the 30-35 percent tax rate is not only much lower than the 55 percent tax rate of state-run enterprises but also lower than the income tax rates of developed capitalist countries such as the United States and Japan.

5. After the control system of special economic zones is established, the Xiamen SEZ still should levy indirect taxes such as a product tax, business tax and value-added tax. However, they should be flexible according to the situation.

6. The Xiamen SEZ should still levy import and export customs duties but they should be limited to the import of liquors, cigarettes, various mineral oils and high-class cosmestics and products whose exports are restricted by the state. Other products should be allowed to be imported and exported freely. All transit commodities are exempted from customs duties. Industrial enterprises in special economic zones should pay additional import taxes on products which are made of imported materials or parts if such products are sold on the domestic market.

7. In addition to the above tax categories, it is also necessary to levy land use taxes, entertainment taxes, stamp taxes, inheritance taxes, property taxes and urban maintenance and construction taxes, but tax rates should not be too high.

II. Judged by the above assumption of the tax system of the Xiamen SEZ, we think that the current tax system mainly has the following defects:

1. The Xiamen SEZ fails to distinguish itself in the tax system. As mentioned before, according to the provisions of the "regulations," the tax burden on special economic zones is basically the same as that on economic open areas and there is no disparity between them. This is not right. At a forum sponsored by the State Council in January 1985, leading comrades of the State Council clearly pointed out: At present, China's opening to the world has formed a three-tier structure with four special economic zones as the first tier, coastal economic open areas as the second tier and the Changjiang, Zhujiang and southern Fujian delta areas as the third tier. If so, the tax system should also reflect the different characteristics of the three tiers. Since the Xiamen SEZ is entrusted with two major missions--open to the outside world and promote the return of Taiwan to fulfill the great cause of the

reunification of the motherland--its tax system especially needs to be distinguished not only from those of economic open areas but also from those of other special economic zones. In our opinion, the Xiamen SEZ should have its own relatively independent tax law to genuinely reflect certain policies of a free port.

2. The tax burden on joint ventures and wholly-owned foreign enterprises is inconsistent with that on domestic enterprises. This is demonstrated in two aspects:

A. According to current stipulations, joint ventures and wholly-owned foreign enterprises pay enterprise income tax at a 15 percent rate whereas large and medium-sized state-run enterprises pay a 55 percent rate plus regulatory tax on after-tax profits and small state-run enterprises and collective enterprises pay taxes according to the above-quota progressive tax system. This uneven distribution of happiness and hardship has dampened the enthusiasm of domestic enterprises. Many domestic enterprises go for joint ventures blindly in order to enjoy the benefits in taxation. This is indeed a noteworthy problem. In our opinion, enterprises of different natures under the same industry in the Xiamen SEZ should pay taxes according to the same tax rate.

B. In regard to indirect taxes, joint ventures and wholly-owned foreign enterprises are exempted from industrial and commercial consolidated taxes on export products whereas domestic enterprises still have to pay product taxes and value-added taxes. This is irrational. As for products sold on the domestic market, joint ventures and wholly-owned foreign enterprises should pay industrial and commercial consolidated taxes according to stipulations. The departments concerned of the central government recently stipulated that industrial and commercial consolidated taxes may be fixed according to the lower rates of industrial and commercial taxes. This is irrational in two aspects: First, foreign-funded enterprises and domestic enterprises belong to different tax categories which have caused not only the disparity of their tax burden but also unnecessary trouble for tax control and collection work. Second, after the second-step of the tax-for-profit reform is carried out in an all-round way, original industrial and commercial taxes will no longer exist; therefore, industrial and commercial consolidated taxes should not be fixed according to industrial and commercial taxes. We think that because product tax and the like are part of the product price, allowing foreign-funded enterprises to pay a lower tax than domestic enterprises is unfavorable for protecting the domestic market. Therefore, it is necessary to legalize as soon as possible the product tax, value-added tax and business tax to replace industrial and commercial consolidated taxes currently levied on foreign-funded enterprises so that foreign-funded enterprises and domestic enterprises can pay taxes under the same tax category and according to the same tax rate.

3. What do we do with the income of the Chinese investor of a joint venture? The present method is: If the Chinese investor has a parent unit, his income will be figured into the income tax of his parent unit; if he does not have a parent unit, his income will be considered as extra-budgetary income and he will pay a 60 percent tax to financial departments. Now many enterprises want to fit into the category of extra-budgetary income tax because it is

worthwhile. In our opinion, neither of the above methods is recommendable. A better method is to levy a regulatory tax on the profits of the Chinese investor according to the system used in domestic enterprises, but profits used for reinvestment may be exempted from taxes.

4. Currently, the tax burden on foreign-funded enterprises is the same as that on enterprises funded by overseas Chinese. This situation should be changed. More preferential treatment should be given to enterprises funded by overseas Chinese. If it is hard to change tax rates, at least there should be differences in the amount and time period of tax exemption and reduction.

5. The development of coordinated domestic enterprises has given rise to the problem of financial distribution between special economic zones and other parts of China. At present, no appropriate stipulations have yet been meted out for this problem. A method that is easy to be accepted by the public is: Enterprises from the inland areas will be exempted from Xiamen's regulatory tax on the profits they earned from engaging in coordinated domestic enterprises, enterprises jointly funded by them and foreign businessmen or enterprises jointly funded by them, special economic zones and foreign businessmen.

6. How to solve the contradiction between preferential treatment in taxation and temporary reduction in revenue is a fairly prominent problem especially in Xiamen. At present, Xiamen's budget is already very tight. If preferential tax treatment is offered on a wide scale, Xiamen's revenue is bound to decline within a short period of time. This is indeed a problem. In our opinion, preferential tax policies must be implemented; otherwise, it will stunt the growth of the Xiamen SEZ. In order to solve the problem of revenue reduction, we suggest that the central government let Xiamen implement an independent financial system and that the part of revenue delivered by Xiamen to the provincial treasury be appropriated to Fujian province by the central government as fixed-quota subsidies.

SHANTOU'S DEVELOPING EXPORT-ORIENTED ECONOMY

Shenzhen SHENZHEN TEQU BAO in Chinese 29 Sep 85 p 2

[Text] In its development over the past three years, the Shantou Special Economic Zone has been following the guiding principle of "making foreign sources the main source of capital, making industry and agriculture the basis of the production structure, and making exports the main goal of production." The zone has taken further steps to import from abroad and link up with relevant units in the interior and has been steadily developing an export-oriented economy.

So far this year, the SEZ has realized a substantial increase in each of the various economic indicators as compared to last year. Investment in capital construction from January to July increased 4.74 times over that of the same period last year, to 37,710,000 yuan. Contracts were signed for 88 projects involving foreign imports and coordination with interior units, 69 more this year as compared to the same period last year. Total investment for signed and registered projects amounted to 2.19 times more than for the same period last year and 1.6 times greater than the combined total of the previous two years.

As of the end of July, the Shantou Special Economic Zone had handled the registrations of a cumulative total of 197 industrial and commercial enterprises involving a total investment of 1.8 billion Hong Kong dollars. Fifty-eight of these enterprises were foreign-owned enterprises with an investment of nearly 600 million Hong Kong dollars, 93 were enterprises involving foreign imports and coordination with domestic departments with investment totaling nearly 800 million Hong Kong dollars, and 46 were enterprises established by the zone itself and directly subordinate to it with investment amounting to nearly 400 million Hong Kong dollars. Investments absorbing foreign capital and coordinated with domestic units amounted to 1.4 billion Hong Kong dollars, or 72 percent of the total.

Production is structured mainly around industry and agriculture. Of the 197 enterprises now registered, 122 are industrial and 28 are agricultural and together they make up 76 percent of the total. This conforms to the aim of developing the zone into a base for processing industries, the production of aquatic products, and fruits and vegetables.

Industrial products of the zone include plastic manufactured products, clothing, electric toys, rugs, furniture, replica porcelain pieces and handcrafted jewelry, 80 percent of which have entered the international market. Agricultural products include eel fry, mature eel, items manufactured from snakes, wild animals, and fruits and vegetables, 96 percent of which is exported. According to incomplete statistics, agricultural companies in the zone have earned more than 30 million Hong Kong dollars in foreign exchange.

LABOR AND WAGES

VALUE OF WAGE REFORM IN ENTERPRISES ASSESSED

Beijing JINGJIXUE ZHOUBAO in Chinese 15 Dec 85 p 7

[Article by Qian Shiming [6929 0013 2494]: "Discussion of the Pros and Cons of the Enterprise Wage Reform"]

[Text] Several years of experimenting on the reform of the enterprise wage (including bonus) system have drawn many comments, both positive and negative. Where shall the enterprise wage reform go from here? Where is the crux of the problem? These questions need to be studied and explored conscientiously.

1. The basic model of reform must be distinguished from the concrete model.

The so-called basic model of the enterprise wage reform refers to the general orientation and principles of the enterprise wage reform which can be summarized into two phrases: Change distribution from one-level to two-level and policy making from centralized to decentralized. To be specific, the enterprises' wage bill should be linked to their economic results and allowed to float in tandem.

The so-called concrete model of the enterprise wage reform refers to the whole set of concrete measures, systems, and methods adopted, under the prerequisite of achieving the basic model, to establish the link between the wage bill and economic results.

2. The basic model of the enterprise wage reform is correct and must be adhered to firmly.

Linking enterprises' wages to economic results and having them float in tandem is determined by the objective condition of a planned commodity economy. It is not a product of the people's subjective will. If they are not linked now, objective necessity will force them to be linked in the future. Experience gained in the past few years of practice also proves this effective. Although it is imperfect and still has problems of one kind or another, the results as a whole are good. In addition, linking wages to economic results is also a precondition for the reform of urban economy. The essence of the reform of the urban economic system is to change the product economy to a planned commodity economy and change enterprises from subsidiaries of state organs to independent commodity producers and dealers. In order to give enterprises impetus , they should be allowed to seek their own interests. The practice of "establishing the link" is just the mechanism that creates such impetus for enterprises. Without it, the reform will encounter unimaginable difficulties in all aspects.

3. The formation of a whole set of scientific and rational concrete models for the wage reform requires a prolonged exploring process.

Concrete forms, methods, systems, and measures for linking the enterprises' wage bill to economic results cannot be made perfect all at once. At present, due to the absence of external conditions and a lack of experience, the concrete models we selected must have contradictions of one kind or another. They may cause mistakes or even dangers which are unavoidable. For instance, often discussed problems are uneven distribution of happiness and hardship, rivalry, lashing "the fast ox," "putting profits before everything" and loss of macro-control. Actually, some of these problems are irrelevant to "establishing the link." Take the loss of macro-control of consumption funds for example. First, in 1984 very few enterprises, at most 20 percent, carried out the experiment on "establishing the link." Second, among the different incomes of enterprises' workers, wages and bonuses increased almost in tandem with the national income after deducting the price factor. Besides, it is also easier to control this part. We may fix the base figure and the floating ratio in advance and then levy bonus and wage taxes afterwards; therefore, it is impossible to lose control in this regard. The problem arises when enterprises misuse profits which are earmarked for other funds. This has always been the "breach of control" in the indiscriminate distribution of bonuses in the past. It is not difficult to solve this problem either by setting the ratios of various funds and transmitting them to all levels. Finally, some enterprises use such illegal means as increasing production costs under other names and methods, intercepting profits, and "evading taxes" to distribute money and goods indiscriminately among staff members and workers. It is impossible to estimate the scale and harmful effects of such practices. Judged from this, when solving the problem of losing control, we should put emphasis on the last two problems and avoid erroneous diagnoses. The loss of control of consumption funds as a result of losing control of capital construction investment is even more irrelevant to "establishing the link." In sum, we should allow further exploration and experiment on the concrete models for "establishing the link" and gradually mete out such models. During the process, we should allow failures and setbacks.

4. Suggestions for the improvement of the concrete models for "establishing the link."

With regard to the guiding principles for choosing targets in "establishing the link": 1) We should not practice "uniformity." Different regions, industries, and enterprises should be allowed to choose the targets according to their actual conditions and their own abilities. 2) We should establish a comprehensive target system with major and minor targets complementing and conditioning each other. We should not use unitary targets. 3) We should add to the target system the factor of horizontal comparison, stop "lashing the fast ox," and encourage the backward. 4) We should try to eliminate the economic results created by non-labor factors to reduce the disparity of differential incomes of enterprises. 5) We must take into consideration the relations of the interests of the state, enterprises and workers.

The Number of Workers and the Wage Bill of Recent Years in China

Year	The number of workers (10,000)	Wage bill (1 million yuan)
1978	9,499	568.8
1979	9,967	646.6
1980	10,444	772.5
1981	10,940	820.0
1982	11,281	882.1
1983	11,515	934.6
1984	11,824	1,112.3

LABOR AND WAGES

WAYS TO EXERCISE MACRO-CONTROL OF WAGES SUGGESTED

Beijing JINGJIXUE ZHOUBAO in Chinese 15 Dec 85 p 7

[Article by Zhu Bin [2612 2430]: "On the Macro-control and Adjustment of Wages"]

[Text] The loss of control over the consumption fund has attracted the attention of all circles of society. Wage is an important part of the consumption fund. Doing a good job in the macro-control of wages is a major issue in carrying out the reform of an economic system and achieving strategic goals. Suggestions in this regard are as follows:

1. Set correct targets for the control of general wage standards.

General wage standards are conditioned by the increase in rate of national income and whether wages can finally increase at a steady rate is in turn determined by the increase of the national income of the sector of the means of subsistence; therefore, it is appropriate to use the increase rate of total national income as a target for the control of general wage standards and use the increase rate of the national income of the sector of the means of subsistence as a target for the control of the structure of general wage standards.

2. Clarify orientation for the reform of the wage system.

The major defect of the previous wage system is the egalitarianian practice of "eating from the communal pot." Therefore, the main direction of the reform is to overcome egalitarianism and smooth out wage relations instead of seeking high wages and consumption. The current experiment of linking the wage bill to economic results is an effective form for overcoming egalitarianism and should continue to be carried out. However, concrete measures still have the following restrictions: 1) "uniformity"; 2) lack of horizontal comparison between enterprises; and 3) too many factors of administrative interference. From now on, we should, according to different conditions, set different targets for linking wage bill to economic results; establish a target examination system consisting of one major and many minor targets; and after conditions are ripe, severe the link between wage bill and economic results and use taxation alone to control the internal distribution of enterprises.

3. Handle well the relations between wages and prices.

The relations between wages and prices are actually relations between currency (nominal) wages and actual wages. We should implement the partial wage indexation policy so that wage standards will change as prices change. When adjusting workers' income, price subsidies and wages should be separated for the convenience of control.

4. Use the tax lever and exercise compulsive control.

Taxation is compulsory, free, and stable. At present, due to the great disparity of production conditions and management levels of enterprises, levying wage increase tax and bonus tax can reduce the disparity and eliminate non-labor income. But, it should not be simplified. Such taxes should be levied according to the different classification of enterprises and different conditions so that tax burdens are basically rational for enterprises of different ownerships, scales, and industries. As conditions ripen during the reform, such taxes should be transferred to the enterprise consumption fund tax and finally to personal income tax.

5. Use currency and financial policies to adjust and control wages flexibly.

Considering the consumption fund alone in the macro-control of wages is not enough. Since approximately 40 percent of capital construction investment is transformed into consumer purchasing power, financial policies must be used to control the scale of capital construction investment and the amount of currency issued. At the same time, strict control and social supervision should be exercised for the use of the consumption fund.

6. Reform the current wage control system and exercise multi-level control.

The state should take care of wage increase plans concerning the situation as a whole, prescribe basic systems and formulate various control and supervision policies. Local areas (and departments) should coordinate the relations of various proportions, set forth concrete control measures, and exercise effective supervision according to the policies. Enterprises should, within the limit permitted by the policies, choose various wage forms and promotion and evaluation procedures.

7. Gradually establish laws concerning wage distribution to standardize and legalize the adjustment and control of wages.

8. Establish and perfect the social security system.

Many problems in wage control are related to the imperfect security system. In order to help workers solve problems and ease worries, enterprises have done many things within the scope of the consumption fund that should have been taken care of by social security. The state should draw up a "social security plan" and establish a public accumulation fund system. The pensions of retired workers should be placed under the unified control of society. The public accumulation fund of society should consist of part of workers' wages and a proper amount of subsidies from enterprises and the state treasury.

STATE TO BUILD 11 DEEP-WATER BERTHS IN LIANYUNGANG

HK010804 Beijing ZHONGGUO XINWEN SHE in Chinese 0246 GMT 30 Apr 86

[Text] Nanjing, 30 Apr (ZHONGGUO XINWEN SHE)—China will invest 870 million yuan in the next 5 years to build 11 deep-water berths in Lianyungang. By 1990, the handling capacity of the port will reach over 20 million tons, 300 percent over that of the present.

Lianyungang is located at the eastern end of the Lanzhou-Lianyungang railway line. The investment in the construction of the port this year is 200 million yuan, ranking first among China's coastal ports.

According to Zhao Yong, a responsible person of the Lianyungang Port Construction Headquarters, the construction of the major projects of 6 of the 11 deep-water berths to be completed during the Seventh 5-Year Plan period has already started. This year, two 35,000-ton coal wharves will be put into use. The trial operation of these wharves is expected to take place in September. By the end of next year, four wharves for various goods (two 25,000-ton and two 10,000-ton wharves) will be completed. Land is being reclaimed from the sea for the construction of the other five berths at present.

Zhao Yong said that the work of dumping rocks for the construction of the Lianyungang western breakwater will start in July this year and will be completed in 1991. This breakwater will be 6.7 kilometers long and will give protection to a harbor with 30 square kilometers. In the future, over 100 berths can be built here with an annual handling capacity 1,000 percent that of the present capacity.

NEW MANAGEMENT SYSTEM INSTITUTED AT DALIAN PORT

OW300047 Beijing XINHUA Domestic Service in Chinese 1552 GMT 29 Apr 86

[Excerpts] Dalian, 19 Apr (XINHUA)—A management system with dual leadership by the central and local authorities and with the stress on the latter has been instituted at Dalian Port. A handing-over ceremony in connection with the institution of the port management system was held in Dalian today.

Entrusted by the State Council, Zhao Weichen, deputy head of the State Council leading group in charge of sea, land, and airports, presided over the ceremony. He said: Ports are instituting a management system with dual leadership by the central and local authorities and with the stress on the latter. This is a major policy decision by the central authorities and an important reform in the communication system. The State Council made this decision on the basis of the experiences of the experimental management of Tianjin Port by local authorities. This decision has two aims to achieve: 1) It is necessary to mobilize quickly the initiative of all quarters, especially the inititiative of local authorities and enterprises, to accelerate port construction and reform, to increase port handling capacities, and to raise operational and managerial levels; and 2) it is necessary to seek through reform a port management system suited to China's conditions and with distinctiwe Chinese characteristics.

LANZHOU CIVIL AVIATION BUREAU CHANGES NAME

HK301511 Xian Shaanxi Provincial Service in Mandarin 0030 GMT 30 Apr 86

[Text] Lanzhou Civil Aviation Bureau will change its name to Xian Civil Aviation Bureau. Beginning 1 May at 0000, Lanzhou Civil Aviation Bureau will officially change its name to Xian Civil Aviation Bureau.

Xian is situated in the center of the country and is a gate and fort through which people enter the northwest from all places throughout our country. Over recent years, in the wake of the quick economic, cultural, and tourism development in the northwest region, the central and pivotal role of Xian in the northwest civil aviation and transport network has gradually become more apparent.

To suit this situation, beginning 10 March, the organs of the former Lanzhou Civil Aviation Bureau have removed their main departments in two groups to Xian. In accordance with the instruction of the State Council, beginning 1 May, Lanzhou Civil Aviation Bureau will officially change its name to Xian Civil Aviation Bureau. This will surely produce a vigorous effect on promoting economic construction and facilitating the people's livelihood in the northwest region.

WAYS TO CARRY OUT ECONOMIC REFORM IN 1986 OUTLINED

Beijing LIAOWANG [OUTLOOK] in Chinese No 1, 6 Jan 86 pp 16-19

[Article by Gao Shangquan [7559 1424 0356], deputy director of the State Restructuring of the Economic System Commission: "About the Reform of the Economic System in 1986"]

[Text] In 1985 China's reform of the economic system took a brave step and made important fresh progress. The goal to regain control of the macroeconomy set forth at the beginning of 1985 has been basically achieved. The reform has accelerated economic growth, market prosperity, steady growth of state revenue, and continuous improvement of living standards. Nineteen eighty-six is the first year of the "Seventh 5-year Plan." How to carry out the reform of the economic system this year is a major issue of common concern and interest.

Recently I have conducted some investigation and research in several provinces and municipalities. Judged from the actual conditions of all areas, in 1986 we should put the reform before everything else and accelerate the planned development of socialist commodity economy. Concrete reform principles may be summarized in the following few words: "Assimilate, consolidate, supplement, improve, upgrade, and develop." In other words, we should assimilate and consolidate existing achievements and reform measures which are correct. With regard to those reform measures in which little experience has been accumulated and which lack detailed procedures and have more problems, we should carefully review them, keep what is good, discard what is bad, adopt supplementary measures to make them complete, and revise them to make them perfect. As for those reform measures which are conducive to macrocontrol, the improvement of enterprises' and social economic results, and the balance of aggregate supply and demand, we should explore, innovate, upgrade, and develop them in a vigorous but safe manner so as to make the reform more efficient and expedite the steady growth of the economy. Based on these three ideas, I put forward the following 12 suggestions and opinions for the reform in 1986.

Assimilate and Consolidate

The main task is to implement conscientiously the "10 Regulations on the Expansion of Rights" and the "14 Provisional Regulations" of the State Council, safeguard the rights and interests gained by enterprises through the reform, continue to increase the vitality of enterprises, especially large and medium-sized, and further develop various forms of horizontal economic links.

1. Consolidate various levels and categories of management companies in accordance with the principle of "delegating decision-making power to factories and serving the grassroots."

Most factory directors we contacted reflected that the phenomenon that management companies at national, provincial, and municipal levels abuse their administrative powers to intercept and encroach upon the rights of enterprises is still very serious and that it has become a major obstacle to enterprise revitalization, a loophole for stealing state revenue and transferring large amounts of budgetary funds to extra-budgetary funds, and a major cause for the loss of control over consumption funds.

The clean-up campaign currently carried out in all areas is aimed mainly at those brief case companies while management companies are still growing in number. Take those Hangzhou-based companies under the administration of ministries and provinces for example. The number increased from 188 at the end of 1984 to 234 in 1985. How do we consolidate such companies? First of all, we must coordinate companies of all categories at all levels, starting with those under the administration of central departments, bureaus, sections, and offices, draw a clear-cut line between the functions of administrative departments, and companies and sever the economic links between the two. Second, companies of all categories must abide by the principle of "equality, mutual benefit, democratic consultation, voluntary participation, and freedom of withdrawal." Chongqing City readjusted, reformed, and reorganized, according to the suggestions of subordinate enterprises, those management companies which had been established since 1982 according to the stuffing their pockets metnod, enabling them to "delegate decision-making power to factories and render service to grassroots units," become real enterprises, and establish horizontal links with other factories and enterprises to benefit both sides. Third, we may explore and develop various forms of companies such as management-service, production-management, technical service, and the combination of various forms and ownership systems. Fourth, we must hold on to the policy when consolidating companies, avoid "uniformity," and ensure the effect of "killing two birds with one stone."

2. Earnestly reduce enterprises' burdens and increase enterprises' ability to transform and develop themselves.

The average profit retention rate of all enterprises in China increased through the second step of the tax-for-profit reform, but the following price increase of raw materials and various charges and fees increased the burden on enterprises. One of the problems is that the sharp increase in the prices of raw materials made it difficult for enterprises to bear the heavy burden resulting from high costs and low sales. The Hangzhou City Toothpaste Plant is a model enterprise of the light industry and its economic targets are on top of the list among all departments of the same trade in the nation. Since 1985, its profits have been reduced by 5.13 million yuan due to increases in the prices of major raw materials, tax rates and various charges, and the levying of urban development tax. Although such measures as conservation, substitution, and expansion of sales by enterprises have been employed, the enterprise could only offset half of the reduction and recorded a 56 percent decline in annual profits, thus affecting the income of staff members and workers. The second problem is that in 1985, enterprises had to take care of substantial increases in price subsidies for non-staple foodstuff, allowances for the education of staff members and workers, and pension. The third problem is that some administrative organs charge illegal fees for regular administrative services or collect additional "service charges" on top of regular fees. The fourth problem is the phenomenon that enterprises are forced to "pool funds," share expenses, sponsor projects, and do commercials, and this is very serious. In some areas, local public security departments even charge factories for setting up police stations in large and medium-sized enterprises, hiring police, and purchasing uniforms, guns, and other police equipment.

With regard to the above problems, on the one hand, we should solve them through price readjustment and the reduction and exemption of regulatory taxes; on the other hand, we should adopt measures to reduce unfair burdens on enterprises. Auditing, financial, and tax departments should be organized to reexamine and verify all items of charges and fees and resoutely eliminate those which should be eliminated. Administrative organs should not be allowed to charge enterprises without authorization. It is necessary to stipulate in unequivocal terms that collecting service charges for public service is illegal. Misuse of enterprises' staff and unauthorized apportionment of expenses and other fees should be checked.

3. Consolidate the achievements in the reform of small state-run enterprises

Over the past year or so, some small state-run enterprises, especially small commercial enterprises, have been invigorated through "transformation (into collective ownership), transfer (to collective management), and rent (contract or rent to individual managers)." They are now developing into economic entities that practice independent accounting, assume sole responsibility for their own profits and losses, and make their own decisions in management. This has aroused the enthusiasm of staff members and workers and substantially increased economic results and the efficiency of social service. In 1985, reformed small enterprises in Hangzhou and Jiaxing cities both showed an increase of over 35 percent in tax payment as compared to the corresponding period of the previous year. However, comrades in all areas now express that due to policy changes, the momentum of reform in small enterprises has been reduced sharply. The main problem is that not enough consideration has been given to such enterprises in the formulation of tax policies or other reform measures.

Some comrades of local governments pointed out that enterprises owned by the state and run by collectives are different in economic nature from those small enterprises which are transferred directly to collective ownership; therefore they must be so distinguished in policies. Some comrades suggested that "uniformity" be avoided in the levying of bonus tax; small enterprises dealing with cartering, service, repairing, and vegetable businesses be given more lenient treatment in regard to the cut-off point; the staff members and workers of small enterprises be given over-time pay; and rented or leased small enterprises be exempted from bonus taxes.

Supplement and Perfect

Since the beginning of 1985, in view of certain unstable elements in China's economy, the central government has enhanced macroeconomic control and employed such economic levers as taxes, credits, prices, and wages. This is totally necessary and has scored achievements. But, it is necessary to prevent "uniformity" and avoid two possible dangers: 1) The application of old methods is liable to lead us back to the overcentralized old system; and 2) general means of control can control state-owned enterprises but not collectively-owned and individually-owned enterprises; they can control production but not consumption, thus enlarging the gap between aggregate supply and demand. Therefore, it is necessary to supplement and perfect all systems. The first main step is to establish a mechanism to make comprehensive use of economic levers and exercise indirect control over the macroeconomy, give correct guidance regarding investment orientation and enterprises' behavior, and bring about the balanced and coordinated development of the economy.

4. Further improve financial and tax systems

First of all, we must make sure that all taxes that can help bring the scale of capital construction under control and promote fair competition among enterprises are collected without fail. For instance, product taxes are an important source of revenue for the state, but some provinces and municipalities, in order to protect their local enterprises, have reduced or exempted product taxes for some products in excessive supply and encouraged enterprises to enter competition through illegal means. This in fact is protecting products of high costs and low quality.

Second, measures that can help increase the economic results of enterprises and the society as a whole should be implemented as soon as possible even if it means less taxes for the state. The Hangzhou Rubber Plant is one of the units with better economic results in the same industry throughout the country. In the past few years, it has increased production and practiced economy and its workers have been paid 3 yuan a month as conservation bonus. In 1985, Zhejiang's financial and tax departments required that this enterprise retain conservation bonuses according to its average consumption level of the past 3 years. As a result, the bonus was reduced to 0.2 yuan while enterprises of high consumption were allowed to retain more bonuses. In this way, it is very difficult to arouse the enthusiasm of staff members and workers. Therefore, we must work out as soon as possible some appropriate measures regarding the practice of conservation bonuses.

Third, we should begin as soon as possible to levy personal income taxes to replace bonus taxes. This can control the growth of consumption funds, help promote fair competition between enterprises, and control the excessively high income of individual business managers.

Fourth, the reduction and exemption of regulatory taxes should be planned in such a way to reflect the industrial policy laid out to develop key industries.

Fifth, we suggest that the separate tax system be carried out on a trial basis in a few cities in 1986. Through this separate tax system, we should correctly handle the interests and rights of the state, provinces, and municipalities, practice decentralized management, and gradually enhance and perfect the system of tax supervision.

5. Correctly employ the means of credit, open up capital markets, and exercise indirect control over the macroeconomy

To exercise indirect control, it is necessary to give correct play to the role of monetary and currency policies. At present, enterprises are slow in responding to the adjustment of interest rates. Since state-run enterprises include their interest in their cost of production, they are willing to borrow money no matter how high the interest rate is.

To bring the overall scale under control, first of all we should strictly control the number of new projects and sort out projects under construction. Second, we should avoid "uniformity" and mixing reward with punishment in the control of overall scale. Third, under the condition of tight money supply, it is still more necessary to open up money markets, accelerate turnover, and make better use of limited funds. Vigorous efforts should be made to develop horizontal capital circulation between regions and between specialized banks, adopt various credit instruments, reform the means of payment, develop multi-level money markets, and control the growth of high-interest credit among the people. Fourth, it is necessary to increase the efficiency of loans and speed up the recovery of investment. The key to this issue is that leaders at all levels should avoid using administrative means to issue orders so as to protect the decision-making power of banks.

6. Carefully control the prices of non-staple foodstuff to stabilize markets and reassure the people

Beginning in April 1985, all localities have gradually decontrolled the prices of non-staple foodstuffs and granted a proper amount of price subsidies. After price decontrol, commodity prices have gone up substantially, resulting in quite a few complaints from the masses.

In order to control commodity prices, stabilize markets, and reassure the people, we suggest that the following measures be adopted: 1) Strengthen price and market control. Implementing the principle of "macroeconomic control and microeconomic flexibility," Shanghai Municipality continues to subsidize popular vegetables of dependable quality. Hangzhou and Jiaxing cities have adopted such methods as setting price ceilings and allowing units of the same trade to negotiate prices. Chongqing City is in the process of formulating a lowest price protection policy. 2) Adopt measures to consolidate and develop vegetable production bases and households specialized in raising hogs so as to guarantee absolute supply. 3) Further implement measures to supplement agriculture and vegetable production with industry in rural areas. 4) Establish vegetable wholesale markets with state-run commercial units playing the dominant role. 5) Correctly handle the relations between the interests of producers, dealers, and consumers.

7. Explore new ways to reform the wage system of enterprises

Following the reforms of government organs, cadres, and other establishments, enterprises' wage reform became a prominent contradiction. The method of linking wage bill to economic results, which has been practiced on a trial basis since 1984, is correct. However, the problem is how to set scientific and reasonable targets for economic results. It is inappropriate to publicize this method before the problem can be solved.

To explore new ways to reform enterprises' wage systems, Shanghai is planning to experiment with the method of linking the wage bill to tax payment, profit delivery to the state, cost of production, and quality in several enterprises in 1986. Chongqing City is planning to experiment with the "target cost distribution method" in some enterprises in 1986. This method is to encourage enterprises to increase the wage content of production cost by reducing consumption on the prerequisite of guaranteed product quality and increased tax payment and profit delivery to the state. On condition that the total amount of consumption funds is under control, enterprises should be given the decision-making power to choose their wage systems and explore multiple distribution systems. In the meantime, attention should be paid to preventing new breaches in the expansion of consumption funds.

Upgrade and Develop

It is necessary to carry out reforms in a firm, cautious, and reliable manner. Pilot cities in particular should make new strides to push forward all-round reforms.

8. Vigorously create conditions to explore and develop capital goods markets

Along with the changes in the form of distribution and allocation for capital goods and especially since the gradual price decontrol of above-plan capital goods was initiated at the beginning of 1986, two forms of prices--planned and market prices--have appeared for major capital goods. At present, the disparity between the two prices is enormous. This applies mainly to those products whose prices have long been divorced from their value and whose supply falls far short of their demand. This dual price system can not only give impetus to enterprises producing capital goods but also impose pressure on general processing enterprises, enabling them to increase production, practice economy, and readjust industrial lineup and investment orientation. In these two areas enterprises have made great efforts in the past year or so and proved that the dual price system is of positive significance and it serves as a bridge linking the old to the new system. But some enterprises are unable to cover excessive price disparity, resulting in price increases or causing all units to vie with each other in dealing with capital goods and seek profits through speculation.

To provide a relaxed environment for the development of capital goods markets in 1986, we should first take a further step to reduce the scale of capital construction and control the orientation of loans. Second, the main task now is to explore and develop steel product markets. The key is to gradually increase the proportion of goods entering the market in an effort to stabilize prices. In 1985, Shijiazhuang experimented with the method of selling planned and above-plan steel products at the same market price with price disparity returned to enterprises according to planned targets. This is an invention. It can help enterprises dealing with capital goods consider all resources, both planned and above-plan, as a whole, participate in market regulation and exercise their role in stabilizing prices. In addition, it can help smooth out the price relation of steel products by reducing the disparity between the two prices. We may continue to explore similar methods in various cities. Third, we should establish special steel product markets. Transactions of steel products of all kinds should be strictly forbidden outside the markets, but certain flexibility should be allowed in prices. Fourth, the state should issue special licenses for dealing with steel products, define business scope, and gradually establish unified and open steel product markets.

9. Mete out special policies for export enterprises to increase their ability to earn foreign exchange

According to our surveys, the key to increasing export potential is to mete out policies for enterprises. First of all, under the guidance of unified state policies, qualified enterprises should be granted as soon as possible the right to make direct contacts with foreign countries. It is necessary to establish in the guiding principle the concept that enterpreneurs must face international markets.

Second, policies should be formulated to encourage exports. Currently, many enterprises find that the more products they export, the less profits they make. Under the circumstance that domestic sales are better than exports, most foreign trade enterprises need domestic sales to supplement exports. Shanghai Municipality is considering establishing an export reward fund while demanding that enterprises, instead of foreign trade departments, be exempted from export product taxes.

Third, foreign exchange sharing quotas should be fixed for enterprises which have engaged in exports and earned foreign exchange and, according to the amount of foreign exchange earned from exports, some industries should be selected to implement the dynamic profit retention system on a trial basis. The practice of importing raw materials at low prices and selling them to enterprises after adding high service charges must be changed.

Fourth, industrial policies should be employed correctly to speed up the renovation and transformation of foreign trade enterprises.

10. Exercise decentralized control, develop the role of central cities, and ensure both macroeconomic control and microeconomic flexibility

Shanghai and Hangzhou cities have established a system for different departments to hold joint business meetings and economic lever coordination meetings which have made a positive effect on macroeconomic control. However, they feel that because cities' authority to use economic levers is too limited and they lack regulatory means, economic levers still cannot give much leverage in reality. Practicing decentralized control, policy-making, and management is a major pressing issue in the reform. On the one hand, with regard to macroeconomic control, central cities should exercise their role as a "transformer" or "second relay" and, in view of their local realities, work out the details and local versions of the general principle and policy of state macroeconomic control, thus exercising macroeconomic control in the microeconomy. On the other hand, since cities have direct contacts with enterprises and markets, they have faster information feedbacks and it takes them less time to make policy decisions. Decentralized control and management with each level assuming its own responsibility can reduce the burden and risk on the part of the central government in making policy decisions and is favorable to arousing the enthusiasm of all fields and carrying out the reform in a vigorous and safe manner.

Main reforms to be carried out in this field are: 1) Plan to practice decentralized management. 2) Properly expand the authority to readjust taxes. Cities should have the authority to readjust the regulatory taxes of enterprises on condition that they guarantee the fulfillment of revenue delivery task and the total amount of tax payment. Provinces may give cities the authority to grant tax exemption and reduction or write off outstanding tax payment. Cities may gradually begin levying local taxes such as property taxes and vehicle and vessel license taxes. Pilot cities may determine temporary tax categories in view of problems in their economic development. Chongqing City initiated the "temporary business tax" in 1985 and used it to levy taxes on upstarts in the field of circulation, achieving satisfactory results. 3) Properly expand the authority to set prices. Except for those commodities whose prices and other non-commodity charges are set in a unified manner by the state or provinces, commodity prices and non-commodity charge standards should be controlled and readjusted in a unified manner by cities. The authority to examine and approve floating prices for high-quality products may be exercised by cities within the limit prescribed by the state. In addition, with regard to the fields of credit fund control, wage control and foreign trade, the role of cities should also be developed in accordance with the principle of decentralized control.

11. Explore new systems for industrial control

Along with the simplification of administration and the delegating of decision-making powers to lower levels, government organs need to take a further step to change their functions and eliminate barriers between central and local authorities. Judged from the findings of our surveys, we may strengthen the exploration of industrial control in the following two respects: 1) Specialized industry control bureaus under city governments should switch from departmental control to the control of industry as a whole. 2) In view of the problem that some departments are in charge of too many industries, we should establish and perfect associations for each industry and enable them to become a bridge and link between the government and enterprises.

We suggest that the possibility of experimenting with the control of industry as a whole in departments with foundations such as machine-building and building industries should be further explored in several cities in 1986. During the experiment, attention should be paid to the following: 1) The control of industry as a whole should not change the affiliation of enterprises without authorization. Special attention should be paid to properly handling the relations between enterprises of different ownership. 2) Industrial control departments should cut their economic links with enterprises. 3) Industrial associations must be established in a cautious and proper manner after experimentation and exploration. We should not rush headlong into it and consider associations as new organs to replace the functions of corporations. Resolute efforts should be made to prevent turning "corporate fever" into "association fever."

12. Do a good job in basic work and make full preparation for making important steps in the reform of 1987

In order make important steps in the reform of 1987, we must do a good job in the feasibility study of the following reform plans and basic work: 1) Study and draw up important reform plans such as plans for financial reform and the development of money markets; study and draw up plans for rent reform and housing commercialization on the basis of experimenting with housing commercialization in several cities; further reform the plans of circulation systems to adapt to the new situation of a booming commodity economy in urban and rural areas; implement preliminary social security reform plans and conscientiously carry out comprehensive and supplementary reforms on a trial basis in selective units. 2) Pay special attention to basic work such as conducting appraisals and classification of assets, resources, and land and propose that this work be considered an important content of industrial survey. Other basic work includes establishing and perfecting financial accounts, accelerating the training of accountants and auditors, examining the credentials of accounting personnel, enforcing strict accounting disciplines, and establishing accounting offices on a trial basis in cities where conditions permit. 3) Strengthen ideological and political propaganda and education during the reform period and deepen the understanding of cadres and the masses for the need and difficulty of reforms. 4) Enhance the economic legal system and supervision and do a good job in supplementing and coordinating reforms so as to ensure smooth progress for reform of the economic system.

NATIONAL POLICY AND ISSUES

ECONOMIC REFORMS, SPEED OF ECONOMIC DEVELOPMENT

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] ion Chirese No 11, 4 Nov 85
pp 2-5

[Article by Liu Hongru [0491 7703 0320]: "Economic Reform and Speed of Economic Development; Study and Learn from National CPC Congress Documents"]

[Text] The recently convened National CPC Congress has approved the "Central Committee's Proposals for the Seventh 5-Year Plan for National Economic and Social Development" which affirms the guiding philosophy, goals, strategy and important policy measures underlying the economic tasks for the period of the Seventh 5-Year Plan. It also lays out concrete goals, requirements and practical steps that need to be taken in bringing to fruition the decisions of the 3d Plenum of the 11th CPC Central Committee regarding the economic structure. In the construction of a socialist state, the experiences since the 3d Plenum have been a step forward toward realizing a socialism with Chinese characteristics. We must meld the construction of a socialist state and the reforms, study conscientiously and gradually realize these goals. In this article, the economic reforms and the speed of development will be discussed; I will draw from my own learning experiences.

I. Reform Has Accelerated Economic Growth

Since 1979, China's economy and society have undergone important changes, and the trends are a step in the right direction. It can now be said with certainty that the economic and financial circumstances have basically taken a turn for the better. The main indicators are: 1) A stable foundation, a rapid growth of the agricultural sector, self-sufficiency in food, a surplus in cotton, and a steady growth in the energy supply after a period of no growth. 2) The appearance of proportion and coordination between agriculture, light and heavy industry, and between spending and savings. Markets are supplied more abundantly and daily life has seen a marked improvement. 3) A basic balance. The tide has turned from falling to steadily rising government revenues; receipts and expenditures are basically balanced as are foreign exchange receipts and expenditures. Necessary reserves are being maintained, credit is growing quickly, and the money supply is adequate to meet the demands of economic growth. These three points add up to one thing, and that is that China's economy has begun to see continuous, steady and coordinated growth.

Comrade Deng Xiaoping has pointed out; "The 7 years since the 3 Plenum of the 11th CPC Central Committee has been the greatest, most crucial era since the People's Republic was founded. In truth it did not come easy. We accomplished two important tasks: First we rooted out the opposition and second we restructured the entire system." Most fundamental was rooting out the opposition which entailed redirecting the party's focus toward establishing a modern socialism and upholding a foundation consisting of four fundamental principles; it also meant concentrating on the development of socialist production and the rectification of "leftist" errors. Without this, today's situation would not be so good. The overall restructuring of the economy and the development of production capabilities has fostered deep changes in the economy, society, manner of work, and the social atmosphere.

That the economic reforms have propelled many aspects of economic development has been clearly manifested: In rural areas the creation of the output-related system of responsibility has actively rechanneled the productivity of vast numbers of peasants. Since 1981, the annual average rate of growth in agricultural production has been 10 percent. Since the 3d Plenum of the 11th CPC Central Committee, the reforms have focused on urban areas. Because of the appearance of a mixed economy, economic diversification, a variety of circulation channels, increased self-management rights, gradual reform of the price structure, the financial system, and tax collection as well as the formation of technological and resource markets and the diligent advancement of the open door policy, the urban and rural economies have been invigorated and the growth rate has accelerated. During the Sixth 5-Year Plan, the average annual growth rate in gross output value of industry and agriculture exceeded 10 percent, already higher than the 7.2 percent average annual growth rate required to quadruple output by the end of the century.

II. Excessively High Growth Rate Are Detrimental to Economic Reform

Economic growth rates are restricted by objective conditions. If the rate is too high, steady and coordinated growth is sacrificed; thus the condition and environment best suited to restructuring the economy are lost. At bottom, the reforms exist for the construction of the economy and, in the era that lies ahead, this construction schedule depends on the implementation of beneficial reforms. If overly speedy development is pursued, all aspects of the economy will become hamstrung and it will be difficult for the reforms to advance smoothly. Why is this so?

First, the restructuring of the economy requires coordination and a steady pace of growth as a foundation. If the rate is too high, coordination is lost. In 1984, gross industrial products increased 14 percent over the previous year and up to July of this year, the growth rate was 22.8 percent higher than the same period last year. This kind of speed cannot be maintained, for it would be difficult to supply enough energy, raw materials and transportation to meet the needs of such a high rate. Comrade Chen Yun is right when he says that a proportional, planned pace of advancement is the best speed. Otherwise, panic will ensue and loss of control will unavoidably reappear, resulting in the opposite--sluggishness. "Haste makes waste." If control and coordination of the economy are lost, positive reform measures will be difficult to achieve, well nigh leading us back to where we started.

Second, the restructuring of the economy requires the gradual establishment of an indirect system of controls, the gradual perfection of a market system, the application of crucial economic and legal devices, and utilization of market mechanisms to control and adjust the economy. To achieve these requirements, economic relationships must be clarified and smoothed out so that the various means of adjustment obtain precise results. To apply economic means of adjustment is really to influence results, which will affect the profits and losses of all enterprises units and individual enterprises. On the one hand, enterprises really need stimulation to become relatively independent producers and managers; on the other hand, pressure is necessary, most notably market pressure. If an enterprise's goods are not up to par in quality, design, color, and variety, or if it uses resources inefficiently, causing high prices, the products will not sell. The enterprise and the individual will hence suffer the consequences. Under these circumstances, market mechanisms and economic forces will promptly come into play. If the economy is growing too fast, demand will inflate, supplies will become tight, and a sellers market will come into being. In this kind of abnormal situation, anything can sell and any kind of business can earn money, causing market mechanisms to lose their vitality and economic devices to become ineffective.

Third, the restructuring of the economy requires a stable financial situation, stable markets and tranquility in domestic life. And to implement all these improvements, a stable political atmosphere must be maintained. If the economy grows too quickly, the tendency is for credit to expand greatly. Above all, if fixed capital investment grows wildly, not only will it result in shortages of both building materials and mechanical equipment, but it will also result in an inflation in consumption funds. Meanwhile, in the short run this sort of investment cannot provide commodities for society at large, which then forces banks to increase the supply of money, which in turn increases pressure on markets. If the amount of money in circulation increases, goods will become scarce, production will increase haphazardly, causing quality to fall, and eventually a glut will occur. Goods would become wasted products and money in circulation would gain great purchasing power. The result could be inflation, rising prices and impediment to the reforms. And if it affected everyday life, causing people to become disheartened, it would be even more difficult to implement the reform.

Thus, it is imperative to maintain a suitable rate of growth. Excessively speedy growth cannot be pursued for its own sake, nor can national capabilities be ignored while blindly expanding the scale of development. We must avoid blindly heading in this direction and must avoid an economic panic. According to the proposals of the Central Committee, during the Seventh 5-Year Plan The GVIAO is set to grow at an annual rate of 7 percent, which is hardly a low rate. To bring this about, the Seventh 5-Year Plan will be divided into two parts. During the first 2 years, emphasis will be placed on controlling aggregate demand, slowing speedy growth rates, and solving the problem of overly large-scale fixed-asset investments and wild growth in consumption funds. The scale of investment for 1985 will be maintained. By and large, only minor adjustments will be made. In the last 3 years of the Seventh 5-Year Plan, there will be an appropriate increase of investment in construction. The principle is firmly established, yet the mere recognition of the problem does not mean a genuine solution, for measures are still inadequate and uncontrollable dangers are still in existence. Some comrades cannot get the concept of "the more growth, the better" out of their minds. At the same time, reducing waste and improving product quality to increase economic gains is quite difficult to attain. After all, it is so easy to rely on an expanded scale of production to obtain higher output value. Consequently, it will be difficult to solve the problem of excessively fast growth.

III. Reforms Must Have Priority

During the Seventh 5-Year Plan, we must take note of three important tasks: 1) to create an excellent environment for the reforms by avoiding overly fast growth in the economy; 2) to strengthen priority projects and technical transformation to pave the way for continued economic growth in the 1990's; 3) to continue improving daily life for the people. The latter two responsibilities require a definite rate of growth, because sluggish growth is also unacceptable. On the surface this is a contradiction, but in reality it is consistent, for only when economic benefits and the general welfare are satisfactory can a growth rate be considered perfect. This is precisely the purpose of the reforms and it is also a necessary condition for the reforms. As Comrade Xiaoping has said: If within the next 5 years the foundation for the reform is set, the economy will be able to grow steadily and in a coordinated fashion so that by the end of the century the 12 major goals will be well within our grasp."

How can the contradictions of the Seventh 5-Year Plan be solved to ensure suitable levels of growth? The means is in the reforms.

A suitable growth rate is one in tune with the general welfare and one that truly comes to grips with the quality versus volume and speed versus results relationships. The problem of resource waste, inferior quality, and low economic gains must be altered so that all resources are efficiently utilized, investment is more productive, exports are increased, and the people's needs are satisfied. The effort to increase economic gains and the active strengthening of exports are two means of creating the right environment for the reforms during the Seventh 5-Year Plan. We also must make future growth a source of lasting strength as well as solve the important contradictions in daily life. In accomplishing these two things, we must institute various policies and measures, the most important being the proper implementation of the reforms. It is especially important to invigorate large and medium-sized enterprises, make it easier for government to grant rights, appropriately reduce and adjust taxes, reduce planned duties and directions, further increase self-management rights and competitive pressure on enterprises, etc. Enterprises must be inspired from both within and without to increase economic benefits. There must be a further development of commodity markets as they can function as economic levers and competitive mechanisms, to separate the wheat from the chaff. Reforms in the price structure, in tax collection and in the financial system should serve to strengthen market mechanisms and economic levers, and will result in greater economic gains for enterprises and society at large.

A suitable growth rate is one that allows for proportional growth. The conditions required for a stable, proportional, and well coordinated economy are a basic balance between aggregate supply and demand that will help keep accumulation and consumption funds in the right proportion, and an integrated balance between public finances, credit, goods, and foreign exchange. To bring this about, we must promote economic reform and the nation's planned commodity economy must be adjusted to perfection so that macroeconomic controls are effective and the microeconomy is stimulated. A stimulated microeconomy is the foundation for macroeconomic control, precisely because stimulation necessitates control. If effective macroeconomic controls are lacking, then the more the economy is stimulated, the more chaotic it will become. In the future, direct state control over enterprises must be gradually reduced and a system of indirect control must be perfected. Legal and economic means must be employed to control and adjust movement. However, the scope, degree, and pace of this reduction in direct control over the microeconomy should adapt to and complement the strengthening of indirect state control. It is worth noting that implementing controls is an important aspect of the reforms, and it should be gradually perfected throughout the reforms. There is no returning to the days of direct control through primarily administrative means.

Controlling the scale of fixed-asset investment is the most direct component in establishing a suitable growth rate, for it prevents the inflation of demand brought on by "surging investment." This is the core of macroeconomic control, but it is a difficult problem. For many years purely administrative means have failed to solve this problem, and now as part of the reforms, effective, but indirect solutions are being sought. Besides maintaining outside of a certain planned scale of control it is important to employ economic devices, especially in the realm of the money supply, for increased control and guidance.

If there is a rush to obtain capital for basic construction, authorized banks must reduce the flow of capital and other loans. Stock and bond issuances need to be put under better management and direction. Also, restrictions on tax collection can be increased. Drastic methods of control may be employed to institute this necessary series of reforms because they are so necessary.

In order to set up macroeconomic controls, appropriate reform measures in line with the Central Committee "proposals" must be instituted. In the first 2 years of the Seventh 5-Year Plan, the emphasis of the reforms will revolve around the stabilization of the economy and the perfecting of an indirect system of macroeconomic controls. The last 3 years will revolve around the need to expand socialist commodity markets, improve indirect controls, establish a price structure for production resources, restructure the pricing and managerial systems, improve the tax system, reform the financial structure, and provide better external conditions for enterprises.

The reforms are only one of the three great duties of the Seventh 5-Year Plan, but it is the most significant one. The relevance of the reforms is not limited to the present. They are a crucial foundation for the establishment of a stable, expanding economy during the rest of the century and the first half of the next century. Without the reforms, there cannot be stable economic growth in the future.

IV. Restructuring Financial System Has Important Place on Agenda

If we want to strengthen macroeconomic controls and stimulate the microeconomy, it is necessary to restructure the financial system. The three main aspects of the Central Committee's concrete "proposals" regarding the establishment of a new style socialist economic structure are: the invigoration of medium-sized and large enterprises; the development of planned commodity markets and the gradual perfection of a market structure; the substitution of indirect for direct national control in the management of enterprises. Revolving around these three aspects is a comprehensive, well-planned structure comprised of price, public finance, banking, and wage systems that together form a complete market establishment. There also should be mechanisms to merge macroeconomic control with microeconomic stimulation. As can be seen, the heart of the reforms is determining how to establish and perfect a system of adjustments for a planned, socialist commodity economy. A regulated banking system is an important component in a regulated economy. The reform of the banking system is connected to both the stimulation of the microeconomy and to macroeconomic controls. The invigoration of enterprises, the perfection of the market systems, and the establishment of a system of indirect controls all require suitably tailored reforms in the banking system. And if we want to manage the relationship between growth rates and economic results, banking methods must be utilized.

Regarding reforms in the banking structure, the Central Committee "proposals" laid out a simple, precise outline. It reflects several important relationships: the relationship between banking and the national economy clearly expresses the important role of banks. There are two main aspects to this role: the first is the raising of funds and the efficient application of funds to suitable projects; the second is to direct the flow of money, regulate both the economic structure and aggregate demand to realize the needs of national policies and strategies. The role of banks must be tailored to the needs of economic development and they must be able to restrain a speeding economy that is not well coordinated. The two aspects mentioned above must be viewed as an organic whole that cannot stand alone as separate components.

In regard to the relationship between the Central Bank and various other departments and financial institutions, the People's Bank of China is by law consigned the means to effectuate the duties and spirit of the Central Bank. The People's Bank is definitely the most important institution for making macroeconomic adjustments. Its adjustment duties and goals are: to control inflation and to stimulate coordinated economic growth and a rational economic structure as well as to adjust aggregate demand and the economic structure. For this purpose, the independence and prestige of the People's Bank of China must be strengthened. It must not become a mere appendage of various government departments, because it must independently execute its professional prerogatives. The means of adjustment at its disposal include integrated credit planning, financial policies, the management of foreign exchange and credit, interest rates, exchange rates, reserve fund and various other economic and legal devices. What makes unequivocal the People's Bank of China's role as the Central Bank's connection with specialized banks and other financial institutions is its leadership duties, for it has the right of supervision, examination, and the power to adopt compulsory measures to control their credit activities.

As to the internal and external workings of specialized banks, the People's Bank can determine and maintain the direction of enterpreneurial reform, carry out the separation of government from enterprise management, and set up the responsibility system. It can also approve the limits of suitable banking services as well as give impetus to and apply pressure on banks to work hard on upgrading management. But because it is involved in a wide range of affairs and it lacks experience, steps must be implemented with care.

Regarding the relationship of banks and enterprises, banks have the unequivocal right, based on national plans and credit policies, to decide whether or not to extend loans and to determine how much to lend enterprises. These are self-management rights of banks. Banks do not have the obligation to "guarantee" funds needed by enterprises. At the same time, however, banks must bear the risks of the loans they extend.

Concerning the relationship between banks and government, it is expected that all levels of government will supervise and support banks in their efforts to carry out the nation's financial policies, but it must also guarantee that there is no encroachment upon the legal rights of banks. Banks have the right of self-management, so units and individuals cannot compel a bank to extend loans in defiance of policies.

Indirect financing (through banking institutions) rather than direct financing (through enterprises and individuals) will be the principle form of financing. Direct financing will also be allowed, but as a supplement. The "proposals" suggest that in managing and directing, the People's Bank of China should employ a variety of financial methods to actively develop the lateral flow of funds and promote the gradual formation of a money market.

Reforming the financial structure is a complex matter involving the overall situation; therefore, it must proceed with caution and prudence. Among the "proposals" are many important points that necessitate research into theoretical and practical problems. We must diligently study, draw from years of experience and proceed one step at a time.

NINGBO PLANS CALL FOR 'SECOND SHANGHAI'

OW242020 Beijing XINHUA in English 1444 GMT 24 Apr 86

[Text] Beijing, 24 April (XINHUA)--Major port expansion schemes have been started at Beilun and Zhenghai ports in the eastern coastal city of Ningbo, Zhejiang Province, today's PEOPLE'S DAILY reported.

Two electricity power plants and an airport are being built. Construction of a computer-controlled telephone exchange service and other telecommunications, industrial, tourist and cultural facilities are all being speeded up.

The newly-built Ningbo University is expected to enroll students later this year, the paper said.

Planners aim to build Ningbo into China's "second Shanghai"--the country's largest port.

Investment for the city's major projects during the Seventh 5-Year Plan (1986-1990) will exceed the total figure of the previous 30 years. The central and local authorities have decided to spend 5.2 billion yuan. If all planned projects are finalized, the investment will exceed 13 billion yuan, 60 percent of which will be in foreign funds.

Officials of the State Council and local authorities and Sir Yue-kong Pao, chairman of the Hong Kong Worldwide [?Shipping] Group, discussed on Wednesday in Beijing a program for Ningbo's construction over the next 5 years.

The emphasis will be on developing deep-water wharfs and land transport facilities to lay a solid foundation for building Ningbo into an important industrial city and economic center.

QINGDAO INCREASES PRODUCTION VOLUME OF EXPORTS

OW150955 Beijing XINHUA in English 0728 GMT 15 May 86

[Text] Qingdao, 15 May (XINHUA)--The volume to purchase export commodities in Qingdao came to more than 384 million yuan in the first 4 months of this year, 50.2 percent higher than the same period of 1985 or hitting an all-time high.

The volume of exports totaled 992 million yuan in 1985, with an increase of 11.7 percent of 1984. About 400 varieties of exports made in Qingdao, one of 14 coastal cities opening to the outside world in 1984, included food and oil, textiles, light industrial products, chemical products, handicrafts and soft drinks which found their market in 120 countries and regions in the world.

One of the most welcomed drinks was beer made in Qingdao Beer Brewery, providing about 100 million liters annually. About 47 million liters of beer were exported, thus earning 16 million U.S. dollars in 1985. And the volume of beer export came to 8.7 million U.S. dollars since last January.

In order to make fuller use of its favorable conditions and potential, and improve the quality of exports, the city government declared more than 30 special factories to produce for the international market. And the priority will be given to them.

Meanwhile, 6 counties of the city also set up 32 export production and processing centers which provided export products worth about 120 million yuan in the first 4 months of this year.

BRIEFS

DEVELOPMENT PLANS REPORTED--Fuzhou, 14 May (XINHUA)--Fujian Province in east China will focus its development efforts on transport and energy power during the Seven Five-Year Plan period (1986-90). Speaking at the Fifth Session of the Sixth Provincial People's Congress which opened today, Governor Hu Ping said that two hydroelectric power stations and two thermal power plants would be built, which would add an installed capacity of more than 1.35 million kW. Then the annual electricity output will reach 11.4 billion kWh in 1990, an increase of 49 percent over 1984, Hu Ping said. During this period, the annual coal mining capacity will increase by 1.6 million tons, the governor said. On the development of communications, he said that a new electric railway of 514 km and 11 deepwater berths will be established. At the same time the construction of a section of a road linking Fujian with Jiangxi and Hunan provinces will be completed. He said that over the past five years the province has imported basic facilities to improve its transport and the power industry. As a result, harbor handling capacity of 2.14 million tons, coal mining capacity of 560,000 tons and installed power capacity of 406,000 kW have been added to the province. AGGREGATE ECONOMIC DATA

BEIJING SHOWS ECONOMIC, SOCIAL DEVELOPMENT RESULTS

HK100510 Beijing CHINA DAILY in English 10 May 86 p 1

[By staff reporter Nie Lisheng]

[Text] Beijing municipality registered all-round success in its economic and social development over the Sixth 5-Year Plan period (1981 to 1985), it was announced here yesterday.

Total product income in increased by nearly 60 percent to 19.4 billion yuan, the annual averaging 2,040 yuan per capita, second only to Shanghai of all 29 municipalities, provinces and autonomous regions in the country.

Inflation-adjusted figures show that average workers' wages rose by 34.4 percent to 1,343 yuan, while suburban farmers' income more than doubled to 775 yuan in 1985, both figures marking the largest increase of all five plan periods since 1953.

At a press conference held yesterday to brief reporters on next week's Fifth Session of the Eighth Municipal People's Congress, Director Xu Yiliang of the city's Statistical Bureau announced that total industrial and agricultural output value had jumped by 51.5 percent to 34.96 billion yuan in the past five years at an annual growth rate of 8.7 percent, more than double the 4.3 percent rate originally set.

The city's total road mileage reached 2,979 kilometres by the end of 1985 after more than 500 kilometres of highway were built or extended, while the number of buses or trolleybuses increased by 1,480 to 4,593 with a total annual haulage of 3.34 billion passengers, 40 percent more than in 1980.

During the same period, the city nearly quadrupled the number of its taxis to 12,000, operated by more than 200 taxi companies, while 359 mini-buses have also been put into operation since 1984, carrying more than 3 million people.

Six large-scale fly-overs, seven road bridges and 14 pedestrian subways have also been constructed to ease traffic congestion at major crossroads, said Xu, who revealed that the municipal government spent a total of 2.92 billion yuan on public works construction in 1981-85, nearly double the figure for the previous 5-year period.

By the end of 1985, Xu said, 1.023 million households had gas supplies while water pipelines now served every building or courtyard. Central heating coverage has increased from 5.64 million square metres in 1980 to 9.16 million square metres in 1985.

An even larger investment of 5.17 million yuan was channelled into housing construction during the past 5 years, when the city constructed nearly 22.7 million square metres of floor space.

Unemployment dropped from 1.6 percent in 1980 to nearly zero in 1985, when the city employed a total workforce of 3.8 million, 558,000 more than 5 years ago.

Tourism and joint venture businesses have been flourishing in the city, Xu said. Last year, Beijing received a record of 937,000 international tourists and had a total tourist income of 940 million yuan in foreign exchange. The number of overseas hotels nearly tripled to 63, with 16,000 rooms and 32,000 beds.

MINORITY NATIONALITY AREAS ATTAIN TARGETS

OW062042 Beijing XINHUA in English 1109 GMT 6 May 86

[Text] Beijing, 6 May (XINHUA)--People living in China's minority nationality areas have fulfilled all the targets set in the Sixth 5-Year Plan (1981-85), an official of China's Nationalities Affairs Commission announced here today.

In the past 5 years, he added, the economies of these regions have been developing steadily.

In 1985, total industrial and agricultural output value of these areas reached 79 billion yuan--14.6 percent more than in the previous year or 58.6 percent more than in 1980.

During the Sixth 5-Year Plan period, the average annual increase of the industrial and agricultural output value of the areas was 9.7 percent, as against 6.6 percent in the preceding 28 years.

The agricultural output value of the autonomous areas last year was 35.1 billion yuan, an increase of 8.1 percent over 1984 or 45.2 percent more than in 1980. The average annual growth rate was 7.7 percent in 1981-85 as against 3.5 percent in the previous 28 years.

In 1985, the number of industrial enterprises in these areas had grown to 40,000, with their output value (including that of village-run industries) totalling 43.9 billion yuan--20 percent more than in 1984.

At the same time, the living standards of peasants and herdsmen living in these areas improved steadily, and the average increase rate of their actual [word indistinct] of urban residents was anywhere between 5 percent and 8 percent.

China has a total of 55 minority nationalities, totalling some 67 million people, or about 6.7 percent of the country's population. Minority nationality atonomous areas account for 60 percent of the country's total land.

Last year, the total industrial and agricultural output value of the five autonomous regions of Inner Mongolia, Xinjiang, Guangxi, Ningxia and Tibet was 54.2 billion yuan, and industrial output value, 32.8 billion--9.2 percent and 19.3 percent more than the previous year respectively.

Of the five autonomous regions, the Xinjiang Uygur and Ningxia Hui Autonomous Regions fulfilled their main targets set in the Sixth 5-Year Plan, 1 year ahead of schedule, and the industrial and agricultural output value of Xinjiang ranked 14th for several years running among the 29 provinces, municipalities and autonomous regions on the Chinese mainland.

BRIEFS

LIAONING ECONOMIC ACHIEVEMENTS--Under the leadership of the party and government, the people of all nationalities in Liaoning Province vigorously implemented the principle of invigorating the domestic economy and opening to the outside world, persisted in putting reforms in the first place, defeated rare natural disaster at one blow, and enabled the national economy of Liaoning province to witness an excellent situation of sustained, stable, healthy, and balanced growth. The provincial statistics bureau released on 9 February a bulletin on Liaoning's national economic and social development in 1985. It revealed the following figures: In 1985, Liaoning's gross value of social products came to 102.45 billion yuan, an increase of 13.6 percent over 1984; its gross value of industrial and agricultural output amounted to 80.03 billion yuan an increase of 13.4 percent; its national income was 40.09 billion yuan, an increase of 9.9 percent; its total agricultural output value was 14.06 billion yuan, an increase of 9.9 percent; and its total industrial output value was 65.72 billion yuan, an increase of 14 percent. Of the fixed-asset investment of state-owned units, capital construction investment accounted for 5.61 billion yuan, an increase of 44.7 percent over 1984. The annual local revenue came to 7.93 billion yuan, an increase of 1.05 billion yuan or 17 percent over 1984. [Text] [Shenyang LIAONING RIBAO in Chinese 9 Feb 86 p 1] 12302

ECONOMIC MANAGEMENT

XUE MUQIAO DISCUSSES COMMODITY EXCHANGE

Beijing WUZI GUANLI [MATERIAL MANAGEMENT] in Chinese No 1, 20 Jan 86 pp 5-7

[Article by Xue Muqiao [5641 2550 2890], as part of his new book, "Zhongguo Wuzi Maoyi Zhongxin" [China's Material Trade Centers"] to be published by the China Materials Publishing Company: "Promote Commodity Exchange, Expand the Role of the Market"]

[Text] China's socialist economy is a planned commodity economy that centers around the system of public ownership of the means of production. Since it is a commodity economy, commodity exchange must be conducted on the market. Old China was a country in which the commodity economy was not fully developed, and market exchange was in an early stage of development. Our creation, after the establishment of New China, of the planned management system limited instead of promoted commodity exchange and reduced instead of expanded the scope of the market. For a long time we believed that the means of production were not commodities, and therefore replaced commodity production were not commodities, and therefore replaced commodity exchange with planned allocations. There was no market for the exchange of capital goods. For an important portion of consumer goods, state requisitions, centralized purchasing and planned distribution took the place of a capital goods market. This was in violation of the objective laws of economic development and stifled the entire national economy.

After the 3d Plenum of the 11th CPC Central Committee in 1978 we admitted that both capital and consumer goods were commodities, and that it was necessary to develop a market for commodity exchange. We eliminated part of the planned management system that had been restricting the commodity market, reformed the system of commerce, replaced monopolized administration with diversified management, reduced the scope of planned distribution and expanded market exchange, stimulating the economy as a result. The 3d Plenum of the 12th Central Committee declared even more clearly that China's socialist economy was a planned commodity economy, and that it would be necessary to further promote commodity exchange and expand the role of the market. Capital goods were to be exchanged on the market using negotiated prices outside of that portion to be allocated according to the plan. The centralized requisition and purchase of agricultural products and planned distribution (limited distribution) of agricultural products were to be gradually eliminated and restrictions on the market and prices were to be ended in order to implement a system of market regulation under the leadership and with the participation of state-run commerce. The bureaucratic distribution system of daily necessities involving three levels of wholesale stations was replaced by a diversified system involving the state, collective and individual in which state-run commercial sectors conducted purchasing and sales on commission and the factories sold their own products. The market became even more prosperous than before.

However, due to many years of favoring industry at the expense of commerce, the exchange of industrial and agricultural products between city and countryside and between regions is not sufficiently lively. Unsold products pile up frequently in one location while going out of stock in another. Despite the fact that many peasants and herdsmen in regions in the southwest and southeast where there are surpluses of cotton and cotton cloth lack cotton clothing and quilts, problems involved in the purchase and sale of quite a few products are far from being resolved. The development of the commodity production and the expansion of market exchange are issues that urgently need to be addressed in order to develop industrial and agricultural production and improve the people's living standards.

There are still quite a few difficulties involved in the exchange of capital goods. Although negotiated purchases and sales of capital goods are permitted, markets for the exchange of capital goods are not yet widespread and buyers are sent in all directions, while speculative activities involving making huge profit by illegal resale are developing rapidly. There have been newspaper accounts of steel products, still in the same storage facility, being sold and resold 4 or 5 times, drastically driving up prices. Despite steel shortages in recent years that have necessitated the annual import of more than 10 million tons, steel warehouse inventory has not only not been reduced, but is constantly increasing. Many units are competing to purchase steel products not to use in production or construction, but to resell for huge profits. A good way to resolve this problem would be the creation of capital goods exchange markets (they could also be called trading centers), to facilitate direct contacts between the producer and the consumer. When it is easy to purchase raw materials, hoarding by all levels of materials departments and enterprises would not be necessary, which would greatly alleviate shortages of these materials and lower negotiated purchasing and sales prices. Since we recognize that the means of production are commodities, we should create a network of markets for their exchange. Without such a market, it will be impossible to smoothly engage in commodity exchange with low circulation costs. A Japanese friend told me that annual steel output in Japan is around 100 million tons, of which 5 million tons is normally in storage, or the equivalent of approximately 5 percent. In China 40 to 50 percent of all steel inventory output is inventory. All raw materials can be freely purchased at any time in Japan, so most factories do not have more than 1 month's inventory at any one time. Due to the difficulty of obtaining materials in China, we often begin to feel nervous with inventories that could last 5 to 6 months. Therefore, the creation of a market for the exchange of capital goods would be an important method in alleviating shortages of raw materials (especially steel).

Of course, the fundamental reason for shortages in the supply of the means of production is the excessively large scope of capital construction. Therefore the main way to alleviate shortages is to shrink the scope of capital construction and restore the balance between overall supply and demand of the means of production. The scope of capital construction in China from 1978 to 1980 was too large. Every year nearly 10 million tons of steel were imported, while steel inventories mounted. With the reduction of the scope of capital construction in 1981, less steel was imported and inventories took a marked dip. Clearly the overly large scope of capital construction was the basic cause of the steel shortage. Plus, without a market for the exchange of steel, the piling up of steel products in warehouse intensified the shortage. In 1980 I visited a capital goods market in Shanghai consisting of only a few dilapidated buildings. Many factories had brought detailed inventory lists of their materials piling up in storage to the market to engage in exchange. In this way, needs for some materials that could not be satisfied by applying to the materials bureau were met. At the time I suggested building the dilapidated sheds into a large building, allowing each large factory to rent a room to engage in exchange at the market. Factories that could not lease a room could also be allowed to trade there. The Bureau of Goods and Materials could participate on market trade and win a dominant place for itself taking advantage of its vast forces. A minority of regions are now constructing markets, but they are far from satisfying the needs of capital goods exchange. Some places are currently experimenting with allowing materials sectors to conduct centralized management over negotiated purchasing and selling without allowing direct contact between seller and buyer. This is still the old method of replacing market exchange with distribution and allocation, and it will probably not bring about a fundamental resolution of the problem.

The exchange of consumer goods is a bit better than that of capital goods, but the capacity of the consumer goods market is insufficient to meet the needs of urban and rural residents. As the few department stores in large cities are unbearably crowded, small shops should be built for the convenience of the residents. Middle- and small-sized cities must create vast commercial networks, and increase commodity supply to avoid the problem of everyone crowding into the large cities. Rural market towns had once been centers for commodity exchange between city and countryside. But due to the monopolistic business practices of the Ministry of Commerce and the supply and marketing cooperatives from the 1950's to the 1970's, small private shops were eliminated, but it was impossible to build so many state- and collective-run shops to replace them. As a result, shops in many market towns that had thrived before liberation were turned into residences, while business slowed to a standstill and the residents had to go into the city to purchase commodities they needed. Even though commodity production has increased nearly 100-fold in 30-odd years, there are fewer shops and stores than before. Even in big cities, many smaller shops were turned into residences, which led to bad overcrowding in a few large department stores. Commodity exchange must be expanded at the same time that commodity production is increased. At present there is too much of an imbalance between the two. Of course, not only is commerce unsuited to the needs of commodity production, but so are communications and transportation as well. The CPC Central Committee's call to develop tertiary industry is a strategic principle.

Due to the inability of state-run and collective commerce to satisfy needs, there has been swift development in recent years of individual commerce and peddling. Although this is necesssary, independent peddlars cannot be used to substitute for state- and collective-run shops. State-run commerce (the largest portion of which is locally administered at the city level), should maintain its dominant position on the market. Collective commerce plays a strong role in supporting state-run commerce (and probably holds a dominant position in the countryside), and the self-employed, individual merchant is a necessary complement to it. In capitalist countries, large- and middle-sized stores also dominate the market, leaving a supplementary role for the smaller, individual merchant. In socialist countries socialist state-run and collective stores should occupy an even more dominant position. Small, independent merchants play an important role in stimulating the market and should not be squeezed out, but they are, after all, more difficult to supervise than state-run and collective shops. There are also more instances of deception and more problems involved in managing prices and taxes. Of course, compared to industry, commerce should be a bit more decentralized. It is our guiding principle to develop the state-run, collective and individual simultaneously and allow them to compete. State-run commerce could predominate in the trade of the most important commodities and products in large quantities, while lesser commodities and most of the retail trade could be undertaken by the collective or individual sectors.

After the great development of the commodity market, and in particular the implementation of the policy of developing state-run, collective and individual sectors together, market management must be strengthened. After the establishment of New China, market management was in fairly good shape due to the widespread existence of private industry and commerce. At the time, the Industrial and Commercial Management Bureau had a good deal of authority over market management. After the completion of the transition to socialism, in particular after the beginning of monopolistic practices by the commercial sectors, the management work of the bureau was replaced by the administrative management of the Ministry of Commerce, Bureau of Goods and Materials and the Marketing and Supply Cooperative, greatly reducing the bureau's power. With the overall economic reform and the diversification of commerce, we should expand the bureau's power to manage the market. Strict market management must be exercised over small independent merchants, and the state-run and collective commerce must be supervised as well. While there is cheating in independent commerce (although most private merchants are honest), deception in state-run and collective commerce has not been entirely eliminated either. For example, many cases involving the sale of phony medicine and liquor and other practices harmful to the consumer have occurred in state-run factories and stores. As they are enterprises run by local authorities, local Industrial and Commercial Management Bureaus have a hard time dealing with them. From now on, we should strengthen economic law and improve the legal system so that the bureau and other management organs have the power to intervene in any case involving violation of the law. If an enterprise resists supervision, an appeal can be made to a higher authority. If the higher authority protects the enterprise's illegal activities, an appeal should be made to the courts. Consumers' associations have been set up in many places to assist market management organs in improving their work. If market management organs engage in favoritism and irregularities, the consumers' associations should report and expose such behavior to the relevant higher authorities or seek to curb them via mobilizing public opinion through the media.

YINCHUAN, NINGXIA COMMERCIAL OUTLETS MULTIPLY IN 1985

Yinchuan NINGXIA RIBAO in Chinese 10 Dec 85 p 1

[Article by Cao Shuchun [2580 2885 2504], Jia Wenyong [6328 2429 3057] and Jiang Lin [5592 7792]: "Results of Ningxia's Construction of Commercial Network Outlets in the Sixth 5-Year Plan Gratifying; The Masses' Difficulties in Buying, Eating, Housing, and Repair Achieve Preliminary Resolution; 12.5 Commercial Network Outlets for Every 1,000 People in the Yinchuan Urban District, Entering the Front Ranks Nationally"]

[Text] Development of Ningxia's commercial outlet network has made gratifying progress during the Sixth 5-Year Plan. The number of people served by each network outlet dropped from 639 in the Fifth 5-Year Plan to a current 124.

New Developments in state-run commercial outlets: state-run commercial outlets may reach 3,600 by the end of 1985, an increase of 46 percent over the Fifth 5-Year Plan, and an average annual increase of 9.2 percent. In addition to local financial allocations, relevant central government departments have also invested in these newly added network outlets. There has been an increase in minority nationality development funds used in developing the commercial outlet network, with a special investment of 6 million yuan between 1983-1985 to be used in outlet construction in the minority nationality prefectures of Xiji, Haiyuan, and Guyuan, and the counties and cites belonging to Yinnan Prefecture. In strengthening the function of state-run commercial enterprises as principal conduits, these newly added outlets are performing an important role in market regulation.

The swift development of collective and individual commercial network outlets: by the end of November 1985, collective commercial enterprises of all types may reach 2,800, a 42-percent increase over the period of the Fifth 5-Year Plan, and an average yearly increase of 8.4 percent. Individual commercial enterprises, beverage services, and repair enterprises grew even more quickly, with an 11.68-fold increase over the Fifth 5-Year Plan period. These collective and individual commercial outlets are either set up jointly by different units and the community youth they organize or self-run by idle community members and community youth who have raised capital on their own. Management is lively and service thorough. In isolated mountain districts and in some farm villages where transportation is difficult, a group of people have appeared who travel around a string of villages in the countryside and shoulder their loads of goods to the door. Farmers can buy daily necessities without leaving the village. Market, collective, and individual peddler spots spread out row upon row in the various areas of the great expanse of farm villages on market days. Trade is brisk, presenting a series of prosperous images.

Notable successes of Yinchuan City Commerce Bureau in employing a variety of forms to raise capital for development of outlets: commercial departments in various places have been actively restoring, rebuilding, and expanding some old networks during the Sixth 5-Year Plan; many methods have also been adopted to concentrate community funds for developing commercial network outlets. Yinchuan City is the most noteworthy. From 1984 to 1985, 20 commercial outlets have been opened or are under construction in the Yinchuan City commercial system. There is 1 square meter for every two urban residents. In the construction of these network outlets, privately-raised and community-collected capital accounts for 67 percent of the total investment. By the end of this November there were more than 3,540 state-run, collective, and individual commercial outlets in Yinchuan City (excluding Helan and Yongning counties and their suburbs), an average of up to 12.5 commercial network outlets for every 1,000 people, entering the front ranks nationally.

Coordinated fund-raising utilizing different channels and forms by the state, collectives, and individuals will forcefully accelerate commercial outlet development. Ningxia's outlets might number 33,400 by the end of November, 1985, a 4.4-fold increase over the Fifth 5-Year Plan. The number of people served by each outlet dropped from 639 in the Fifth 5-Year Plan to the current 124. There are 8.05 network outlets per 1,000 persons, in the upper-middle ranks nationally. The masses report that products are abundant, peddler shops many, purchasing easier, and the market much more prosperous than in the past. Ningxia's long-term shortage of commercial outlets has already changed, while purchasing, eating, housing, repairs, and other difficulties have begun to be resolved.

CITIC CHAIRMAN URGES IMPROVED ECONOMIC RESULTS

OW091946 Beijing XINHUA in English 1759 GMT 9 May 86

[Text] Beijing, 9 May (XINHUA)--China's enterprises urged today to strengthen their management and improve economic results to make greater contributions to the country.

Rong Yiren, chairman of the China International Trust and Investment Corporation (CITIC), was addressing a financial planning meeting on CITIC-backed joint-venture enterprises. He stressed the importance of enterprises using foreign capital improving their economic performances.

Up to the end of last year, CITIC had helped set up 140 joint ventures, of which 39 were Sino-foreign ventures and 101 were backed by CITIC with foreign capital. These enterprises are involved in textiles, light industries, food, chemicals, mining, metallurgy, electrical equipment, transport, communications, electronics and commerce, and are scattered in more than 20 provinces and cities as well as many foreign countries, including Australia, France, Kuwait, New Zealand, Spain and the United States, and Hong Kong and Macao.

Of these enterprises CITIC has helped to launch, 66 have gone into operation, and by the end of last year had made total profits of 13,800,000 yuan.

The four-day financial planning meeting, which ended today, was attended by representatives from more than 100 enterprises in 24 provinces and cities, and officials from the State Planning Commission, Finance Ministry, Foreign Economic Relations and Trade Ministry and the People's Bank of China.

NEW CHANGES IN PRODUCTION STRUCTURE OUTLINED

Hong Kong LIAOWANG OVERSEAS EDITION in Chinese No 14, 7 Apr 86 pp 17-18

[Article by Yue Bing [1471 0393]: "New Changes in China's Production Structure"]

[Text] During the Seventh 5-Year Plan period, China will make a series of major changes. An eye-catching one will be the change in production structure.

Three Major Changes in Agricultural Economy

Further readjusting rural production structure and gradually realizing the specialization, commercialization, and modernization of agricultural economy is one of the primary targets of the "Seventh 5-Year Plan." During the "Sixth 5-Year Plan" period, China successfully readjusted rural production structure. The grain acreage was reduced by over 130 million mu but the total value of agricultural output increased 233 billion yuan or more than 1-fold. The main reason is that as a result of the reform, the labor productivity of the farming industry has increased, a large amount of labor has begun to transfer from farming to non-agricultural production and township and town enterprises have developed greatly. Comparing the total social output value of 1985 with that of 1949, the ratio of industry is up from 25.2 percent to 53.9 percent and that of agriculture is down from 58.5 percent to 27.8 percent, indicating that China has begun to advance toward an industrial society.

Judged from production structure, China's industrial ratio is already close to two thirds of total social output value but agricultural population, which indicates whether a country has finally realized modernization, is still too high not to be alarmed. By the end of 1984, the number of laborers directly engaged in agricultural production in China remained as high as 320 million, accounting for 68.4 percent of total laborers. If China fails to change this situation fundamentally or if it fails to transfer successfully over a half of existing rural labor to other industries, its four modernizations drive will confront great difficulties.

During the "Seventh 5-Year Plan" period, while doing a good job in grain production, China will "actively support township and town enterprises, draw up rational planning for them, give them correct guidance and strengthen their management." In addition, China will emphatically develop the farm product processing industry and develop before- and after-production services such as the storage, packaging, transport, supply, and marketing of farm products. Where conditions permit, China should, according to actual needs and local conditions, vigorously develop subsidiary industries to supplement major industries and develop export-oriented processing industries. By developing such industries, China should realize the transfer of agricultural labor to non-agricultural labor in rural areas. This is a good way of changing production structure with little investment, quick results, good efficiency, and little shock.

The Rise of New Industries

In October 1983, in view of the "third wave" and the "new technological revolution," which were widely discussed in the developed Western countries, Premier Zhao Ziyang suggested that we pay attention to studying the trend of the new world technological revolution and China's countermeasures. In the past few years, Chinese experts have conducted arduous, painstaking, thorough, and extensive studies around this issue and turned out many valuable research reports and countermeasures. They contend that in order to realize as soon as possible the modernization of production structure in China, equal attention should be paid to the development of traditional and new industries and priority should be given to the technological transformation of traditional industries while doing a good job in the establishment and development of new industries. Because of this, the electronics industry should be considered the leading industry and pillar and back-bone industries such as agriculture, machine-building, and building industries as the second echelon in industrial development. The third echelon consists of basic and weak industries in China's economic development including three major basic industries--energy, transport and communications, and materials--and the tertiary industry such as commodity circulation and service trade. This should be considered the basic framework for the transformation of China's production structure.

Along this train of thought, during the "Seventh 5-Year Plan" period, China should focus on developing microelectronic and information technologies and new materials while strengthening the research and development of such new technologies as biological engineering, space, nuclear, laser, and marine industry, fully developing the functions of old bases and gradually establishing several new industries.

In the meantime, the state will increase investment in major construction prjects in the fields of energy and raw materials and increase their ratios in state investment. In the energy industry, efforts should be focused on the development of electric power to strive to bring national power output to 550 billion kwh by 1990, an increase of 35 percent over 1985. In the raw materials industry, great efforts should be made to develop the iron and steel industry, which already is "a sunset industry" in some developed countries. However, proceeding from China's national conditions, the iron and steel industry needs to be further developed. It needs to increase not only output but also the variety of products, improve the quality of products, and increase the ratio of high performance steel products such as alloy steel and low alloy steel in the total output of steel.

Accelerate the Development of the Tertiary Industry

The rise and growth of the tertiary industry is an inevitable trend resulting from the further development of social division of labor and the continuous improvement of labor productivity. It is also an important characteristic of modern economy. For a long period of time, China's tertiary industry has been very backward. By 1984, the output value of the tertiary industry accounted for only 22.1 percent of the total value of domestic output and the number of employees in the tertiary industry accounted for only 14.4 percent of the total number employed. This level is much lower than that of economically developed countries. It is even lower than that of many developing countries. The seriously backward tertiary industry, clogged transport channels, lack of information, and underdeveloped commercial, financial and technological consulting services have created many inconveniences in production and daily life. This is also an important reason for China's poor results in the use of capital and low efficiency in production. Because of this, during and beyond the "Seventh 5-Year Plan" period, the tertiary industry, especially transportation, communications, commercial, and catering services, should be considered the focus of vigorous development. This is an important strategic measure for forming a new production structure and an economic development pattern.

The domestic consumption pattern has changed drastically, setting forth new demands on production. Between 1978 and 1984, the per-capita net income of peasants in China increased 1.6-fold and the average per-capita wage of workers increased nearly 1-fold. Due to the substantial rise in the income level, the trend of the people's consumption has begun to change and consumption has begun to transfer from a stage dominated by necessities to a stage dominated by non-essentials. Plain print and old "three pieces" (wrist watch, bicycle, and sewing machine), which were hot-selling products for several decades, have begun to change from hot-selling to slow-selling products whereas the supply of the new "five pieces" (television set, cassette recorder, washing machine, refrigerator, and camera) falls short of demand. High-grade furniture, fine wool fabrics, high-class carpets, motorcycles, and even small automobiles have also begun to enter the homes of ordinary workers, peasants, and intellectuals. In only a few years, a tendency to switch from low to high class and from quantity to quality has emerged in the structure of demand.

Therefore, from now on, the food, clothing, and durable goods industries will be the focus of the consumer goods industry. They will make great efforts to increase the production of popular-brand, high-quality, and high-grade new products and upgrade and update China's consumer goods industry as soon as possible.

Structural Switch About To Appear

To realize the four modernizations in an all-round way, first of all, production structure must be modernized. Over the past 30 years, China's economic appearance has changed drastically, laying a solid foundation for the qualitative leap of production structure. The general idea of the "Seventh 5-Year Plan" has charted a correct orientation for this leap.

The new China has long relied simply on planning for the arrangement of the production structure of the whole society, resulting in a loss of control and poor management. Some industries or trades which should have been eliminated or shrunken a long time ago cannot be eliminated due to administrative support whereas some industries which should have been developed cannot be developed because no arrangement has been made in the plan or because economic parameters have been seriously distorted, resulting in the present irregular and irrational production structure. It would be very difficult to form a new rational production structure if we continue to follow this old path.

Therefore, on the basis of developing the mechanism of planning and the superiority of unified plans and guidances, we should bring in the market mechanism by means of reform and enable the production structure gradually to become rational by means of competition. This is the most effective mechanism for realizing the transfer of production structure. To do so, first of all, we should conduct thorough research, draw upon the successful experiences of developed and developing countries, and, in light of China's actual conditions, formulate scientific and feasible production goals and models to be used as the basis for the guidance of state policies. Second, state economic management departments, especially the planning commission, may, according to existing production policies and plans and through coordinating various economic parameters such as taxes, subsidies, and interest rates, change the market environment to protect the existence and development of some industries and trades and suppress the development of others to attain the goal of readjustment. Third, we should establish rules for the market mechanism and competition and enable all industries, trades, and enterprises to compete under the same conditions. They should decide on their own strategies and determine whether they can survive in accordance with the changes in social demand and the situation of market conditions. The key here is that there must be a rational pricing mechanism which can genuinely reflect the changes in social demand. A flexible rational pricing mechanism will lead to the rational flow of natural resources and enable production structure to become rationalized instead of causing the present "inverse effects." However, in order to do the above three things, we should further carry out reforms and, through reforms, open up a new road for readjusting production structure.

BRIEFS

RESEARCHERS HELP YUNNAN FACTORIES--Kunming, 8 April (XINHUA)--Factories in Yunnan Province which lack technicians can now get help from researchers in schools of higher learning, provincial officials here have said. Staff members of universities, colleges and research institutes, who are eager to test their ideas in practice, have participated in 94 projects to boost production, and this in turn has contributed to their ongoing research. In one such project, researchers saved a light machinery plant plagued by outdated, unsellable products in a rural area 200 kilometers west of Kunming, the provincial capital. Working with factory workers, they developed a noodle-making machine that sold well on China's mainland and in Hong Kong, restoring prosperity to the enterprise. [Text] [Beijing XINHUA in English 0005 GMT 8 May 86 OW] /12858

NEW MANAGEMENT HELPS PORT--Shanghai, 9 May (XINHUA)--New self-management authority has enabled the port of Shanghai, China's largest, to begin to expand and upgrade its facilities in line with the country's economic development. All Chinese ports are managed by the central government's Ministry of Communications. But, according to Zhao Weichen, deputy chief of the Port Management Group of the State Council, China's highest governing body, there has been a significant transfer of power to local port authorities. The transfer, which eliminates the need for central government approval of expansion plans, was a "big decision for the central government and an important measure in restructuring China's communications system," Zhao was quoted as saying in today's ECONOMIC DAILY. The expansion plan made possible by the transfer of power "will boost the port's handling capacity and its economic efficiency," alleviating bottleneck problems caused by poor facilities and lack of an adequate number of berths, according to Zhao. The Shanghai port handles one-third of the country's cargo, he said. [Text] [Beijing XINHUA in English 1425 GMT 9 May 86 OW] /12858

TRANSREGIONAL FOREIGN EXCHANGE REGULATION EXPANDED

Hong Kong WEN WEI PO in Chinese 9 Apr 86 p 12

[Article: "Trans-regional Foreign Exchange Regulation Operations To Be Restored and Expanded This Year by the Bank of China--Admission of Chinese and Foreign Joint Ventures Still Being Studied"]

[Text] Wu Nianlu [0702 1819 7627], acting director of the International Monetary Research Institute of the headquarters of the Bank of China, revealed on 8 April that the Bank of China will restore in 1986 its trans-regional foreign exchange regulation operations and substantially increase the former rate of exchange in internal regulation. Currently, the internal exchange rate of Renminbi to the dollar is already 10 percent higher than the official rate.

Wu Nianlu revealed this information during an interview with the staff reporters of WEN WEI PO at the "Forum on China's Foreign Trade and Investment" which was held in Hong Kong on 8 April. He said the national foreign exchange regulation operation currently is applicable only to domestic enterprises and units and limited only to the part of foreign exchange retained by these units for their own use; therefore, the market will not be very broad. As for the question of whether Chinese and foreign joint ventures are allowed to take part in the regulation, studies are still being carried out and no final decision has been made yet. This is because foreign exchange can be regulated between two joint ventures according to rules.

Wu Nianlu said: As an internal operation of the Bank of China, foreign exchange regulation has been carried out for several years. However, due to various reasons, such as buyers outnumbering sellers and demand surpassing supply, this operation was suspended in 1986. Therefore, it is believed that restoring the operation and substantially increasing the exchange rate will better develop the function of regulation. As for how big the increase will be in the exchange rate, it is not appropriate to disclose it at the moment.

While talking about the issue concerning the Bank of China accepting irrevocable letters of credit issed by itself, Wu Nianlu said: At the end of 1985, the headquarters of the Bank of China held a national forum of all branch offices on the settlement of international accounts. The forum reiterated that no matter what happens, the Bank of China should and is fully obligated to accept and pay for all irrevocable letters of credit it issued if documents correspond to each other. No matter what happens to import companies and whether or not they are willing to pay, as the Bank of China, it must honor the contracts it signed for the letters of credit.

China decided at the end of 1985 to plan for the construction of monetary centers in Chongqing, Wuhan, Guangzhou, Changzhou, and Shenyang. Wu Nianlu said: These five cities are actually pilot cities for the national reform of the monetary system, which will be concentrated on the following two questions: 1) How to establish a socialist capital market, improve credit instruments, and develop the horizontal links of capital and 2) how to run specialized banks like an enterprise. We hope that through this year's trial reform we will gradually create conditions, explore new roads, and lay a solid foundation for the all-round reform to be carried out in 1987 and 1988.

CHINA'S STATE BUDGET MANAGEMENT SYSTEM

Beijing CAIZHENG [FINANCE] in Chinese No 3, 8 Mar 86 pp 40-41

[Article by Hu Luoting [5170 2867 0080]: "China's State Budget Management System"]

[Text] I. Principle for the Establishment of the State Budgetary Management System

The state budgetary management system is a basic system for dealing properly with the relationship of budgetary distribution between the central and local governments and among the localities at different levels and for determining the scope of budgetary incomes and expenditures and management responsibilities at various levels. An important component of the financial management system, it occupies a dominant position in the system.

The basic principle behind the establishment of the state budgetary management system is "centralized leadership and decentralized management." It is derived from the principle of democratic centralism adopted by the party and the state budgetary management system. It is a principle determined by the political and economic system of the nation.

The purpose of implementing the principle of "centralized leadership and decentralized management" in the establishment of the state budgetary management system is to ensure that the major part of the financial power of the state should be centralized in the central government as dictated by the state budgetary management system and to make available to the state the necessary funds for key constructions while maintaining a certain degree of stability in the localities, so that their financial mobility may be enhanced year by year and that they may be in a position to promote their economic development. Taking the interests of the whole into account, this principle, while safeguarding the overall interests of the nation, also enables the state to delegate certain financial powers to the lower levels, so that they may have some freedom of action to meet the needs of local conditions. While enabling the concerned departments to exercise their initiative to the full, this principle also serves to motivate the enthusiasm of the localities.

II. Basic Contents of the State Budgetary Management System

1. Establishing the State Budgetary Management System

Establishing our state budgetary management system is closely linked to our political structure and the division of our administrative areas. All areas above the county level with first-class political powers are vested with first-class independent budgetary powers. The administrative management system of the nation is divided into two major categories, namely, the central and local systems. Likewise, the state budget is made up of the budgets of the central and local governments. The budget of the central government is made up of the budgets of the various units of the various departments of the central government and the budgetary estimates of the financial receipts and expenditures of the enterprises under the various departments of the central government. The budgets of the local governments are made up of the budgetary estimates of the provinces, autonomous regions, municipalities directly under the central government and cities and counties under the municipalities. The total budget of the localities at various levels is made up of the budgets of the localities at the lower levels and the budgets and financial income and expenditure estimates of the various units at the same level. The budgets for the people's governments at the rural and township levels are in the process of being established.

2. The Division of Responsibility in the State Budgetary Management System

In accordance with the principle of centralized leadership and decentralized management, the proper demarcation of the limits of authority and responsibility for budgetary management at various levels is essential for establishing a relationship between the interests of the whole and those of the parts and between the centralization and decentralization of power. Generally speaking, authority over the state budget should mainly be vested in the central government. In exercising centralized leadership, the central government assumes the responsibility for the formulation of financial guiding principles and policies, planning and rectification of the state budget and setting up major budgetary rules and regulations. Authority exercised by the localities includes the drawing up of overall budgetary plans for the localities, the flexible allocation and utilization of the financial resources of the localities, the drawing up of specific measures for the implementation of the unified policies, decrees, and systems of the central government and the enforcement of the detailed rules and regulations.

The state is responsible for achieving a balance of payments in the budget, regulating budgetary funds among the various areas, and providing assistance to the economically undeveloped regions in general and areas inhabited by the minority nationalities in particular. The localities at various levels are responsible for achieving a balance of payments at their own levels.

3. The Allocation of State Budgetary Incomes and Expenditures

According to the state budgetary management system, the degree of authority over budgetary management and the scope of operations at various levels are largely reflected in the allocation of budgetary incomes and expenditures.

Generally speaking, incomes and expenditures should be allocated according to the following principles: First, they should be allocated under unified planning with consideration being given to all the factors. In other words, we should proceed from the standpoint of the whole nation, make plans on an overall basis, ensure the success of the key projects and give due consideration to all the factors. Second, financial power and the power to act must be coordinated. That is to say, in the allocation of incomes and expenditures, we must ensure that the administrative units at various levels should have the financial power to perform their functions. Third, we must ensure that expenditures are in keeping with incomes and that the degree of authority given to the administrative units at various levels is in proportion to their responsibilities. In other words, we must, in the allocation of incomes and expenditures, establish a relationship between budgetary incomes and expenditures of the localities and a coordinated relationship among responsibility, authority, and benefits.

4. Flexible Financial Resources of the Localities

By flexible budgetary financial resources of the localities is meant that part of the funds allocated to and made use of the localities themselves. They represent a supplementary measure for reconciling the limits of authority exercised by the state budgetary management system and the division of incomes and expenditures between the central government and the localities. Part of the flexible budgetary resources of the localities is derived from the reserve funds set up by the budget and part from increased incomes and surpluses resulting from reduced expenditures. As stipulated by the budgetary management system, the central government, as from 1976, is to make available to the localities a certain amount of resources while allocations for local budgetary expenditures are being made, so that such resources may be used by the localities to develop local economic, cultural, and welfare operations.

III. Evolution of the State Budgetary Management System

Since the establishment of the republic over 30 years ago, our state budgetary management system has undergone a number of changes. The main trend is the evolution from the highly centralized management system adopted in the early years of the republic to the delegation of management authority to the localities at different levels under the unified leadership of the central government in the allocation of financial resources of the central government and the localities in keeping with the developments in the political and economic situation.

In the early years of the republic, the highly centralized and unified budgetary management system calling for unified incomes and expenditures was adopted to meet the need for the unified financial and economic management of the entire nation. All incomes and expenditures and all income and expenditure measures and standards were set in a unified manner by the central government; all financial receipts and expenditures were required to be incorporated into the state budget and most of the financial authority exercised by the state was vested in the central government. In 1951, when the financial and economic situation in the nation took a turn for the better, some authority in financial management was delegated to the lower levels and financial management was shared by the central government, the larger regions, and the provinces (municipalities under the central government). In 1953, when China embarked on its First 5-Year Plan in the development of the national economy, the localities were given a larger measure of authority over the management of their budgets with the adoption of the new three-level system of management shared by the central government, the provinces (autonomous regions and municipalities under the central government) and the counties (cities). The adoption of the new system has enabled the counties to bring their initiative into play in the financial management of the state budget.

Measures for the "classification and allocation of incomes" were adopted during the First 5-Year Plan. Budgetary incomes of the central government and the localities were divided into three categories, namely, fixed incomes, incomes allocated according to a fixed ratio, and readjusted allocated incomes. The allocation of expenditures was basically determined by the jurisdiction of the enterprises, businesses, and administrative units. The expenditures of the units were incorporated into the budgets of the departments to which they belonged. Expenditures for the reclamation of wastelands were disbursed by the central government to the localities as special allocations.

Between 1959 and 1970, the measure calling essentially for "division of the total amount, with revisions being made on an annual basis" was enforced. After the total incomes and expenditures of the localities had been approved by the central government, the ratio for the amounts going to the central and local governments was set and revised on an annual basis. This measure was adopted to meet the needs of the situation marked by considerable political and economic changes at the time.

At the start of the Fourth 5-Year Plan in 1971, the state put most of the enterprises and business units under the management of the localities. At the same time, the "income and expenditure contract" measure was adopted by the budgetary management system. According to this measure, the total amount of budgetary incomes and expenditures of the localities was set by the central government. Incomes over and above the amount of expenditures were paid into the budget of the central government according to the contract, while expenditures in excess of incomes were subsidized by the central government. At the end of the year, the surplus in budgetary incomes over expenditures was retained by the localities. The localities were made responsible for achieving a balance of payments. In 1974, the nationwide measure providing for the retention of budgetary incomes according to a fixed ratio, the setting of a ratio for the division of income surpluses, and the disbursement of expenditures according to the contract quota was adopted on a trial basis. While ensuring the localities a stable amount of flexible financial resources, this measure, due to the discrepancy between incomes and expenditures, failed to motivate the positive attitude of the localities to increase their incomes and reduce their expenditures to achieve a balance of payments and to implement the principle of establishing a proper relationship between the exercise of authority and the fulfillment of responsibilities. For this reason, the measure for the "division of the total amount with adjustments to be made on an annual basis" was readopted in 1976. In 1978, the measure for the "division of increased incomes and the establishment of a relationship between incomes and expenditures" was adopted on a trial basis in certain provinces and cities. The ratio for the division of added incomes was set by the central and local governments through consultation.

With a view to implementing the policy of the central government to readjust the national economy and to bring about a gradual reform of the economic system, corresponding reforms were made in 1980 in the state budgetary management system, and the measure for the "division of incomes and expenditures and the adoption of the contract system at different levels" to remain unchanged for 5 years was adopted by most of the provinces on a trial basis. At the same time, in order to cope with the actual circumstances in various areas, the measure for contracting the units for the completion of large-scale budgetary tasks and for the "division of incomes and expenditures and the payment of fixed amounts to the state (or payment of fixed subsidies by the state)" was adopted by the provinces of Guangdong and Fujian; the budgetary management system for the nationalities localities for "setting the limits in the division of incomes and expenditures, the amounts of subsidies and the amounts to be retained by the localities on a preferential basis" was adopted for the eight regions of Nei Monggol, Xinjiang, Xizang, Ningxia, Guangxi, Yunnan, Qinghai and Guizhou; the measure for "the assumption of responsibilities according to fixed contract terms" was adopted by Jiangsu on a trial basis. This budgetary system based on the principle of "cooking meals on different stoves" has served to enlarge the financial powers of the localities, to further strengthen the positive attitude of the localities in the management of their own affairs and financial matters and to facilitate the reform of the economic system.

IV. The Present State Budgetary Management System

Since 1985, the new system for "the categorization of taxes, setting the amounts of incomes and expenditures, the assumption of responsibilities at different levels" was applied by the state to the various provinces, autonomous regions and municipalities under the central government (with the exception of Guangdong and Fujian). The major features of the system are as follows:

1. Budgetary incomes are set at various levels based primarily on the categories of taxes, including the fixed incomes of the central government and the localities and the incomes shared by the central and local governments.

2. Budgetary expenditures of the central and local governments will continue to be set according to their jurisdiction. Special expenditures for which the localities should not be held responsible, such as relief for extraordinary natural disasters, are to be disbursed by the central govenrment instead of the local governments.

3. In accordance with provisions set up for the limits of incomes and expenditures of the provinces, autonomous regions and municipalities under the central government is to be turned over to the central government; if the

fixed incomes of the localities are smaller than their expenditures, a certain ratio of the amount shared by the central government and the localities is to be retained by the localities; if the fixed incomes of the localities and the amount to be shared by the central government and the localities and retained by the localities still fail to cover the expenditures of the localities, a fixed subsidy is to be paid by the central government. Once the ratio for the allocation of incomes, the amount to be paid to the central government and the subsidy to be paid by the central government have been determined, they are to remain unchanged for 5 years. The localities are to be permitted to increase their expenditures if their incomes are in excess of their expenditures and to reduce their expenditures if they are in excess of their incomes. The localities are to assume responsibility for achieving a balance of payments.

4. Measures for contracting the units for the completion of large-scale budgetary projects will continue to be adopted by the two provinces of Guangdong and Fujian. The fixed amounts to be paid to the central government and the fixed amounts of subsidy to be paid by the central government are to be readjusted according to changes in the income situation after reforms have been made. Within the period of 5 years, the amount of subsidy set by the central government and paid to the autonomous regions of the minority nationalities and the provinces accorded the same privileges as the autonomous regions of the minority nationalities is to be increased at the progressive rate of 10 percent annually.

The budgetary management system for the cities, autonomous prefectures and counties (autonomous counties and cities) is to be set up by the people's governments of the various provinces, autonomous regions and municipalities under the central government in keeping with the spirit of the new system approved by the State Council.

In view of the number of changing factors which have emerged during the reform of the economic system in the last 2 years and in order to deal with the question of distribution between the central and local governments more equitably, the fixed incomes of the central government are not to be shared by the localities, while the fixed budgetary incomes of the localities may be added to that shared by the central and local governments during 1985 and 1986, so that the localities may be able to meet their budgetary expenditures and "the distribution of the total amount" may be made according to the fixed ratio.

ANNOUNCEMENTS OF ANHUI BRANCH OF PEOPLE'S BANK

Hefei ANHUI RIBAO in Chinese 4 Apr 86 p 1

[Announcement of the Anhui Branch of the People's Bank of China by Yang Changzeng [2799 7022 1073], president of the Anhui Branch of the People's Bank of China in April 1986]

[Text] In accordance with the "Interim Regulations of the People's Republic of China for the Management of Banks" and other relevant provisions, the Anhui Branch of the People's Bank of China makes the following announcements on several issues concerning the management of financial organizations:

1. All businesses involving deposits, loans, personal savings deposits, discount on promissory notes, foreign exchange, account settlement, trust, investment, rent and lease financing,and securities collecting are considered financial businesses; all banks, trust and investment companies,and rural credit cooperatives engaging in financial businesses are considered financial organizations.

2. The People's Bank of China is the organ in charge of the management of financial organizations. Any department or unit intending to engage in financial businesses and set up financial organizations or any specialized bank intending to set up branch offices must, in accordance with the limits of authority prescribed by the "Interim Regulations of the People's Republic of China for the Management of Banks," report to the headquarters, provincial, prefectural, and city branches of the People's Bank of China for approval and the requisition of the "Permit for Engaging in Financial Businesses," and, in accordance with the "Regulations for the Registration and Control of Industrial and Commercial Enterprises," follow the procedures of registration and obtain a business license before opening the business.

3. The necessary establishment of financial trust and investment companies and urban credit cooperatives in large and medium-sized cities must conform to the relevant regulations of the People's Bank of China and obtain the "Permit for Engaging in Financial Businesses" from the People's Bank of China before they can begin business. With regard to the establishment of branch offices by rural credit cooperatives, the People's Bank of China will authorize the Agricultural Bank of China to carry out the examination and approval and the "Permit for Engaging in Financial Businesses" will be issued by prefectural

and city branches of the People's Bank of China. Rural credit cooperatives are not allowed to set up branch offices in urban areas.

4. It is not permitted for local people's governments at all levels to set up local banks.

5. Non-financial organizations are not allowed to engage in financial businesses. Financial and accounting companies, financial guidance stations, agicultural economic companies, and welfare funds established by rural areas to strengthen the management of public accumulation and welfare funds of former communes and brigades are not allowed to engage in financial (credit) businesses.

Individuals are not allowed to establish banks or other financial organizations nor engage in financial businesses.

5. All branches of specialized banks and other financial organizations established without the approval of the People's Bank of China are illegal. Industrial and commercial administrative and management departments will not issue them business licenses. Enterprises, units, individual depositors, and all of their business contacts and deposits will not be protected by law. Local people's banks should order them to close down and confiscate their illegal earnings according to law. The departments concerned should investigate to find out who is to blame for direct administrative responsibilities.

The above regulations are clearly stipulated in the "Interim Regulations of the People's Republic of China for the Management of Banks" and the "Interim Regulations for the Control of the Establishment or Abolition of Financial Organizations" issued by the People's Bank of China. This announcement is made especially to repeat these regulations.

EFFECTS OF MACROECONOMIC CONTROL ON MONEY MARKET DISCUSSED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 12, 4 Dec 85 pp 22-24

[Article by Yu Ruixiang [0827 3843 4382]: "Macroeconomic Control and State of Money Market"]

[Text] Enterprises in many localities have recently complained about the shortage of funds, while newspapers and magazines have also carried articles with the appeal that the "emergency brake" should not be used to strengthen macroeconomic control and that the bank should not tighten the issuance of currency. These views have given the impression that the present shortage of funds has been caused by the bank's use of the "emergency brake" and its reduction of currency in circulation. This question deserves some study.

"Emergency Brake"

Strengthened macroeconomic control is an objective need for a planned commodity economy. This basic principle must be upheld at all times. At present, such control is even more necessary for the following reasons:

First, last year's economic growth was too fast and went beyond the capability of the national economy. In 1984, the gross national value of industrial and agricultural output increased 14.2 percent over the previous year, and from January to September this year, the total industrial output value again increased 21.1 percent over the same period last year. Such a high speed can hardly be maintained since it will be difficult for the development of energy, transportation, and raw materials to keep pace.

Second, the excessive speed of industrial and agricultural growth last year certainly had its material foundation after several years of economic development. However, stimulation from the use of foreign exchange was also one of the important causes. Such a high speed, achieved through reliance on the use of the state's foreign exchange reserve, cannot be maintained indefinitely and must be checked as soon as possible.

Third, last year's currency issuance was excessive, that is, excessive to the needs for commodity circulation.

To avoid tension and chaos in our economic life and to create a favorable economic atmosphere and financial environment for the reform, we must adopt the policy of strengthening the macroeconomic control and tightening the money market according to the general ideological guideline. We must also control the scope of credit and the amount of currency in circulation and ascertain a rational economic growth rate in order to ensure the sustained, stable, and harmonious development of the national economy. In handling the relationship between economy and finance in the past, we usually considered only the decisive effects of economy on finance and overlooked the countereffects of finance on economy. The bank's credit and cash plans must be based on production and circulation. However, these plans must not be treated as an economic appendage. If the bank must enlarge the scope of credit and increase the amount of currency in circulation no matter whether the economic growth is rational or not, then the restrictive role of finance on economy will be totally lost. Now, the strengthening of macroeconomic control in finance is stressed for the purpose of controlling the speed of economic growth by limiting the scope of credit and the amount of currency in circulation, and preventing the use of credit in the blind quest for output and output value which would bring chaos to our economic life. Of course, strengthening the macroeconomic control and tightening the issuance of currency does not mean an indiscriminate reduction of loans, but rather the need to proceed from realities with economic benefits as the main goal. We must resolutely restrict whatever should be restricted and actively support whatever should be supported in order to use money to the best advantage and to "cook with less rice." Some people believed that the bank was using the "emergency brake" in strengthening macroeconomic control and the money market was tightened suddenly and drastically with adverse effects on production and circulation. Since such a belief is based on some misunderstanding of the realities of finance, some explanation may be in order.

Let us look at the matter from the standpoint of credit and cash plans. Although the scope of credit and the issuance of currency were already excessive last year, the method of using the "emergency brake" or "going downhill" was never used in formulating the credit and cash plans of the current year. On the contrary, consideration was given not only to the strengthening of macroeconomic control, but also to the rational requirements of economic growth. The scope of credit this year has been enlarged even after the drastic enlargement of last year, while plans are still being made for the issuance of currency.

The balance of loans has by no means been reduced, but rather increased. This shows that in actual credit work, the question of using the "emergency brake" did not arise. It is true that the control of loans this year is stricter than in last year when loans were granted liberally. This is probably one of the causes for some localities' feeling that the money market has been tightened.

Now from the standpoint of currency circulation, it is true that this year's currency issuance has been reduced, but not much. In the first 6 months of this year, compared with the same period last year, the savings deposits in cash totaled 22.65 billion yuan, and the proceeds from commodity sales increased by 32 billion yuan. The fact that the amount of currency in circulation was increased under these conditions shows that the grant of loans and issuance of currency have continued to increase in the first half of this year.

For these reasons, the present problem is caused not by the adverse effects on economic development from the shortage of currency in circulation, but mainly by the excessive economic growth and the indiscriminate demands for loans. Precisely because of this, the CPC Central Committee pointed out in the Proposal for the Seventh 5-Year Plan: "In view of the present over-extended scale of construction, the amount of investment in fixed assets for 1986 and 1987 will remain roughly the same. In the last 3 years of the plan, it may be increased according to circumstances." This is a scientific approach of seeking truth from facts. It not only creates a favorable economic environment for the reform, but is also highly significant in guaranteeing a sustained, stable, and harmonious development of the national economy.

Shortage of Funds?

At present, some departments have the feelings that funds are in short supply. Besides the excessive speed of economic growth as the basic cause, there are also certain concrete problems.

(1) Last year, fund control was lax, and many projects were started on a large scale. The continuance of these projects this year has become an arduous task. In the case of Guangxi, for example, the investment in fixed assets reported by the localities in the autonomous region, after careful screening by the bank, still amounted to more than 600 million yuan, while the scope of credit defined by the central authorities was for only 300 million yuan. This shortfall was the cause of all the outcries.

(2) The enterprises did not have adequate circulating funds to meet the needs of increased production and had to turn to the bank for loans. According to incomplete statistics of eight branches of the People's Bank in Hebei, Liaoning, Heilongjiang, Shanghai, Jiangxi, Anhui, Sichuan, and Guangxi, the replenishment of circulating funds owned by the enterprises themselves amounted to 99.73 million yuan in 1984, only 0.34 percent of their circulating funds (including state allocations) for the same period, and the remaining required amount was underwritten by the bank. Under these conditions, any slight pressure from the bank would be keenly felt by the enterprises as a handicap to their operations.

(3) The poor management of enterprises and their serious financial waste aggravated the shortage of funds. As the situation now stands, the enterprises are in a position to share more profits, while the state has to underwrite their losses.

The Way Out?

In view of the present realities, the most important task for us in solving the problem of fund shortage is to check the excessive speed of economic growth and to use the available funds wisely in order to improve the economic results. Therefore, we must carefully attend to the following points:

(1) Strengthening the macroeconomic control and maintaining a sustained, stable and harmonious development of the national economy. The problem of funds is, in the final analysis, a problem of materials. There must be a normal development of the national economy and increases in the national income and material wealth before there can be a material foundation for the solution of the fund shortage problem. Therefore, it is extremely necessary for us to strengthen the macroeconomic control, to maintain a sustained, stable, and harmonious economic development and to eliminate the "exaggerations" in order to solve the problem of funds. At the same time, we must achieve a comprehensive balance, prevent the over-distribution of national income, and strictly control the scale of capital construction investment in order to increase the sources of revenues and credit funds. All these are the important means to solve the problem of funds, and none of them can be separated from a strengthened macroeconomic control and regulation.

(2) Correctly handling the relationship between needs and capability and doing our work meticulously and efficiently as long as it is objectively possible. The bank can only do what it can with loans within the scope defined by the state and then try to analyze, screen, and arrange the priority order of requirements so that the loans will be extended to the deserving ones and the money will be put to the best use. Applications for loans will be either accepted or rejected on the basis of the economic results. Those deserving support will be strongly supported and those requiring restrictions will be strictly restricted.

(3) Adopting practical and effective measures to ensure that the enterprises can continue to replenish their own circulating funds on the basis of developing their production and increasing their income. Two methods may be considered in speeding up the replenishment of the enterprises' own circulating funds: First, charging fees for the use of circulating funds allocated by the state and these fees should be kept in the People's Bank, to be used for replenishing the enterprises' circulating funds. Second, setting up a special "replenishment of circulating funds" account with the retained profits. The total retained profits will serve as the base figure and 10 percent of this figure should go into this special account. The bank will appropriately reduce credit for those failing to pay into this account and impose penalties on the amounts previously advanced. As to the circulating funds required when a new or expanded enterprise goes into operation, we must insist that the unit responsible for the project should provide 30 percent of the circulating funds, or the bank will not grant any loan. The same methods should apply to the new and expanded enterprises with investment provided for in the state budget. These methods are not only useful in controlling the scale of capital construction and the loans, but also in inducing the localities to provide for the necessary circulating funds according to regulations in building and expanding enterprises.

(4) Strengthening enterprise management and improving economic results in the use of funds. Experiences over many years have shown that it is much more difficult to improve the management and the economic results than to increase the growth speed and the output value. The improvement of management and economic results is particularly needed at a time when all enterprises are

vigorously striving for a high growth speed. Since improvement in these respects will not come in response to a general call, there must be economic legislation to hold the leadership of enterprises truly responsible for the use of funds.

FINANCIAL REFORM IN NORTHWEST DISCUSSED

Beijing JINGJIXUE ZHOUBAO in Chinese 9 Mar 86 p 4

[Article by Wang Runqing [3769 3387 7230]: "How to Reform the Financial System; A Review of the First Northwest Regional Conference on Financial Theory"]

[Text] The first Northwest Regional Conference on Financial Theory was convened late last year in Lintong, Shaanxi. Focusing on the issue of the reform of the financial system, the following two problems were explored:

I. The Professionalization of Specialized Banks

On the question of whether or not specialized banks can be operated as businesses, most comrades agreed that this must occur if the specialized banks are to enliven and enhance economic returns on their capital. Some pointed out that specialized banks are enterprises of a special nature, and are not ordinary enterprises. This is primarily reflected in the fact that: A. Specialized banks deal in special commodities--currency and credit--not ordinary commodities. B. Specialized bank revenues, expenditures and credit have their own unique laws of motion which differ from laws of commodity movement. C. The operational goals of the specialized bank include enhancing social benefit as well as increasing bank profits, which makes it more complex than the ordinary enterprise. D. The specialized bank has a unique double function and takes on financial management tasks given it by the state in addition to its business activities, which makes it different from the ordinary enterprise that is organized purely to conduct business. It is these special characteristics that require that adoption of special business practices in the process of professionalization. However, a minority of comrades believe that while it is acceptable to call for banking professionalization as a general goal, it would not likely work well at present for the following major reasons: 1. If professionalization were to be implemented, the problem of blind profit seeking would emerge. Current problems relating to interbank competition and risk-taking in credit would be unresolvable. 2. Specialized banks also have administrative and supervisory functions which are not suited to the functions of business professionalization. 3. There is too much administrative intervention at present, which would render bank autonomy meaningless. 4. It would be impossible to identify and delineate the powers, responsibilities and interests of the specialized banks; therefore it would be pointless to discuss their professionalization.

Many comrades who took part in the discussion believe that to reform specialized banks in the direction of business professionalization urgently requires a resolution of the problem of stifling control. (1) In the management of credit planning, the central bank controls both the amount and scope of the specialized bank's lending activities, allowing for a large volume of savings while limiting loan extension, which is not helpful in stimulating the use of capital. (2) Interest rates are too rigid, and no fluctuations are permitted. (3) Internal accounting is controlled too inflexibly. (4) Personnel agencies are controlled excessively so that there are frequent shortages of staff, something which is detrimental to operational work. Some people hold that the specialized bank is faced with several contradictions. The first is the contradiction between urban-rural supply and demand. The second is the contradiction between the overcentralized power of the leadership and the local banks' relative lack of autonomy. Only if these contradictions are resolved can the specialized banks gradually implement business professionalization.

To review the views of those present concerning how the specialized banks are to implement professionalization, everyone felt that there must be a genuine, close integration of responsibility, power and profit. (1) Power: includes the right to manage and adjust credit funds, to select fund-raising and credit methods, to choose loan customers, to determine the amounts and terms of loans and to exercise economic control. (2) Responsibilities: includes systems of responsibility over fund management, credit, business targets and economic accounting. (3) Profit: there must be a connection between economic returns of the banks and the economic interests of its staff. When business is good and profits exceed norms, bonuses should be raised and collective social benefits improved. The reverse should occur when business is poor.

As to the creation of specialized banks in the northwest, some comrades suggested the establishment of a Western Development Bank and a Western Animal Husbandry Bank, with general offices located in the west in order to encourage economic development in the region and make full use of its animal resources.

II. The Creation of a Capital Market and Amassing Social Capital

Everyone believed that this is an important component part of China's socialist market system, and that it should be gradually opened up. There were two different views that emerged in the discussion on the scope of the capital market. Some comrades believed that the term "capital market" refers to direct financial activities that take place outside of the state's plan for banking credit, but most comrades felt that the capital market should include indirect capital from the state's banks as well as direct capital from society. Some comrades suggested that China's capital market should: center mainly around state bank credit, allowing for all categories of credit; center primarily around indirect credit with various types of direct capital as supplement; center primarily around the vertical readjustment of capital with various categories of horizontal capital as a supplement, thereby distinguishing between the alternation of horizontal and vertical methods of capital accommodation.

As for the question of collecting social capital, everyone felt that this is a type of credit activity involving a direct contractual agreement between the extender and user of capital. The major forms of amassing social capital at present are issuing bank shares and bonds.

Everyone believed that the positive role of raising social capital should be affirmed, primarily because: (1) it is beneficial in accelerating the pace of the concentration and accumulation of capital; (2) it is beneficial in strengthening horizontal economic relations; (3) it is beneficial in increasing economic returns of society as a whole; (4) it is beneficial in the reform of the system of capital distribution of the banks; (5) it is beneficial to the transformation of consumer funds; (6) it is beneficial in importing capital and advanced technology and equipment from abroad; (7) it is beneficial to arranging for the employment of labor; (8) it is beneficial in improving the level of enterprise management. Some comrades believe it is helpful in affecting a more rapid transformation of enterprises into share-holding entities, but some comrades disagreed and believe that under socialist conditions, whether or not this should occur constitutes a major political question that requires further theoretical study.

The following problems relating to the amassing at the present time of social funds were raised: (1) the lack of leadership and the emergence of an aimlessness which is detrimental to the overall planning and disposition of funds and has led to the expansion of the scope of investment in fixed assets; (2) difficulties in controlling the direction of capital flow, which has led to blind and overlapping construction, attacks on key state projects and so on; (3) the excessive distribution of earnings which is detrimental to the rational arrangement of the growth of consumption funds; (4) administrative directives, rigid allocations, etc.

Regarding the enhancing of management over the collection of social capital, the comrades present believed that the creation and implementation by the state council "Management Code Concerning the Amassing of Social Capital" is urgently needed. Specific ideas include: 1. The fund raiser must be an economic entity with corporate status, and possess 10 to 30 percent of the total sum to be raised. 2. The principle of voluntary subscription must be adhered to. The subscribing enterprise cannot use circulating funds and bank credit to participate. 3. Capital that is to be raised for capital construction must first obtain a certificate confirming the project is part of capital construction plans from the supervisory organ. 4. Principle and interest cannot be returned until after a project is completed and returns come in. Dividends and bonuses cannot be added into costs and are to be distributed from after-tax profits. An upper margin should be delineated.

URBAN SAVINGS DEPOSITS--Beijing, 10 May (XINHUA)--Savings deposits in urban areas of China hit a record 100 billion yuan at the end of April, the ECONOMIC DAILY said today. The paper, reporting statistics from the Chinese Industrial and Commercial Bank, said this was up 25.44 million yuan from the same date in 1985. Most of the new savings has been in certificates of deposit for fixed time periods, according to the bank. [Text] [Beijing XINHUA in English 0158 GMT 10 May 86 OW] /12858

SHANGHAI AREA SHIPYARDS REPORT OUTPUT, QUALITY GAINS

Beijing CHUANBO SHIJIE [SHIP WORLD] IN Chinese No 39, 3 Oct 85 p 1

[Article: "Shanghai Shipbuilding Industry Advances Admidst Reform"]

[Text] Under the impetus of the party Central Committee and State Council policy for economic system reform, an on the basis of last year's successes, the Shanghai area's shipbuilding industry again showed new development and sustained economic and production growth. In facing this year's tasks, Shanghai companies devised battlelines of intracompany labor competition which promoted production development and quality upgrading. Gross value of industrial output [GVIO] and value of repairs both exceeded figures for the same period last year. The specifics are as follows.

1. New Ship Production Rose Steadily

GUIO through August was 69.4 percent of the annual plan, a real increase of 4.4 percent compared to the same period last year. The value of ships repaired fulfilled 99.6 percent of the annual plan, 36.9 percent more than the amount completed in the same period last year. The Zhonghua, Jiangnan, and Hudong shipyards have completed the planned repair value for this year ahead of time.

Work was completed on: one 36,000-ton freighter, four 20,000-ton freighters, one 5000/7000-ton multiuse ship, and two 5,000-ton freighters, all of which were finished and delivered according to plan. Work was begun on: two 35,000-ton freighters, one 65,000-ton tanker, one 20,000-ton freighter, two 5,000/7,000 ton multiuse ships, and two 5,000-ton tankers, all under construction according to plan.

Each shipyard completed its own responsibilities. The Jiangnan Shipyard was assigned construction of six ships in the 10,000-ton-and-over class in the annual plan, and has actually completed three to date. The current rate of ship construction is very fast. A 20,000-ton No 3 freighter has already been launched and tested; docking equipment for a No 4 boat has been completed. Of those ships under construction; a No 1 35,000-ton freighter is in the process of being assembled in the slipway while a No 2 ship has finished assembly and is on the slipway. Besides fulfilling its own responsibilities, this shipyard has also agreed to take on the final phases of construction, testing, and delivery of a 300-container-capacity container ship for the Wuhu Shipyard. This ship has already been transported to the Jiangnan Shipyard and is currently undergoing final construction.

The Shanghai Shipyard's status is also very good. It was slated to produce three 10,000-ton and up ships in this year's plan. To date, two ships ahve been completed and a third 20,000-ton freighter (a Zhenfen No 9) is undergoing in-harbor testing. Confidence is very high at this yard as it is obvious that their annual plan quota will be fulfilled ahead of schedule. At the Qiuxin Shipyard, the construction rate is also emphasized; two ships have been finished and delivered so far this year. Two 8,200-ton No 3 container ships have benn constructed by the Zhonghua Shipyard and are currently being tested at berth.

In order to be even more outstanding, the Hudong Shipyard conducted special worker mobilization meetings to accelerate construction. Many workshops, technical offices and other personnel groups stood up and made it plain that they were determined to fight on to the end of the year. With the completion of a 36,000-ton freighter as a base, the factory made even more progress in improving its pace construction. At the moment, a 36,000-ton No 2 freighter has been launched and will soon be delivered. Construction on a No 3 ship has also been stepped up, with launching in the near future.

Engine-production results were also good. Cumulative statistics through August show completion of 130,246 horsepower, 55.6 percent of the annual plan, and an increase of 24 percent over the same period last year. Anchor chain production achieved 77 percent of the annual plan, up 19.3 percent over the same period last year.

2. New Improvements in Product Quality

New quality improvements over the current year were a result of several factors. All shipyards continued to strengthen their quality work by employing the quality-first directive, setting up quality guarantee systems, and establishing quality criteria for acceptance of goods. In addition, quality grades and "create excellence" programs were vigorously initiated in order to make employees firmly aware of the great importance of improving product quality.

The 21,000-ton No 4 coal boat and 20,000-ton No 1 coal boat built by the Jiangnan Shipyard completely conformed to principal measurements and deflection requirements. The cabins of these boats were also precision tested for rate of leakage with an average 1.05 instances per cabin, while the 20,000-ton freighter's rate surpassed the standard at 0.3. The rate of meetiong delivery testing requirements the first time reached 99 percent. Speed-test results all surpassed contract requirements. Four 21,000-ton bulk cargo ships have been in service for a half year; their owners expressed satisfaction with their quality. A No 2 ship fared well under testing in a gale-force storm--the ship's internal structure and other parts were all in good technical condition.

Following identification and resolution of key problems, the Hudong-produced medium-speed diesel 12E390 V-engine had increased performance as well as far superior reliability. After installation and testing in a ship, the engine received praise from users.

The principal measurements of a 5,000-ton ocean freighter built by the Qiuxin Shipyard reached blueprint specifications, and the same welds were very well formed. Installation and adjustment of main equipment, engine, and electrical systems all conformed to plan. After an ocean-going test of all principal technical capabilities attained design specifications, the ship took its maiden voyage to Japan where it received good reviews from its owner.

The 3,200-horsepower tugboat built by the Donghai Factory has completed work called for in the blueprint and is ready for testing. The quality of this boat is excellent and surpassed all of the design technological targets.

The 5,000/7,000-ton multipurpose freighters constructed by the Shanghai and Zhonghua shipyards also had new improvements in both welding and assembly quality.

BRIEFS

STATE EXPANDING SHIPBUILDING CENTERS--Beijing, 12 May (XINHUA)--China plans to expand six shipbuilding centers in the 1986-90 period, according to INTERNATIONAL BUSINESS journal. These are the Dalian shipyard, the Zhonghua, Shanghai, Jiangnan and Hudong shipyards in Shanghai and the Guangzhou shipyard. By 1990, their output will make up for two-thrids of the total of the China State Shipbuilding Corporation. Projects planned during the next 5 years include improving the servicing facilities for a slipway for 100,000 DWT-class ships in Dalian shipyard, and adding an assembling and welding platform to enable Hudong shipyard to produce 60,000 DWT-class ships. The China State Shipbuilding Corporation has contracted to build 112 ships and marine oil-drilling platforms for export since 1979, earning 1,270 million U.S. dollars of foreign exchange. In the first quarter of this year, it signed contracts with foreign firms on the export of eight ships totalling 220,000 DWT. The journal said that China is now able to build ships up to any international standards, sailing in any navigable water and carrying flags of any nation. MONGGOL WIND-DRIVEN GENERATORS--The Nei Monggol Autonomous Region has been vigorously producing wind-driven generators. According to statistics, the region has mainline and accessory facility manufacturing enterprises with an annual capacity of 15,000 units at present. Last year these enterprises produced 8,600 generators, 64 percent of the national total. Over the last few years, the Nei Monggol Autonomous Region Machinery Office has tried to change the backwardness of its pasture, forest, and mountain areas by greatly developing wind-driven generators. Last year they successfully developed eight models of wind-driven generators, three of which, the 50-, 100-, and 2,000-Watt models, have been put into large-scale production. The Shangdu Animal Husbandry Equipment Factory's 100-Watt model is a fourth generation model that has already been improved 27 times with a resultant 54 percent decrease in production costs and the lowest domestic price among comparable products. This generator also received the Autonomous Region's "excellent" rating. Because the wind-powered generators it produces are high quality, inexpensive, and easy to put into operation, the factory has already sold generators to over 20 provinces, cities, and autonomous regions. TIANJIN TOWNSHIP ENTERPRISE PRODUCT STANDARDIZATION PUSHED

Beijing ZHONGGUO XIANGZHEN QIYE BAO in Chinese 14 Dec 85 p 1

[Article by Zhang Xiaojian [1728 2556 1696]: "Tianjin Municipality Township and Town Enterprises Make Remarkable Progress in Standardization; In a Survey of Nearly 3,000 Products, 21 Percent Put into Practice National Standards or Department Mandated Standards, and 64 Percent Put into Practice Enterprise Standards; The Quality of 8 of These Products Occupies a Forward Position Nationally"]

[Text] With market product competition increasingly fierce, the Tianjin Municipality township and town enterprise management departments are confronting the problems of some township and town enterprise products lacking trademarks and their products having low and uneven quality. All of the municipality's township and town enterprises have implemented across-the-board product standardization, thus bringing about a noticeable improvement in product quality and economic results and notable social benefits.

Recently, according to a survey of 2,900 different township and town enterprise products, 260 have implemented national standards and 356 have implemented department mandated standards, representing 21 percent of the products. More than 1,800, or 64 percent, have implemented enterprise standards. A portion of these enterprise products has achieved advanced national and international quality standards. In promoting standardization they have focused on the following tasks:

1. Training and establishing a corps of standardization personnel: since last year the municipality, districts, counties, townships, and towns have adopted the practice of running classes at different levels, holding separate professional training classes for basic standardization knowledge so that standardization personnel will be able to realize a new national standard in their work. More than 2,300 key technical staff were trained, forming a complete corps of standardization personnel. This year Jinghai County held separate standardization training classes for the county's 27 townships, and allocated full-time cadres for managing standardization work in each township. Ninghe County established a county standardization center and standardization work group office to promote the development of standardization work, and strengthened supervision and leadership.

2. Formulation of enterprise standards: since 1983, township and town enterprises, scientific research departments, and municipal industries have joined forces in manufacturing one after another a group of new scientific research products. These products have no domestic standards to follow. The Municipal Township and Town Enterprise Department's formulation of enterprise standardization for these products is an important task in promoting standardization. By the end of this October, the Municipal Bureau of Standards, following Municipal Township and Town Enterprise Department examination and approval, had formally issued 77 township and town enterprise product standards using Tianjin Municipality enterprise standards. Adopting international standards and foreign advanced standards, the Municipal Bureau of Standards recently certified six product enterprise standards for the small air compressors of Dongjiao District, the highly purified calcium stearate of Jinghai County, the organic Kaolin of Xijiao District, the building joints of the Danggu District, the galvanized steel tubing of Beijiao District, and electric welding rods of Dagang District.

3. Supervised testing of key products and of development of superior products: this year the Municipal Township and Town Enterprise Department and Municipal Bureau of Standards have jointly instituted supervised testing for plugs and outlets, beer, electric blankets, and ballast manufactured by township and town enterprises. When products are found to be substandard, the enterprise will have a limited period to improve and will be compelled to produce according to standards. With regard to rural enterprise innovative and good products, when asked to submit innovative and good product projects, standardization implementation forms must be submitted; forms for enterprise internal-regulation standards which are higher than national and department standards must also be submitted. Those that are qualified must also adopt international standards, thereby guaranteeing stable quality in innovative and good products. The eight products which have been judged this year as innovative and good in the municipality are organic Kaolin, bare copper wire, electric welding rods, ceramsite, building joints, and so forth. Since undergoing testing by the relevant municipal organs, product quality of all of these holds a leading position domestically, as they have received good evaluations.

SMALL-SCALE ENTERPRISES

SICHUAN TOWNSHIP, TOWN ENTERPRISE 1985 OUTPUT UP 48 PERCENT

Chengdu SICHUAN RIBAO in Chinese 16 Dec 85 p 1

[Article by Shen Xiangju [3088 7449 5468] and He Zhengkuan [0149 2973 1401]: "Sichuan's Township and Town Enterprises Complete Annual Plan Ahead of Time; Great Achievements in the Last Year of the Sixth 5-Year Plan; Gross Output Value Has Already Reached 13.1 Billion yuan, the Best Year in Economic Results in the Sixth 5-Year Plan Period"]

[Text] The steady development of Sichuan's township and town enterprises continued this year, exceeded the year's quota and completed the full year's plan ahead of time, and was the best year in economic results in the Sixth 5-Year Plan period. By the end of November, gross output value had already reached 13.1 billion yuan and income from sales had reached 10.28 billion yuan, 48-percent and 53-percent increases respectively over the same period last year, and correspondingly there also was an increase in tax funds turned over to the state and in profits earned.

With the province's rural industrial structure undergoing readjustment this year, farmer enthusiasm for running enterprises is soaring and rural enterprises continued to realize enrichment and development. Compared with the same period last year, Sichuan's township and town raw coal production rose by 28 percent, reaching 20 million metric tons. Iron ore, electricity generated, cement, brick and tile, food processed, silk products, hemp products, and tea leaves all grew by considerable margins. Currently, the output value realized in agricultural sideline processing, energy, mining, building materials, construction, and other industries is already over 70 percent of gross output value. Product mix is becoming increasingly rational.

This year Sichuan party committees and governments at all levels have fully emphasized correctly guiding the healthy development of township and town enterprises, and, in the new circumstances of the state tightening credit and controlling the scale of credit, conscientiously carrying out the provincial committee's guiding principle of "finding a living when things are tight, finding good things during shortages, and going all out to cooperate and make it through hardship," planning rationally, gauging abilities and acting accordingly, eliminating items that cannot go into operation this year, cutting down the scale of projects under construction, opening up multiple channels for funding sources, and guaranteeing that a large group of technological improvement items and priority items is successfully built and put into operation.

The provincial government will promptly provide 10 million yuan in special funds to support the development of "short, appropriate, and quick" items in rural enterprises, various localities will still bring in more than 10 million yuan in funds from various relevant departments inside and outside the province, and the masses will be mobilized to accumulate more than 700 million yuan in capital to alleviate the contradictions of insufficient capital. The township and town enterprise system is to do a solid job of renewing and reforming the potential of old enterprises, use the old to lead in the new, and strengthen the vigor of enterprises. Peasant household industries and joint enterprises are developing vigorously, and have become a new force in the rural enterprise system.

SMALL-SCALE ENTERPRISES

SICHUAN S&T PERSONNEL AID TOWNSHIP, TOWN ENTERPRISES

Shanghai WEN HUI BAO in Chinese 3 Mar 86 p 1

[Article by reporters Shen Zhuanxin [3088 1413 0207] and Deng Zhong [6772 6850]]

[Text] In order to bring modern science and technology to the industries of rural villages, more than 10,000 of Sichuan's science and technology personnel are helping to raise the management level of small and medium-sized township and town enterprises and are promoting technological progress. This activity is being carried out directly under the orders of the Sichuan provincial government.

Sichuan Governor Jian Minkuan [5592 3046 1401] realizes that science and technology, information and knowledge are required to make Sichuan wealthy as soon as possible. In promoting production in the peasant villages, science and technology are inseparable from the development of the commodity economy. Only when the commodity economy is developed to a certain level can science and technology be applied to the intensive requirements of productions. At present, there are many localities in Sichuan with self-sufficient small peasant economies, especially among the minotiry peoples dwelling in the mountainous regions and outlying districts, who lack the concept of a commodity economy. Moreover, lacking this kind of concept, they also lack any enthusiasm for the development of commodity production and naturally can have no interest in science and technology. When they arrived at the villages, the science and technology personnel had to develop a commodity economy to set an example for the farmers.

These 10,000 science and technology personnel were all transferred from institures of higher learning, scientific research units and large factories. The process of helping small and medium-sized township and town enterprises takes many forms. Some of them make up a cooperative network of science and technology personnel, forming a rather complete cooperative brigade of specialists serving the local small and medium-sized township and town enterprises. Some allow the technologically superior enterprises and resource-rich locations to sign joint agreements, and help by fitting in with their vocational specialties. Some produce many kinds of joint entities passing on their managerial knowledge to the town and township enterprises and cultivating talent. Some are building science and technology service organizations, providing consultation and leadership to the small and medium-sized township and town enterprises. And some have chosen suitable comprehensive experimental bases for the institutions of higher learning to carry out education, research and the promotion of mutual cooperation, trained a large backbone of science and technology for the peasant villages, and promoted the production of local enterprises.

ANNIVERSARY OF SINO-POLISH SHIPPING COMPANY MARKED

OW170826 Beijing XINHUA in English 0809 GMT 17 Apr 86

[Text] Gdynia, 16 April (XINHUA)--Chinese Minister of Communications Qian Yongchang expressed his thanks here today to the Polish Government for its "friendly help" to China by founding the Sino-Polish Shipping Company 35 years ago.

Addressing a ceremony marking the 35th anniversary of the founding of the Sino-Polish Shipping Company, the minister said the founding of the company played an "active role" in helping China break the economic sanctions imposed on China by the then government of the United States. The Chinese people and government appreciate and will remember forever this friendly help as an expression of proletarian internationalism.

The company has also played an important role in developing the economies of the two countries and made contributions to the friendship between the two peoples, he added.

With a more than 9-time increase in its volume of capital, the Sino-Polish Shipping Company now owns 23 ships with a total capacity of 350,000 tons, about 3.5 times over the first days of its founding. In the past 35 years, it has made about 2,300 voyages, carrying a total of 22.5 million tons of goods.

Adam Nowotnik, chief of the Polish Bureau of Maritime Economy, said that the company would go down in history with its great contributions which were made under extremely difficult and complicated situations to the mutually beneficial cooperation between the two countries. He expressed his confidence that the company will surely make greater contribution in the future to developing the economic cooperation and friendship between the two peoples.

FOREIGN TRADE AND INVESTMENT

BRIEFS

CSSR CHAMBER OF COMMERCE OFFICIAL--Beijing, 27 April (XINHUA)--Song Ping, state councillor and minister in charge of the State Planning Commission, met here today Ludvik Cerny, chairman of the Czechoslovak Chamber of Commerce and Industry, and his party. During the meeting, Song and Cerny expressed the wish to further economic relations and trade between the two countries. Cerny and his party arrived here yesterday at the invitation of the China Council for the Promotion of International Trade. [Text] [Beijing XINHUA in English 1224 GMT 27 Apr 86 OW] /12232

POLAND VEHICLE EXPORTS--Warsaw, 8 May (XINHUA)--Poland will export 15,000 cars and trucks to China this year under a contract signed here today. The contract, worth more than 100 million Swiss francs, constitutes Poland's largest export of cars and trucks. The vehicles China will import include Poland's cars, Fiat 125P, Fiat 126P and Jelcz trucks. According to Poland's official news agency PAP, Poland last year exported 7,600 trucks and coaches to China, its largest car trade partner. CHEMICAL DELEGATION IN SFRY--Belgrade, 14 May (XINHUA)--Mijat Sukovic, Yugoslav vice president of the Federal Executive Council, today discussed with head of the Chinese chemical delegation on cooperation between their countries. Sukovic said developing trade and achieving a trade balance with China are in line with Yugoslavia's strategic interests. He said his government supports all economic and business cooperation between the two countries. The Chinese delegation arrived here last week for business negotiations at the invitation of Ina-Naftagas, one of Yugoslavia's four big petroleum companies. PROBLEMS OF WAGE, LABOR RACE DISCUSSED

Beijing BAN YUE TAN in Chinese No 5, 10 Mar 85 pp 27-29

[Article by Hu Xiaoyi [5170 2556 5030]: "On the Issue of Wage and Bonus Race"]

[Text] Currently, the phenomenon of a race has appeared in regard to the issue of wages and bonuses. Such a race exists between enterprises and state organs and establishments and among different enterprises and units. Although there are some objective causes such as imperfect policies and incomplete measures, the phenomenon of a race is caused mainly by the fact that some people still have some confused ideas. It is necessary to present the facts, reason things out, and clarify such ideas.

In the wage reform of 1984, seeing that state organs and establishments had a bigger raise than enterprises, the staff members and workers of some enterprises felt that they suffered losses and demanded that they get the same level of raises as that of state organs and establishments. Judged by the wage increase of 1984 alone, the employees of state organs and establishments did get a bigger raise than the staff members and workers of general enterprises. But if we look back a few more years and review the situation of wage increases since the 3d Plenum of the 11th CPC Central Committee, we will find out that in the past 7 years the amount and rate of wage increases of enterprises' staff and workers have been higher than those of the employees of state organs and establishments. In 1978, the average annual wage of the staff and workers of state-run industrial enterprises was 21 yuan higher than that of the employees of state organs. Six years later in 1984, the average annual wage increase rate of the employees of state organs was 49.8 percent while that of the staff and workers of state-run industrial enterprises was 56.8 percent. The average wage of enterprise staff and workers was 79 yuan higher than that of state organ employees. In some industries, the rate of wage increases was even greater. Even after the wage reform of 1984, the wage level of state organ employees is still lower than that of enterprise staff and workers. It is thus clear that the argument that enterprise staff and workers suffered losses in the wage reform compared to the cadres of state organs is groundless.

With regard to this issue, we should also correctly understand the differences in the roles and wages of white-collar and manual workers. State organs and establishments are units where white-collar workers are concentrated. In the past, due to the influence of "leftist" ideas and various other reasons, the role of white-collar workers was underestimated and the wage and income level of China's white-collar workers remained low over a prolonged period of time which was very abnormal. The material wealth of society is created jointly by white-collar and manual workers. Generally speaking, the degree of complexity involved in white-collar labor is higher than that of manual labor. Along with the development of the modernization drive, the achievements of white-collar labor will be increasingly prominent. Therefore, it is rational for the wage level of white-collar workers to be a little higher. Not only is this an indispensable condition for white-collar labor itself but more importantly it will be conducive to the development of social production, the improvement of material and cultural living standards and the literacy of the working class and all laborers. In recent years the party and the government have adopted a series of measures including the one adopted in 1984 during the wage reform to allow a higher wage increase for the employees of state organs and establishments. This is very necessary for gradually changing the low wage level of China's white-collar workers and carrying out rational readjustment of wage relations.

Of course, this does not mean that the wage level of all manual workers should be lower than that of white-collar workers. The socialist distribution principle of personal consumer goods is to each according to his work. Anyone who has worked hard and made greater contribution to society deserves greater reward no matter whether he or she is a white-collar or manual worker. Those manual workers whose work conditions are poor and labor is strenuous ought to have higher wages than those of ordinary white-collar workers.

Seeing that other enterprises have a higher wage and bonus increase than their enterprise, some enterprise staff and workers demand that they be treated the same as those with higher wages and bonuses in disregard of their conditions and economic results. Such thinking of enterprises racing against each other should also be corrected. At present, the overwhelming majority of enterprises have carried out the second step in the substitution of tax payment for profit delivery and the distribution relation between the state and enterprises has been clarified tentatively. As long as enterprises work hard to increase production and economic results, enterprises' profit retention and their staff and workers' wages and bonuses will increase accordingly. Of course during a certian period of time, there will be some differences in the amount and rate of wage and bonus increases between different enterprises. Such differences generally are determined mainly by the degree of efforts made by enterprises and their staff and workers in production, operation, and management. Therefore, enterprises should compare with each other in regard to production, operation, management, product quality, and labor efficiency. In other words, they should compare their contributions. Without better production and higher efficiency, how can the personal income of staff and workers increase? As for the objective factors that caused the great disparity in the wage levels of enterprises, the state has adopted some control and regulatory measures and is planning to draw up additional new measures and work out better solutions.

Some staff and workers, especially those in state-owned enterprises, have strong reactions to the issue that some members of society have excessively high income. We should look at this issue from two angles. On the one hand, China still lacks experience in economic reform and some policy measures are not perfect and mature, thus resulting in the phenomenon that some members of society (such as individual industrial and commercial households in urban and rural areas) have excessively high income. In view of this, the state is now working hard to draw up improvement measures. On the other hand, we should not fail to notice that the income composition of staff and workers is not totally comparable with that of certain members of society. For instance, the wages of staff and workers basically can be used all in consumption while part of the income of individual industrial and commercial households should be reinvested and cannot be used in personal consumption. Moreover, there are risks involved in the businesses of individual industrial and commercial households. It is inappropriate to make indiscriminate and blind comparison. As for individual members of society who use illegal means to obtain high income, they will reap what they have sown in due time because their activities are proscribed by formal decrees of the state.

A wage and bonus race not only can cause ideological confusion and undermine the stable and united political situation but it also will cause an adverse effect on China's economic growth. If units of lower wage and bonus levels vie to emulate those of higher wage and bonus levels in disregard of conditions and contributions, it will be inevitable for China to go back to the "big communal pot"--the old trail of egalitarianism. What is more serious is that it will result in rotating wage increases and loss of control over consumption funds and cause the consumption level to rise far beyond the bearing capacity of economic growth, thereby resulting in inflation and sharp price increases. If so, both the immediate and long-term interests of the broad masses of staff and workers will be harmed to a great extent. Therefore, it is necessary resolutely to prevent and overcome the tendency for a wage and bonus race.

LABOR SERVICE COMPANY HELPS WORKERS IN SHEKOU

OW071808 Beijing XINHUA in English 0642 GMT 7 May 86

[Text] Shekou, 7 May (by XINHUA correspondent Fang Xin)--Workers in the Shekou industrial area--a special area close to Hong Kong now open to foreign, Hong Kong and Macao investment--can loose their jobs but not their "rice bowls".

The local labor service company, which is responsible for recommending workers to factories using foreign investment, provides food allowances to those fired by their bosses and helps them find new jobs. "The workers are required to contribute 20 percent of their monthly wages to the company's welfare program, which covers medical expenses, old-age pension and unemployment subsidies," said Zhang Hankuang, manager of the company.

Every month about 60 workers fired from the 100-odd factories with foreign investment in this district come to the company for help, Zhang said.

According to China's law of labor management for joint ventures using Chinese and foreign capital, workers can be fired for violating factory regulations or because of the factories' efficiency measures. They also may resign in order to look for better jobs, Zhang added.

The labor service company will then send them on training courses to improve their skills or learn new skills. During the training, they receive a monthly food allowance of 30 yuan from the company.

[Beijing XINHUA in English in its repeats of this item at 0947 and 1418 GMT on 7 May inserts the following paragraph at this point: "The company will recommend them to other employers, Zhang said, adding that a recent survey conducted by the company shows that most of the retrained workers work well at their new jobs."]

"We have managed to ensure the independence of enterprises using foreign investment in management," Zhang said. "Meanwhile, we try to retain the good aspect of China's current labor system under which no worker is fired unless he or she is convicted of criminal offenses or responsible for serious accidents."

The Shekou Labor Service Company, set up in 1981, serves as a labor pool for the 20,000 workers in the district managed by the China Merchants Steam Navigation Co. Ltd. of Hong Kong, Zhang said. It signs labor contracts with local enterprises on behalf of the local authorities. Such contracts stipulate the responsibilities for both the employers and employees, and the conditions for promotion and punishment.

While seeing to it that the legitimate rights of the investors are protected, Zhang said, the company tries its best to ensure the interests of the employees.

One case involved a Japanese company in the district, which failed to meet the contract requirements for payment and fringe benefits. On behalf of the 2,000 workers there, Zhang said, the Labor Service Company negotiated with the Japanese business and succeeded in making it honor the contracts.

LABOR AND WAGES

OVERSEAS RENMIN RIBAO REPORTS ON XIAN TECHNICIANS

OW160528 Beijing XINHUA in English 0139 GMT 16 May 86

[Text] Beijing, 16 May (XINHUA)--A network to promote the circulation of technicians and technical information between factories has been built up in Xian, capital of Shaanxi Province, the overseas edition of PEOPLE'S DAILY reported.

The network helps technicians to transfer from one enterprise to another and assists in technical training, co-operation and consultancy.

The city, which has a population of 5,400,000 first set up a technician exchange center in August, 1984. Since then, the center has been approached by 8,700 technical workers, 3,000 of whom have applied for transfers. Of these, 834 have been helped to change jobs.

Personnel exchange is already paying off for some enterprises. One suburban cable plant has saved more than 300,000 yuan investment and achieved an output value of 600,000 yuan a month with the help of seven technicians introduced by the technician exchange center.

The government has been keen to promote the exchange of skilled workers. Premier Zhao Ziyang called for the "rational circulation of the labor force" at the annual session of the National People's Congress earlier this year to change the existing personnel management system which makes it difficult for workers to change jobs.

BRIEFS

RETIREES TOTAL OVER 16 MILLION--Beijing, 10 May (XINHUA)--China has 16.37 million retirees by the end of 1985, is equal to some 10 percent of the present workforce, according to an official release by the State Statistical Bureau today. [sentence as received] The number of retirees averaged 1.64 million a year over the past five years, the bureau said. The government paid out pensions totalling 14.5 billion yuan in 1985, averaging 935 yuan per person. [Text] [Beijing XINHUA in English 1457 GMT 10 May 86 OW] /12858

NEEDED RAILROAD ELECTRICAL EQUIPMENT IMPROVEMENTS OUTLINED

Beijing TIEDAO TONGXIN XINHAO [RAILWAY COMMUNICATION AND SIGNALS] in Chinese No 1, Jan 86 pp 2-6

[Article by Electrical Bureau, Ministry of Railways: "Reform, Innovate, Forge Ahead, Actively Pitch In for the Magnificent Practice of Carrying Out the Seventh Five-Year Plan"]

[Text] 1986 marks the first year of the Seventh Five-Year Plan. The CPC Central Committee has called upon us to adopt a spirit of reform, innovation and forging ahead, to pitch in actively for the magnificent practice of the Seventh Five-Year Plan, and to take a firm grip on the first year tasks of the Seventh Five-Year Plan, which hold major significance for fulfillment of the Seventh Five-Year Plan. Railroad transportation currently remains a conspicuously weak link in the national economy that is not in keeping with needs for development of industrial and agricultural production. A change in this passive state of affairs is one of the key problems to be solved during the Seventh Five-Year Plan period. The central task is major efforts to upgrade overall transportation capabilities to ameliorate the shortage of transportation while still running trains on time, providing excellent service and producing fine results, and to make ready a certain reserve for the booming of the national economy for the next 10 years. Electrical departments have to plan their own work in accordance with the central tasks and overall goals of railroad transportation. They must insure that highest social results are obtained and quick results are obtained from little investment in electrical equipment. They must meet railroad needs by tapping the potential of existing equipment, through the development and importation of new technology, and by using advanced communications and signaling equipment, making the most of their own special strengths and roles to improve overall transportation capabilities. It is with these goals in mind that ideas and views about work for this year and several years to come are proposed.

I. Intensified Building of Spiritual Civilization, Firmly Establishing a Psychology of Service to Transportation.

Firm establishment of a psychology of service to transportation has been a focal point in electrical work during the past several years, and it has also been a major ingredient in electrical units' building of spiritual civilization. To persevere in service to transportation is to think about transportation matters that require thinking about, and to be anxious about transportation matters about which one should be anxious. These thoughts should act as guidance for bringing about a new situation in electrical departments and be translated into conscious action. In recent years, staff members and workers in our electrical system have done a large amount of work in the realm of service to transportation in actively expanding the scope of service, showing to the full the role of electrical departments in transportation endeavors. In constructing trains and the "three major kinds of vehicles," in particular, electrical staff members and workers have toiled arduously on each of the links of research and development, installation, utilization and maintenance, scoring outstanding results in raising transportation capabilities and insuring safety. In recent years, they have also ushered in a new situation in grade level crossing safety. Construction of grade level crossing signals during 1985 was faster than in any year.

For some time to come, we believe that the policy for electrical work should be: to center on transportation, to make the most of advantages, to expand service, and to forge ahead. In 1986 and during the period of the Seventh Five-Year Plan, the following key tasks should be taken firmly in hand in order to improve transportation capabilities.

(1) Coordination of requirements for departure loading and train make-up, rendering a good performance in the following several regards:

1. Conscientious critiquing of how the Model 309 radio train dispatchers and the 400 kHz inductor two-way telephones are being used on the electrified section of the Fengtai-Shahezheng-Datai Line [in Greater Beijing], making proposals for improvements to the system.

2. Careful attention to completion of the work of importing radio train dispatching equipment on the Shijiazhuang-Yangquan-Taiyuan Line to solve the problem of radio contact among trains in mountain areas.

3. Need to organize and carry out research on automatic blocking interval time and signal display systems in making up overly long trains, providing a technical plan for optimum through capabilities between areas. Active research on the compatability of the three display system currently in use or import of a new model four display system automatic blocking equipment and selection of a location for testing as soon as possible.

4. Experiments on electrical interference on signal equipment caused by large traction current in connection with the make-up of trains from departure on the Fengtai-Shahezheng-Datai Line to obtain experimental data to counter interference.

5. Active matching of station railroad siding protracted movement equipment, replacing interlocking electrical circuits.

(2) Coordination of expanded marshaling of passenger trains.

1. Careful attention to the placing in production of 130 watt receiving, amplifying and recording train broadcasting system, providing long passenger trains with radio broadcast equipment.

2. Telephones aboard passenger trains to solve communications problems on long passenger trains.

(3) Coordination in abolition of cabooses

1. After importing inter-area axle-calculating blocking equipment, trials should be urgently run in order to gain experience in their use that can be disseminated.

2. Critique of the use of inter-area inspection equipment such as axle-calculating equipment on the non-electrified Qiqihaer section, of the axle calculating equipment on the electrified Baoji-Fengxian section in the Zhengzhou Railroad Bureau, and the 25 Hz long track electric circuit in the Chengdu Railroad Bureau, using it in conjunction with Model 64D automatic blocking equipment for inspection of entire trains.

3. Research and development of inductance inspection devices for the last car on trains.

(4) Coordination for improvement of classification capabilities at railroad hubs.

1. Continued development of yard radio classification equipment, critiquing their use, formulating management methods and establishing maintenance and repair systems.

2. Spread of the use of hub classification supervisory systems.

3. Energetic development of mechanized humps and semi-automatic humps, with general installation of hump locomotive signals.

4. Installation of speed regulating equipment on classification lines, i.e., use of small retarders to bring about further destination braking to improve the hook-up rate.

5. Intensification of experiments for ZK_3 structural improvements in order to insure hump switching equipment safety.

6. Step-by-step development of electric power concentration in grade crossing switching areas, with grade crossing switching single hook release operation being used for the present.

(5) Coordination of the improvement of inter-area traffic capacity (including intermediate stations).

1. A change to 8 minute intervals, insofar as possible, for double track three display automatic blocking.

2. Active carrying out of pilot projects for twin track bi-directional automatic blocking.

3. Development of marshaling control and warning equipment in double tracked sections.

4. Improvement of the reliability of existing automatic blocking equipment for a reduction in the inter-area red light breakdowns.

5. All stations without separation equipment on busy single track lines should increase the number of signal warning points and try out train speed control equipment in a planned way in order to improve safety.

6. Acceleration of the installation of locomotive signal code equipment at intermediate stations on mainlines and on surrounding lines. Places having requisite conditions should install locomotive signaling equipment between stations and lines for an expansion of the scope of application of "three important matters."

7. Active development of dispatching and marshaling equipment on cut-in sections associated with double tracks to solve the problem of insufficient capacity and the fairly slow increase in traffic capacity, and of raising capacity of single line sections where double tracking is not possible within the near future such as on the Lanzhou-Urumqi Line.

8. Active promotion of alternating current 480 ohms track electrical circuit biaodiao [2871 6148] plans to reduce the number of red light problems that occur during rainy weather on sidings in classification stations.

9. Active effort to import or experiment with micro-computer controlled dispatching and marshaling, attention to be focused on the Baoji-Fengxian section of the Zhengzhou Railroad Bureau as a pilot project for the acquisition of experience.

10. Active promotion of solar energy as a source of power on sections that lack other sources of electricity.

11. Installation of double acting switching secondary terminal mitie [1378 6317] inspection equipment, first for operating locomotives and later for switch engines, and first for trunk lines and later for spur lines, the better to insure double acting switch safety.

2. Serious Attention To Improvement of the Economic Management System To Advance Development of Electrical Work

Reform of the grassroots level economic management system has moved ahead in recent years in a process of feeling the way. Numerous electrical sections have changed their internal management structure and have perfected economic responsibility systems whereby responsibilities, rights and benefits are linked, and they have revamped their external economic relationships, carrying out numerous courageous efforts at reform. The thrust of these reforms has basically been on target and development has been healthy.

The organizational set-up of electrical sections has devoted attention to the carrying out of reforms that fit in more with serving the needs of the grassroots. Electrical section organizations have improved their production, dispatching and direction systems; They have set up a special quality control functional system; they have strengthened their technical management systems by having an engineer head them; and they have emphasized direct service to production and grassroots management organizations by overall units for personnel, finances, planning and materials. They have paid general attention to making the most of the managerial role of the foreman level of the grassroots management system, some of them making work foremen centers for production direction while others have used foremen as a small economic entity within electrical sections. In the production direction section, general attention has been paid to the need for reform of maintenance and repair methods. Inspection and repair bases have been set up that are geared to lateral management organizations. Practice has demonstrated that these methods have rather effectively promoted development of electrical work.

Second, attention has been directed to the goal of improving transportation effectiveness by directly linking electrical economic responsibilities and earnings from transportation, i.e., the carrying out of fruitful efforts to forge a link with branch bureau economic effectiveness. For example, the Nanjing electrical section ruled that in final economic accountings with branch bureaus, the conversion set per ton kilometer would be increased by between 1 and 4 percent, 4 and 7 percent, and more than 7 percent; thus, electrical operating expenses would correspondingly increase by 1, 2, and 3 percent. In the Jinan Bureau, the Xuzhou Branch Bureau tried out a "four in one" (stations, maintenance, rolling stock, and electrical work) switching responsibility system for the Xuzhou marshaling station that unified standards of responsibility for transportation production, responsibility for division of labor, and integrated evaluations, and set uniform labor compensation for better solutions to problems of excessive disparity in distributions among units, which aroused enthusiasm in all quarters and scored remarkable economic results. Though these accounting methods cannot be reflected entirely in the role of electrical work in overall transportation effectiveness, nevertheless, a heartening step has been taken.

The aforementioned reforms are still only a preliminary effort. There is a very long distance to go to reach the requirements set in the "CPC Committee Decisions on Economic System Reforms," and numerous problems remain that require our exploration. This requires that we combine a spirit of innovation with a realistic attitude and conduct constant critiques as we gain practical experience so that reform of the economic system of the electrical department will thrive.

3. Further Spread of Reforms in Maintenance Work, Steadily Improving the Quality of Electrical Equipment Performance

Reform of the electrical system's maintenance work began in 1979 and has been going on for nearly 6 years. The fundamental task in reform of maintenance work lies in using guaranteed equipment reliability as a basis for improving the extent to which equipment may be used, satisfying to the maximum degree needs for equipment in transportation production, the focus to be using every available means to improve equipment reliability (the reliability of both individual pieces of equipment and of systems).

The fundamental substance of maintenance work reform lies in the following: To change repairs that are presently done on the road to in-shop repairs whenever possible, i.e., to replace at regular intervals all equipment that can be dismantled or removed for inspection and repair in shops. This will both insure quality in inspection and repair and will also reduce adverse effects on transportation. There should be a change away from a decentralization of repairs to centralization of repairs, i.e., for the installation of equipment on the road that cannot be moved, a special corps should concentrate the needed manpower and material resources to make concerted repairs in order to raise to the full the quality of equipment in use. Equipment in the same system that is repaired at different sites and at different times should be repaired in a phased system to increase the quality of equipment in use throughout the whole system. Electrical testing should be increased and a special testing corps set up for gradual development of controlled preventive repairs to produce a benign cycle of equipment maintenance.

For day-to-day maintenance work, a system should be instituted of daily checks, monthly inspections, seasonal inspections and repairs, and annual overhauls, with everything possible being done to reduce the conventional metering times so as to reduce the impact of human error and key operating areas on transportation.

Everything possible should be done in busy transportation zones to avoid using intervals between trains to inspect and repair. Instead, the following method should be employed: Full use on electrified sections of "skylight" periods to make repairs. In hump yards, inspection and repairs may be made during halts when shifts change at stations. At large stations, every effort should be made to include electrical inspections and repairs in daily operating plans, effecting repairs at planned times. Large operations should be made a part of monthly branch bureau transportation plans, operations being suspended according to plan.

Promotion of maintenance reforms requires corresponding changes in the organization of maintenance, with the establishment and bolstering of various kinds of inspection and repair bases and repair teams. It must be realized that until such time as there has been marked improvement in the reliability of equipment, intensification of the building of bases will remain extremely necessary. In this regard, the following is required:

1. A full complement of personnel at inspection and repair bases, giving special attention to having technical personnel on hand.

2. Perfection of the management system to do a good job of quality inspection on equipment leaving the shop to reduce the frequency of returns for repairs.

3. Conscientious adoption of advanced inspection and repair techniques and promotion of advanced operating methods.

4. Improvement of required inspection techniques to improve quality of inspection and repairs.

5. It is necessary to make full use of a large body of accumulated rotational repair data and to conduct needed checks on how equipment is used, scientifically determining the repair cycle that should be used for various kinds of equipment. Once the inspection and repair cycle for all kinds of equipment has been set by the railroad bureaus, it is to be carried out by bureaus, suiting general methods to specific circumstances.

We must also strive to develop the purview of micro-computer testing technology so that major pieces of equipment are controlled by micro-computer processing systems for automatic records keeping, automatic testing, and giving warning of troubles. This is the way to bring about controlled preventive repairs or in-service repairs to attain the goal of little or no maintenance.

4. Carry Forward a Spirit of Seeking Truth in Facts and Do a Solid Job of Safety in Production

Safety in production is the overall embodiment of the quality of work of all railroad departments, all individual jobs and the work of each and every staff member and worker on the railroad. Practice has demonstrated that good performance of safety in production entails tackling problems in an overall way, i.e., being guided by thinking in which rigorousness is first, using high standards to require education in safety, firmly establishing a psychology of safety first, and strictly carrying into effect every effective rule and regulation on safety in production, halting violations in operations and persevering in unflaggingly giving attention to work at the grassroots. A solid job must be done on all basic work and the bolstering of scientific management. Advanced technical equipment that insures transportation safety should be widely adopted as a means of gaining consistent results over a long period of time.

Two matters should be given attention for safety in production at the present time:

(1) Adherence to the Party's spirit of seeking truth in facts, correcting unhealthy tendencies toward resorting to deception about safety in production.

The Ministry of Railways' Party organization enlarged conference pointed out that "real efforts must be devoted to safety in production with no resorting to trickery. Correct handling of the relationship between safety and efficiency requires constant improvement in relevant safety examination criteria and methods of meting out rewards and punishments." This view is completely consistent with the present state of safety in production in the electrical system of the Ministry of Railways. Consequently, those methods of checking that do not advance the development of productivity but rather hamper the development of production have to be abolished. The goal of the electrical system should be no occurrence of major accidents or dangerous accidents. For minor accidents, the general accident rate should be used as the indicator for how good safety is. Furthermore, every effort should be made to get rid of a large number of ways of doing thingsthat cause accidents involving penalties. Only by so doing can the real situation be reflected. This holds numerous advantages and no disadvantages.

(2) Adherence to the Concept of Service to Transportation Safety

The more advanced the performance of electrical equipment, the higher its safety performance and the more completely it is interlocked. Then accidents for which electrical departments are responsible decrease greatly or do not occur. This has been a pattern demonstrated in practice. We have analyzed major train accidents that have taken place in the rolling stock system during the past several years, finding that 50 percent of them occurred in non-marshaling interlocked train stations and 17 percent of them occurred in electric marshaling station non-interlocked areas and during periods when signaling equipment was not in use. Sixty-seven percent of accidents occurred under these circumstances. Since the end of the 1960's, an average of 2,000 switches have been installed at 100 stations each year on electric marshaling stations on all lines, yet major accidents on all roads in recent years have declined by an average 55 per year.

However, as far as electrical departments are concerned, the more complete and the more advanced the functioning of electrical equipment, the more complex the equipment and the greater the number of parts used, meaning the greater the opportunities for accidents to occur and the greater the possibility for the occurrence of minor accidents. During the 1950's, for example, minor accidents numbered 500 per year; during the 1960's, the average was 1,200, and during the 1970's it was 1,700. So far in the 1980's, it has been 2,300. Therefore, advanced electrical equipment has meant that electrical staff members and workers have not only had to do more maintenance work, but they have also had to bear greater risks. It has been worth it, however. The large increase in minor accidents in the electrical system has brought a trade-off in much much fewer major accidents. This demonstrates that taking on heavier burdens and facing greater risks for the overall benefit of transportation is a necessary duty.

5. Thoroughgoing Promotion of All-around Quality Control and Intensification of Staff Member and Worker Technical Training

(1) It was in 1979 that electrical departments launched an all-out campaign for quality control. After 6 years of unflagging efforts in general education, training of permanent cadres, the running of pilot projects, critiquing and exchanging experiences, this method of scientific control has penetrated through all links of electrical management. A substantial number of electrical sections have become a part of regular control channels and have played an outstanding role in improving enterprise quality, in improving enterprise management, and in solving key problems in production technology. For some time to come, the requirements for all-around quality control will be as follows:

1. All-around examination and critiquing of major experiences during the past several years in comprehensive quality control work, focusing on existing problems, and formulating actions for improvement.

2. Further bolstering of basic work in quality control in conjunction with the reform of enterprises that is underway for good performance in the scientific management of enterprises.

3. Leaders at all levels should be concerned with quality control team activities, strengthening leadership, and specific guidance to quality control teams as well as providing them with necessary working conditions.

4. Pursuit of a policy of emphasis on education first and last, continuing to expand basic information about comprehensive quality control, and education in basic methods and the various tools to be used for a further rise in consciousness about and work methods for quality control.

(2) Good performance in technical and vocational training to accelerate the training of skilled people. As science and technology advances, the updating of electrical equipment becomes faster and faster. Consequently, an overwhelming majority of people including cadres, engineers and technicians, and workers have to study and update their knowledge constantly.

The country requires that workers and beginning level technical brush-up courses be used as a basis for higher levels to get workers started on middle level technical training. The electrical system has to coordinate actively with educational departments in carrying out this task. Right now, it is necessary to begin to formulate and publish relevant teaching outlines and specialized training materials and to formulate various professional standards so as gradually to begin professional training in various fields. This is a painstaking task that requires pilot projects and the critiquing of experiences with them. Only through persistence in the education of staff members and workers can results be obtained. Investment in intellect is a project of vital and lasting importance. We must not miss any opportunities to persevere in the education of staff members and workers.

6. Take Firm Grip on Management of Overhauls To Get the Most from Investment

Major electrical overhaul work has scored very great achievements in recent years. It has concentrated the funds necessary for improving transportation capacity to carry out a technical transformation of bottlenecks on several major trunklines. Nevertheless, major electrical overhauls remain a weak link in electrical work. (1) Since funds for major overhauls are insufficient, it is impossible to guarantee that the cycle for major overhauls of electrical equipment will be adhered to. This means that electrical equipment has to remain in service longer than it should, producing a vicious cycle in which capital is consumed. (2) Dispersal of funds for major electrical repairs is a serious problem, making it impossible for a technical transformation section by section to form a network through major overhauls, as a result of which benefits from investment are not high. We believe that it would be more advantageous for railroad bureaus to make unified plans on a bureau-wide scale for large scale major electrical overhauls. (3) In the realm of the management system, the body of manpower for major overhauls is fairly dispersed; capabilities are mutually canceling, and work periods are very drawn out. Though there should be no forced uniformity in the management system at the present time, at least each bureau should maintain a competent corps for planning and carrying out major electrical overhauls, major repairs of electrical equipment thereby having some reliable assurance of being done. In addition, electrical departments should unify information about major overall projects in their own bureau. Each electrical office should designate a functional office and designate personnel for major overhaul projects, regularly collecting and reporting to higher authority project status reports.

Ideas For the Future

(1) The ministry's major communications project during the Seventh Five-Year Plan is to open a network on the Beijing-Guangzhou and the Longhai trunklines, and to make major improvements on the communications lines on the Beijing-Zhengzhou and the Wuhan-Hengyang lines in order to solve the problem of serious overloading of circuits on the Beijing-Guangzhou line. On the Zhengzhou-Baoji section, in addition to the electrification project presently under consideration, investment in major overhaul will open 960 circuits to solve the overloading of circuits on the western part of the Longhai Line. The emphasis on the northern trunkline network is on the Jining-Hohhot Line; in the southwest it is on the Daxian-Chongqing Line; in the northwest, it on on the Hami-Urumqi Line; and in the northeast it is on the Harbin-Qiqihaer and the Changchun-Jilin Line, all of which would have communications open for use as quickly as possible.

(2) In 1986, a major overhaul to update signals will focus on finishing up a major overhaul of automatic blocking between Shenyang and Changchun; on an automatic blocking project between Wuhan and Hengyang; on completion of a project to improve automatic blocking between Tianjin and Shanhaiguan; and on beginning work on the construction and improvement of automatic blocking between Shenyang and Shanhaiguan, and between Shenyang and Dalian. Acting in accordance with the principle of trunklines first and spur lines second, passengers first and freight second, the work of installing locomotive signals will focus this year on trunkline additions. On sections where locomotive warning equipment has already been installed, second warning points will be installed. On sections where old style dual frequency point warnings have been installed, updating to new dual frequency point locomotive signaling equipment will be done. Installation of signals at level crossings will focus first on level crossings on international train trunklines and on 15 major trunklines.

(3) In order to insure progress on key projects, it is recommended that funds for locomotive signals, level crossing signals and on-board radios on locomotives be included in railway bureau and branch bureau funds to insure that work is done.

(4) Strive for effectiveness and strive for quality and practice the letting of bids for project construction and give priority in the letting of bids to construction units that produce good quality, enjoy a high reputation, and

charge fair prices to encourage competition and to advance progress on projects for early service and early benefits.

7. Good Performance in Scientific and Technical Planning for Active Promotion of Progress in Electrical Technology

The work of electrical departments must explicitly adhere to reliance on scientific and technical progress to develop ideas and concepts for electrical matters in accordance with specific policies and requirements from the State Council regarding technical progress in enterprises, as well as the principles laid down in "Major Technical Policies For Railroads" in conjunction with the basic tasks for railroad work set by the Ministry of Railways Party organization. In the future, "CPC Central Committee Decisions on Reform of the Scientific and Technological System" will have to be carried out in the performance of electrical work, with further adherence to its statement that "a change is needed in technical development work, with imported technology placed in an important position for the development of production techniques and the transformation of existing enterprises." It will also be necessary to act in the spirit that "research and development work in China should be closely linked to imported technology and advanced technology digested and absorbed in order to raise the starting point for development of production techniques and going on to develop new innovations and increase capabilities for developing techniques on our own," with electrical departments doing a good job of importing, digesting, developing and innovating. At the same time, it will be necessary to eradicate further conservative ideas of following beaten paths and standing pat. It will also be necessary to overcome blindness in the importation of technology and correctly handle the relationship between the importation of equipment and the importation of technology, the relationship between the importation of technology and scientific research being conducted on problems in China, and the cooperative relationship between the imported technology and the division of labor for production within the country and within regions. Thus, overall planning that takes all factors into account is required, using unified policies and standards. This is particularly important for technology and equipment that has a bearing on whole projects and whole networks, and serious attention must be directed to this point. In addition, in the realm of the development of new technology, we believe in the advocacy of letting a hundred flowers blossom and a hundred schools of thought contend, weeding through the old to bring forth the new, and supporting pilot projects. However, in the spread of technology, unified research and strict mastery are necessary with no going off in all directions. It must benefit unified management, mutual dovetailing and integration into a totality to help development.

TRANSPORTATION

RAILWAY IMPROVEMENT PLANS LAID OUT FOR NEXT 5 YEARS

Hong Kong LIAOWANG OVERSEAS EDITION in Chinese No 12, 24 Mar 86 pp 16-17

[Article by Wang Ruozhu [3769 5387 4554]: "Improve 10,000 Li of Rail Transit Lines"]

[Text] In the next 5 years, China will build 3,500 km of railways and increase electric railways by 4,600 km and multiple-track railways by 2,900 km.

Strategic Plans for Railway Development

The Chinese government recently decided that the development of national communications and transportation should still focus on railway transportation. Not long ago, railway experts met in Beijing to study the trend of development of China's railways in the next few years and discussed plans for the next 5 years.

China's railways are concentrated in eastern areas and scattered in western areas. This is a result of Chinese history and economic development in the last century. Currently China has 52,000 km of operational railways, including 14,000 km of electric and diesel lines. In 1985 the freight volume of China's railways was supposed to reach 1.27 billion tons, passenger volume 1.11 billion people, and freight and passenger turnover 1,030 billion converted ton/km. Since China's railways did not go through a period of history in which communications and transportation industries developed by leaps and bounds as in the Western countries, the growth of railway transport capacity has always lagged behind the need of the national economy, forcing many regions and production departments to make production and marketing plans according to transport capacity, thus limiting the speed of economic development.

The experts held that in order to bring about a fundamental change in the passive situation of railway transport, by the end of this century the freight and passenger turnover of China's railways should reach 2,800 billion converted ton/km and operational railways should reach about 75,000 km including 35,000 km of electric and diesel railways which will account for half of the total rail mileage and handle over 80 percent of the total freight and passenger turnover. Large national marshalling grounds should basically realize automation or semi-automation. All busy trunk lines should have heavy seamless steel tracks and modernized dispatch and control systems.

To reach this goal, the general strategy should be carried out in two steps: 1) Improve and transform busy trunk lines in the eastern area, vigorously transform the rolling stock industry and alleviate the shortage of railway transportation; 2) vigorously adopt new technology and equipment in the last 10 years of this century to transform railways and extend the railway network to suit the needs of economic development.

Improve and Transform 10,000 Li of Railway Lines

The experts pointed out that by the year 1990, railway freight volume will reach 1.6 billion tons, of which 650 million tons will be coal transport which affects the national economy as a whole. The volume of coal transported from Shanxi to other parts of China will amount to 210 million tons. Railway passenger volume will reach 1.4 billion people by 1990. This requires that in the next 5 years we build 3,500 km of new railway lines, of which 13 railways totaling 1,800 km will be built by joint ventures, and we must increase electric railways by 4,600 km and multiple-track railways by 2,900 km. To reach this goal, the Ministry of Railways pointed out the need to concentrate efforts on the following two areas:

A. Improve and transform 16,000 km of busy trunk lines in northeast China and along the east coast, increase comprehensive transport capacity by a wide margin, and ensure that transport needs are met basically.

Northeast China and the east coast comprise a third of China's territory, their population accounts for a half of the nation's total, and their total industrial and agricultural output value accounts for 70 percent of the national figure. They are the economic lifelines of China. Railway transport conditions in these areas have a direct bearing on China's economic growth and take off. Across the vast territory of China run 14 major railway trunk lines which form a rail network consisting of six vertical lines (Hada, Jingshen, Jinghuhang, Jingguang, North and South Tongpu, and Taiyuan-Jiaozuo-Liuzhou) and eight horizontal lines (Binsui, Jingbao and Jingqin, Shitai and Shide, Jiaoji, Longhai, Zhegan, Jiaozuo-Xinxiang, and Yanzhou-Shijiushuo and Daqin which is under construction). The total length of these 14 trunk lines account for 30 percent of China's operational railways, but their freight turnover volume accounts approximately for 70 percent. Therefore, once these 16,000 km of railways are transformed, China will be able to gain the initiative in transportation as a whole and yield maximum social results.

In the next 5 years in Northeast China and the east coast, China will lay 2,500 km of multiple-track railways, increasing the rate of multiple tracks to 70 percent, rebuild and expand 7 key marshalling grounds, build 2 new marshalling grounds at Hada Village of Harbin and Jiang Village of Guangzhou, build and expand 10 large passenger stations (at Shanghai, Tianjin, Shenyang, Xuzhou, Hankou, Shijiazhuang, Zhuzhou, Jinan, and Yongdingmen and Xizhimen of Beijing), lay nearly 10,000 km of 60-kg heavy tracks, use computers in operations and controls, and develop a series of new technology and equipment systems such as optical fiber communications. By 1990, the 16,000 km of railways in northeast China and the east coast will look as good as new.

B. Vigorously transform the rolling stock industry, substantially increase production capacity and improve product quality, update locomotives, and enter the age of electric and diesel hauling. By the year 1990, China should be self-sufficient in rolling stock and satisfy the needs of transportation.

Judged from the current situation, the rolling stock industry is the most prominent weak link in the railway department. It has become a major element that prevents railways from making fast growth. Because of this, the amount of investment the railway department is planning to make in the next 5 years is equivalent to the total amount of investment made in the last 35 years, since the founding of the PRC. Comparing 1990 with 1985, the production capacity of electric and deisel locomotives will increase 1.5-fold, that of freight cars 70 percent and that of passenger cars 1.2-fold. By 1990, a powerful rolling stock production system with all-round development of passenger, freight, and switching locomotives, coordinated high, medium and low power levels, and compatible passenger and freight cars will begin to take shape.

In the next 5 years, the railway department will carry out the mass production of such new products as Shaoshan model No 4 electric locomotives, Dongfeng model No 8, 7, and 5 diesel lomotives, 25.5 meter passenger cars, and C61 short freight cars. In addition, it will import from the United States the manufacturing technology of major parts of diesel locomotives to improve the performance of Dongfeng model No 4 diesel locomotives; cooperate with the Likaduo [6849 0595 1122] company of England in improving the diesel engine of diesel locomotives to increase drawing power; import from the Alsthom company of France the manufacturing technology of major parts of electric locomotives to produce new-style electric locomotives; cooperate with British experts in improving the advance-type steam locomotives to increase heat efficiency; and use the World Bank's loans to transform the Zhuzhou Electric Locomotive Plant and the Changchun Passenger Car Plant. At the same time, it will also rebuild and expand nine rolling stock repair plants, build one or two new repair plants, improve repair techniques and quality, and greatly increase the production capacity of spare parts and rolling stock.

Expand Transport Capacity

In 1986, the railway department will strive to increase the weight of trains, vigorously organize combined trains with heavy loading capacity, and enable major lines such as the Fengtai-Shacheng-Datong, the Beijing-Qinhuangdao, and the Beijing-Shanghai to increase their hauling capacity to 3,700 to 4,000 tons. At the same time, it will strengthen joint transport by railways, highways, and waterways and vigorously develop modernized container transport. In 1986, the railway department will continue to increase the number of passenger trains. On 15 trunk lines, including the Beijing-Guangzhou, the Beijing-Harbin, and the Beijing-Shanghai lines, the number of express and through trains will be increased from 12 pairs to 20 and that of passenger trains from 8 pairs to 17. Beginning 1 April 1986, the two pairs of express trains running between Beijing and Shanghai will reduce their running time from the current 19 hours to less than 17 hours.

With regard to capital construction, main tasks for 1986 are to tackle the multiple tracks between Hengyang and Guangzhou in the south and the new line between Dalian and Qinhuangdao in the north, formulate policies for improving and transforming the 16,000 km of busy trunk lines, continue to carry out the construction of the two transfer port stations of Erlian and Manzhouli and the construction of the Guangshen Railway, increase import and export capacity, and speed up the construction of such port stations such as Dalian, Qingdao, and Lianyun harbor.

WUHAN AIRLINES OPERATIONS--Wuhan, 13 May (XINHUA)--China's fifth local airline, Wuhan Airlines, run by authorities in this capital of Hubei Province, central China, was launched yesterday. The company will run scheduled passenger flights and tourist flights, as well as air freight services for agriculture and industry in Hubei, Hunan, Guangdong and Sichuan provinces. Other local Chinese airlines are run by authorities in Shanghai, Xiamen, Heilongjiang and Kunming. [Text] [Beijing XINHUA in English 1343 GMT 13 May 86 OW] /12858

INTERNATIONAL FLIGHTS TO URUMQI--Urumqi, 17 May (XINHUA)--Beginning as of tomorrow, planes flying the Beijing-Karachi (Pakistan) and Beijing-Addis Ababa (Ethiopia) routes will make one landing every two weeks at the Urumqi Airport on their return flights, local officials said here today. The airport is one of China's five major international airports. The other four are Beijing, Shanghai, Guangzhou and Kunming airports. [Text] [Beijing XINHUA in English 1527 GMT 17 May 86 OW] /12858

USSR URGES ENTERPRISES TO CHANGE METHODS

OW281854 Beijing XINHUA in English 1845 GMT 28 Apr 86

[Text] Moscow, 28 April (XINHUA)--The Soviet Union is switching to a large number of its industrial enterprises to new management methods, the communist party newspaper PRAVDA reported today.

The paper said bold new methods--including genuine cost accounting, self-support, self-financing and the linking of wages to production levels--are what the Soviet economy needs.

The changes are viewed here as practical steps in the wake of the Soviet Communist Party's 27th Congress, which decided the country's sluggish economy should be improved by introducing economic reforms.

In its lead story "developing a more efficient mechanism of management," PRAVDA said that "enterprises and organizations of over 100 union and republican ministries and departments are being switched to new modernized methods of management this year."

The newspaper maintained that "constantly upgrading and perfecting in every way new methods of management enables the country to reveal new reserves of the socialist planned economy and will become a powerful impetus to expediting the country's economic development."

Observers here say that many enterprises have already achieved good results by using new management methods. For example, the country's industrial output during the first quarter of this year was 6.7 percent higher than that during the same period of 1985, and labor productivity for the same period was 6.3 percent greater.

PRAVDA also criticized several departments, including central bodies, for hanging on to old methods, saying the time when every enterprise is determined to make full use of its own potentials and funds to improve production is still a long way off.

PRAVDA also stressed the need to put the most emphasis on refitting existing industrial enterprises with technologically advanced equipment.

POLISH STATE ENTERPRISE DECLARED BANKRUPT

OW040805 Beijing XINHUA in English 0746 GMT 4 A pr 86

[Text] Warsaw, 3 April (XINHUA)--A provincial court in Katowice, Poland declared recently that a state-run enterprise, "Domgos" Metalware Factory, in Zabrze City, had gone bankrupt, local papers reported today.

This is the thrid state-run enterprise declared bankrupt since the "act on the improvement of work of state-run enterprises and bankruptcy" went into effect on 1 October 1983, the papers said.

Built in the mid-70s, "Domgos" is a factory specializing in making metal goods for daily use. However, despite the "not small investments" and "very advanced" equipment, the factory with 130 employees went from bad to worse in the past years. In 1984, its production declined by about 20 percent over the previous year and in 1985, there was another 5-percent drop over 1984. By the end of last year, it had contracted a debt totaling 41.7 million zloty (about 280,000 U.S. dollars).

This is not surprising, the papers said, because the plan to build this factory itself was not "realistic." The supply of materials such as steel plates and steel tubes, for instance, was not ensured from the very beginning. Meanwhile, the wages of employees kept on increasing. All this inevitably led the factory going deeper and deeper into debt, and finally brought it to court. The court, under the demand of the suitor, the minister of metallurgical and machinery industry, and in accordance with the "act on the improvement of work of state-run enterprises and bankruptcy," pronounced the factory bankrupt.

Under the act, an enterprise should, when it goes into the red, first work out a "revival plan" to improve itself. If the plan fails, responsible leading departments should conduct "commissionary management" of the enterprise by sending inspecting teams into it. If "commissionary management" still fails, legal means have to be used.

The "act on the improvement of work of state-run enterprises and bankruptcy," it is reported, has indeed helped enterprises in improving their management. By the end of 1984, there were 1108 "poorly-managed" enterprises in Poland. But by the beginning of this year, the number had been reportedly reduced to 830. Among them, about 160 are taking the "revival plan" while 32 others are under "commissionary management."

CHINESE MEDIA ON FOREIGN ECONOMIC AFFAIRS

BRIEFS

XINHUA NOTES PRAVDA ITEM--Moscow, 12 May (XINHUA)--The Soviet party daily PRAVDA today called for an active struggle against what it termed "parasitic tendencies" in the nationwide reform. In a leading article, the paper said some people, including senior officials, accept the need of reform in words but act against it. Being fond of empty talks over the reform, a matter of vital importance for the country, they try to adapt themselves to new ideas without changing anything in practice, PRAVDA added. However, the paper said, reform "is in progress, people's attitude towards work is changing, and this cannot be reversed." Emphasizing that reform, now under way in the light of the decisions of the party 27th Congress in early March, "requires purposeful actions from all and from each," the party daily underlined the need to carry out an active struggle against parasitic tendencies of whatever forms. PRAVDA has recently published letters from its readers complaining about the lack of significant changes in the work of many departments since the 27th Party Congress. JOINT STOCK EXCHANGE OFFICIALLY OPENS

Hong Kong CHING-CHI TAO-PAO in Chinese No 12, 31 Mar 86 pp 7-8

[Article by staff reporter Gu Wen [0657 2429]: "A New Page for Hong Kong's Stock Exchange--From Four Stock Exchanges to a Joint One"]

[Text] For Hong Kong's stock market, 2 April 1986 was a historic day. After a decade of efforts, the Hong Kong Joint Stock Exchange has finally opened officially. The four divisions of Hong Kong's stock market are now history.

The Hong Kong Joint Stock Exchange is the merger of the Hong Kong Stock Exchange, the Far East Stock Exchange, the Kam Ngam Stock Exchange and the Kowloon Stock Exchange. The merger of these four stock exchanges underwent a very long process of exploration and study. As early as the 1970's, Hong Kong authorities already had the intention to integrate the four stock exchanges but they could not reach consensus until they went through all kinds of difficulties and it was not until July 1980 that the "Bill of 1981 on the Merger of Stock Exchanges" was officially published in the SANG PO. The main objective of this bill is to stipulate the establishment of an integrated stock exchange in Hong Kong. However, because the bill touched upon the restrictions on the membership requirements, it was strongly criticized by some people from the securities field. In view of this, the Hong Kong government revised part of the content after consulting with the people from all circles, went through legislative procedures, and put the bill into effect beginning 1 January 1981.

Implement Various Change Measures

The establishment of the Hong Kong Joint Stock Exchange was not a simple process of eliminating four mountain strongholds, disbanding four stock exchanges, and making a fresh start. Instead, it was executed along with the unification of stock exchange systems, the development of computerization, and the revision of marketing and stock exchange regulations. Therefore, we may say that the opening of the joint stock exchange is in fact a change for Hong Kong's stock market.

After opening, the joint exchange will have the following innovations:

1. Markets and regulations unified. As the joint exchange starts business, Hong Kong's stock markets, which were originally scattered in four different places of Hong Kong and Kowloon, will be concentrated in the exchange square where the joint stock exchange is located whereas the administrative organs, administrative systems, membership requirements, exchange regulations, and stock prices of the stock exchange will be changed from separated and different operations to totally unified ones.

2. The auction system discarded and transanction procedures computerized. As the joint exchange starts business, the present public bidding system will become history and be replaced by a computerized exchange system which consists of nine sets of Tandem Nonstop 2 computers and 800 sets of specially-designed dual-purpose terminals. The terminals which are on-line with the computers are placed along the walls of the hall. A four-way display board is hung from the ceiling in the center of the hall showing the buying and selling situation of most active stocks. In addition, the joint exchange also has a computer specifically designed to provide exchange information for the outside.

3. Membership foundation expanded and brokers' quality improved. After the joint exchange was established, all members of the original four exchanges were admitted to the memberships of the joint exchange. It is estimated that when the joint exchange begins operations, over 670 out of the original 960 members will continue to do business. The biggest change is that according to the new rules of the stock exchange, membership is no longer limited to individuals. It is expanded to include individuals and companies. Under the new rules, bank brokers, brokers linked to banks, and foreign securities dealers are all allowed to become members of the stock exchange. At the same time, the securities supervision and control department and the stock exchange have drawn up stricter standards for membership examination and approval, including one that requires brokers to have 3 years of experience in the securities field or pass an examination to obtain the credentials approved by the stock exchange.

4. The supervision and control of marketing companies increased and plans to relax restrictions on marketing requirements. According to the securities regulations of 1986 (for securities to be marketed at the stock exchange) which were officially put into effect on 1 February, the securities supervision and control department has been vested with greater powers, including ones to call for the suspension of a company's buying and selling and disqualify marketing companies. In addition, the new regulations also stipulate that marketing companies disclose more detailed information such as financial situation and major transactions. While strengthening supervision and control, the stock exchange also plans to relax restrictions on maketing conditions later. One of its plans is to do away with the restriction that companies offering to list their stocks with the exchange should be in business for 5 years and the restriction on the amount of dividends. Another one is to establish the second market and attract foreign companies to list their stocks in Hong Kong.

5. The compensation system improved and compensation ability increased. The joint stock exchange stipulates that every member must pay 50,000 yuan in cash to be used as the compensation fund. According to another plan, every member should pay another 500,000 yuan of security deposit to meet the needs of brokerage firms for compensation.

Accelerate the Development of Stock Market

Since the merger of four exchanges into one was executed along with various changes, the opening of the joint exchange will not be merely a formality. Judged from the current situation, it apparently is a force that will give further impetus to the development of Hong Kong's stock market whereas its main role is to increase the degree of internationalization of Hong Kong's stock market and improve its financing and investment functions.

Hong Kong is known as the third biggest financial center of the world. Judged from the number of banking institutions, the volume of international banking operations, gold transactions, and fund control, Hong Kong deserves this title. However, Hong Kong's stock market lags far behind other international financial centers. Among the original four stock exchanges, only the Hong Kong Stock Exchange joined the International Stock Market Association and only as an affiliated member. Although Hong Kong's stock market has been operating for over 90 years, Hong Kong's listed stocks are still not considered as negotiable securities in Europe. One of the reason for such a phenomenon is the disunity of stock exchanges and the outdatedness of the exchange system. Now that the four exchanges have been merged into one and the exchange system improved, the joint exchange has more favorable conditions for joining the international circle of stock exchanges. We may assume that in the near future, the joint stock exchange will be accepted by the International Stock Market Association as a formal member. If the plan to attract foreign companies to list their stocks in Hong Kong is realized, Hong Kong's stock market and stocks will be better known internationally and have a higher reputation.

The most important function of the stock market is to provide, on the one hand, financing opportunities for industrial and commercial enterprises to expand business and, on the other hand, investment instruments for investors. These two functions supplement each other. We should affirm that Hong Kong's stock market does have some functions but there is much to be desired. For instance, the number and amount of new issues of stocks listed in the past few years have been obviously reduced compared to the past. For another instance, although the indexes of stock market have repeatedly increased in the past 2 years, the volume of transactions has not been significant. For still another instance, although Hong Kong is the fund management center of Asian and Pacific areas, none of the funds under the management of Hong Kong considers Hong Kong as the main target of investment. The main cause for this situation is that investors do not quite trust investment in Hong Kong's stock market. The main problems are overly relaxed supervision and control of marketing companies, limited disclosure of information on marketing companies, common insider trades in the stock market which are likely to cause investors to be ripped off or even lose their principal and uneven qualifications of stock brokers. Judged from the situation as a whole, there are such problems as insufficient strength and limited relations. Now we may say that after this change, all of the abovementioned problems can be at least alleviated. Since measures to strengthen the supervision and control of marketing companies, improve the quality of stock brokers, and improve the compensation system will play an role in perfecting Hong Kong's stock market as a whole and ensuring the interests of investors, it is certain that they will also make Hong Kong's stock market more appealing to investors. The admission of bank brokers and foreign securities firms to the membership of the joint stock exchange actually adds to Hong Kong's stock market a brokerage force of a great scale or with a huge network of clients. This, however, will increase pressure on original brokers but will facilitate the stock investment of local investors and absorb more foreign capital into Hong Kong's stock market. As more capital is invested in the stock market, the financing function of the stock market will of course be increased.

SMALL, MEDIUM-SIZE BANKS FORCED TO MAKE CHANGES

Hong Kong TA KUNG PAO in Chinese 29 Mar 86 p 4

[Article by reporter Lei Jingbin [7191 0352 2430]: "Small and Medium-size Banks Are Forced To Make Changes"]

[Text] The repercussions of Hong Kong banking unrest brought about by the Hong Kong government's takeover of the Hang Lung Bank in September 1983 in an emergency move are still being felt. On Thursday, the banking commissioner asked Jardine Fleming to take over the operations of the Union Bank. The Hong Kong government has now used the foreign exchange fund successively on four occasions to rescue banks in different kinds of trouble. Consequently as many as five banks are either directly and indirectly supported by the Hong Kong Government.

Two Diametrically Different Problems

In spite of the fact that these incidents that rocked Hong Kong's financial world occurred one after the other in less than 3 years, the incidents involving Hang Lung Bank, the Overseas Trust Bank, and the Hong Kong Industrial and Commercial Bank, on the one hand, and the Ka Wah Bank and the Union Bank, on the other hand, recently reflected two diametrically different problems in Hong Kong's banking circles.

An analysis of the crises involving the Hang Lung Bank and the Overseas Trust Bank shows that there are three contributing factors: 1) The sudden changes and sharp deterioration of the political and economic situation in Hong Kong; 2) poor internal management and operations; 3) involvement in certain criminal acts in business. With regard to the incidents that involved the Ka Wah Bank and the Union Bank recently, even though these two banks may appear to have management and operational troubles, it was neither sudden economic changes nor unlawful acts that brought troubles on them.

It is undeniable that the raging tides in real estate business from 1978 to 1981, the test of confidence and the real estate slump between 1982 and 1984, and the fierce competition within banking circles have an impact on every bank in Hong Kong today and only the degree of impact varied in different places. As to whether or not the reserves of bank assets are sufficient to cope with such an impact, considering that both large, medium, and small banks have bad debts, the degree of the impact being felt by large banks is relatively insignificant because of their solid strength and greater assimilating capacity, on the other hand, the degree of the impact being felt by the medium and small banks is much greater and the period of assimilation longer due to their scale.

Differences Between Large Banks and Medium and Small Banks

It is a pity that before the medium and small banks could completely free themselves from the impact that lasted from 1982 to 1984, the Hang Lung Bank and the Overseas Trust Bank incidents surfaced one after another. The depositors, in general wary of the medium and small banks, have been unwittingly transferring their deposits from medium and small banks to large banks. People in banking circles called this kind of slow slipping away of deposits and "intangible run on bank deposits." Although in practice it is vastly different from a run on a bank like a swarm of bees that closes down a bank instantaneously, it does produce the same result of depleting large amounts of bank deposits and creating a shortage in circulating funds.

Moreover, the medium and small banks are also plagued with some perennial problems, such as high cost in handling deposits and their limited ability to provide credit for customers. The so-called high cost for handling deposits means that the medium and small banks often have to negotiate short-term loans on a daily interest rate with their counterparts in order to cope with the withdrawing of cash by their customers, thus making the cost of handling deposits higher than the large banks. The medium and small banks, on the other hand, limited by their small scale naturally cannot meet the demands of big customers nor can they participate in any way in the enormous loans involving banking groups.

Suggestions for Rescuing the Banking Business

Many advocates have come up with numerous measures for rescuing the banking business in Hong Kong in the light of prevailing problems: 1) Setting up a deposits insurance system; 2) forming a contingency banking group by large banks; 3) establishing a discount window. The above-mentioned measures actually can only help medium and small banks experiencing difficulties in short-term turnover. For example, when the Ka Wah was threatened by rumors last year, the Bank of China formed a contingency banking group in conjunction with the Hong Kong and Shanghai Banking Corp. and openly declared that the Ka Wah Bank would be amply covered by a contingency loan. However, such an interim contingency measure failed to basically extricate the Ka Wah Bank from its predicament.

Other people have also made suggestions that the medium and small banks should go into operations to confront the large banks. However, there are only two forms of joint operations: 1. Those of a technical nature, such as the services being provided by the automatic deposit withdrawing machine. But this type of technical joint operations does not help solve the problems the medium and small banks now face other than giving them a better image. 2. The other is a genuine joint operation by supporting each other in circulating funds when needed. Theoretically speaking, this type of joint operation is very simple, but in actual practice, it is a complicated matter dealing with banking secrets, personnel management, and so forth. So unless banks are under the control of the same group, a genuine joint operation is impossible.

The term "bank mergers" coined by people in banking circles means that the medium and small banks are being taken over by large banks or they are forced to seek strong and powerful partners. This has become a most common trend in bailing out medium and small banks in trouble today. A case in point for example, is that the Hang Seng Bank became a shareholder of Wing On Bank, Chma Trust and Investment Corporation, injected capital into the Ka Wah Bank, and the Union Bank which ran into trouble recently also hoped to find a partner. Under these circumstances, few medium and small banks in Hong Kong today are still fully independent!

The Issue of Medium and Small Banks Being Merged

In the foreseeable future the reorganization of the independent medium and small banks remaining in Hong Kong will be accelerated and that it is a general trend that they will be taken over by large banks or drawn into partnership with powerful foreign capital interests. As a matter of fact, so long as the change is developed normally and healthily, it will not adversely affect Hong Kong's role as a financial center.

With the medium and small banks completely "rejoining" the ranks, the unrest in Hong Kong banking circles since September 1983 should come to an end. By then perhaps only a few large local banks and a certain number of foreign-capital banks will remain in Hong Kong banking business. The foreign-capital banks in Hong Kong have not been too keen about serving local banks all along, in other words, the local banking services in the future may be monopolized mainly by a handful of local banks.

As competition diminishes, it is quite likely that the efficiency of banking services may drop and bank customers may be charged for services rendered. It remains to be seen whether or not fees charged gradually by the banks to customers for certain services rendered represent the trend of development of the above-mentioned situations.

GOVERNMENT TAKES ACTION TO SAVE TROUBLED BANKS

Hong Kong MING PAO in Chinese 2 Apr 86 p 2

[Article: "Financial Secretary Explains: Using Surplus Foreign Exchange Fund To Save Banks in Trouble Is To Preserve the Confidence of Hong Kong and Foreign Depositors"]

[Text] The Financial Secretary SirJohn Bremridge explained his action of using foreign exchange fund to save banks in trouble. He indicated that the concern of the Hong Kong government is to make Hong Kong become a place where Hong Kong and foreign depositors feel at ease with their investment.

He said: The regulations for foreign exchange funds give the department of finance some power that can be exercised in due time. The regulations of banking institutions also give bank supervisors and managers some power that can be exercised immediately. Therefore, had we sat by and watched banks closing down and ignored the resulting runs on many other banks, we should have been blamed. The exercise of relevant powers should not wait for the debate of the legislative bureau, which should focus on preventing problems.

The foreign exchange fund has been used on many occasions in the past to support banks in trouble. The actual amount of funds used was within the limit of increases in the balance of the fund.

The financial secretary explained that he had not planned to answer questions on banking operations and the foreign exchange fund until next week when the meeting of the legislative bureau begins the bebate on the budget bill, but because of the comments of various reports during the Easter holiday he had to expound on the issue to clear away confusion.

Power Must Be Exercised Immediately Without Open Debate and the Legislative Bureau Should Focus on Preventing Problems

1. Adopting basic policies with minimum risks to protect the economy.

As the financial secretary I have confronted many problems in the banking field since the end of 1982 and the government has solved all of them in the most appropriate manner. Hong Kong's trade, industry, and employment depend on the stability of Hong Kong and its financial system. The consistent basic policy of the Hong Kong government is to maintain the stability of the two. When solving each problem, we pay special attention to adopting the policy of minimum risks. Our main goal is to protect the deposits of Hong Kong citizens and the faith of Hong Kong and international bankers in Hong Kong's banking system. We need to put out the fire when the fire alarm goes off, and we should adopt the most appropriate measure to put out the fire at the minimum cost before the fire spreads. Our greatest concern is not the area of shareholders and management but how to make Hong Kong a place where Hong Kong and international depositors feel at ease with their investment--no matter how much they have on deposit.

2. Adopting immediate action needs power that can be exercised immediately.

Because of this, the financial secretary and bank supervisors and managers must have the power they need. If an immediate action is required, relevant authorities must be able to exercise such powers immediately. This is why the financial secretary can exercise the power endowed by the regulations of the foreign exchange fund as he sees fit. By the same token, the regulations of banking operations also give bank supervisors and managers power that can be exercised immediately. Because every international center abides by the security principle of banks and because stocks are sensitive to information, it is impossible to carry out open debate. Such power should not wait for a debate on policies in order to be exercised. If the financial secretary and bank supervisors and managers thought they had no such power or were afraid of exercising their power and sat by and watched banks closing down and ignored the resulting runs on many banks, they should be blamed.

The Hong Kong Government Seems To Play the Role of a Central Bank

3. Preventing the rise of problems.

Our concern is what really happened, not theoretical possibilities. The debate should not involve the power to deal with fire alarms, but the prevention of fire alarms. The draft of the new rules and regulations for the banking business was drawn up after considering these problems.

4. The question of whether there is enough money in the foreign exchange fund.

If there is any confusion resulting from suspicion about the amount of the foreign exchange fund, let me clarify the situation. Surplus foreign exchange funds--I emphasize the word surplus--is Hong Kong's internal reserve fund. Although Hong kong is loaded with problems, the growth rate of surplus foreign exchange funds has been very satisfactory in the past few years and it will continue to be so in the future. The action we took to support some banks prevents, under the major premise of maintaining stability, the foreign exchange fund from being spent in a more direct way at an even higher cost. Even if the fund were used to maintain the stability of banking institutions or pay off all debts for them--the chance of this is next to nothing--the expenditure of the foreign exchange fund will be much lower (repeat: lower) than the increase of surplus (repeat: surplus) fund in the past 4 years. In other words, the actual amount needed to support these banks is within the limit of the growth of the surplus foreign exchange fund. The adoption of such an action may prevent the possible serious loss of the fund and, more importantly, social and economic confusion and trouble. The confidence of foreign countries in Hong Kong is the clear evidence of the success of this policy. Some international banks are still waiting in line to get into the Hong Kong market whereas one of the reason for such confidence is that all international bankers deeply believe that the Hong Kong government would act like the central bank of any other industrialized society and handle the problem as soon as it arises.

NATIONAL POLICY AND ISSUES

PRC JOURNAL ON CHANGE IN ECONOMIC OPERATIONAL MODEL

Beijing JINGJI YANJIU in Chinese No 2, 20 Feb 86 pp 3-11

[Article written by Hua Sheng [5478 3932] and He Jaicheng [0149 1367 2052] of the Economics Research Institute of the Chinese Academy of Social Sciences, Zhang Xuejun [1728 1331 6511] of the Economic Readjustment Office of the State Council, Luo Xiaopeng [5012 1420 2590] of the Rural Development Research Center of the State Council, and Bian Yongzhuang [6708 0516 1104] of the Financial, Trade, and Material Economic Research Institute in January 1985: "Transfer of Economic Operational Model--Problems and Train of Thought on Further Reforming the Economic System"]

[Text] China has already spent 7 years in carrying out its economic structural reform. The initial success in rural reform has laid the foundation for an all-round reform and urban reform has also achieved major progress along the path of transferring power downward and enlivening enterprises. The market mechanism is gradually becoming a basic factor of China's economic operational system. But there are also many problems. In many areas and enterprises where we have relaxed control, there is already confusion in the course of invigoration and irrational practices are spreading. The question of where China's economic reform is headed has already become the focus of world attention.

I. The Problems China Faces

Fundamental difficulties for China's Economic Structural Reform

1. Over the past few years, the expansion of total demand has given rise to complicated repercussions in our society, fully disclosing that the economic structural reform is not one single act of a set of mutually coordinated acts, but an arduous and prolonged historical process. Even the so-called "one-package" economic reforms to shift the economy onto a new track that some Eastern European countries have been carrying out have all turned out without exception to be prolonged social movements that continue to correct themselves and deepen. (Footnote 1) (Many Hungarian economists hold that only by now can there be a hope for the Hungarian economic reform already underway for 17 years, to really begin. Refer to Hungary's ECONOMIC REVIEW No 11, 1985)

2. China's economic structural reform started relatively late, but the actual progress of the transformation of the economic operational model has been

relatively quick. There has been a trend for some major aspects of this transformation to exceed the progress of reform in other spheres. Therefore, it is necessary not only to find a special path for China's economic reform, but also to probe into the general law that governs the economic reform of socialist countries. In this sense, the difficulties in China's "second revolution"--the economic structural reform--are greater than those in the first revolution for the purpose of seizing the state power.

3. A sharp fluctuation in the total amount of effective economic demand is a pressure difficult for any society to bear. It is particularly dangerous in the process of economic reform. The peak of the expansion of total demand has already passed, but it continues to pressure us and make our macroeconomic decisions tend to become short-term and low-level. This is a clear proof of its danger. The difficulty lies in how to make a distinction between the interference of that short-term imbalance caused by the macroeconomic turbulence and the real challenge facing economic reform.

4. Fundamentally speaking, the economic structural reform is a consequence of the failure to effectively develop the economy; hence if we talk about reform in separation from development, it is impossible to really solve the problems related to economic development. But because the development of economy is a continuous dynamic process with a strong continuity, it is impossible for us to suspend economic development until we have carried out reform. Undoubtedly, the pressure of long-term development makes it even more difficult to choose the chain of thought for reform.

Major Problems in Continuing the Reform

5. Special forms of the transformation of the economic operational model. The transformation of China's economic operational model has embarked on a path of gradual progress and adopted the two-tier system format. To this, people both at home and abroad have voiced their objection in light of the general experience gained in the transformation from a centralized economy to market economy in the West after World War II or from the transformation of models in Eastern European countries. But why should the trend of two-tier system have emerged in China alone? What will be its unique prospects of development? If we do not understand these questions, we will not be convincing either in criticizing or supporting the two-tier system.

6. The organization, zones and structure of the market. Since we began to decentralize power and enliven the economy, a market has not correspondingly taken shape; in addition, problems such as blocked channels of commodity circulation, regional bottlenecks and poor economy of scale have emerged, indicating that in fact we do not have the clear idea of the connotation of the goal of the transformation of our economic operational model which we thought we had. What a planned economy reveals is only one feature of a modern commodity economy, namely, the state's management over and intervention with the market, but it does not reveal the scope and structure of the market itself. Is it a national or a regional market? If it is the former, would it have a great repercussion on China's economic development and layout of productive forces? If it is the latter, how would it affect the nature of the

transformation of our economic model? At present, the structure of China's industrial scale is already a structure in which large enterprises have a dominant position; therefore, it is perhaps not easy for a market structure of free competition to take shape after our market has switched to operate in a planned way. If we are not clear what kind of scope and structure of market that the economy is to switch into, then in practice, the transformation of the operational model cannot help but give rise to extremely sharp conflicts and blindness.

7. We are to once again lay a microeconomic foundation. The operation of a certain economic system is based on the prerequisite of corresponding relations of production. In a socialist economic reform, if we neglect the restructuring of microeconomic foundation while transforming the model of economic operation, then no matter how skillful the design of the models of market functions and the regulation of market mechanisms, there will certainly be breakdowns in the operation or it will be utterly impossible for the models to operate. This is the major experience gained in the great victory in the initial battle of rural reform and is also the basic cause of the difficulties in carrying out our urban reform.

8. Readjustment of income distribution. The friction and difficulties that have emerged as changes begin in the structure of income distribution does not prove that China's ancient philosophical idea "the trouble is inequality rather than shortage: still prevails. The crux of the problem is whether this change in income distribution means a change into awarding people on merits or a clear inequality of opportunities? The international experience that we can refer to proves that the skill in handling income distribution is often vital to the destiny of the reform. Reexamining the train of thought in reform related to the issue of income distribution is thus an urgent task for reform in a large country with extremely complicated conditions and for winning over universal understanding and support of the people.

Basic Clues in Carrying Out Reform

9. In the face of a chaotic situation that seems to be impossible to straighten out, people often give a, perhaps to some extent, simplistic explanation that we have not yet coordinated the reform in various spheres. Why have we failed to do so? In what spheres must our reforms be coordinated and formed into a full set? What reforms should consciously be separated from one another to reduce risks, difficulties and resistance in reforms? (The concept of economic reform itself means that it is separated from the cultural, educational, social, and even political reforms which are linked with it and which should also be carried out in light of conditions we are provided with and in order of significance and urgency.) The mission of our economic analysis is not to provide people with a confused system, but should be to correctly analyze a complicated and processed system of logic, point out the basic clues to it, and turn it into a historical process with order in time and space.

10. To find clues to the solution of the problems related to the whole system of the current economic structural reform, we must return to the cells of our planned commodity economy--our enterprises. We can say without exaggeration

that all the contradictions and conflicts have originated from the great experiment that is aimed at turning our state-owned factories and shops into genuine enterprises. All the friction in our macroeconomic regulation has emerged because we regard as enterprises the economic units that are in fact not enterprises in its proper sense, and regulate them as such. To really turn state-owned enterprises into economic entities that shoulder sole responsibility for profits and losses, in our economic reform, we must complete two most basic projects: 1) the transformation of the economic operational model to a format that is suited to national conditions; and 2) the simultaneous realization of the restructuring of the foundation of our system of ownership. Because of limited space, this article only discusses the first project.

II. The Two-Tier System: A Special Form for the Transformation of China's Economic Operational Model

11. What is essential in the transformation of our economic operational model is to initiate the market mechanism, mainly, the price mechanism. People always use the word shortage to sum up the characteristics of a highly centralized planned economy. In fact, shortage is to a very great extent the consequence of the implementation of a system of fixed prices. The mechanism of planning, material distribution and fixed prices of the traditional economic model operate together. The system of mandatory plans relies precisely on the strong distributive nature of the planned prices and thus firmly controls the allocation and circulation of materials and goods. Only by so doing can its administrative system operate in harmony. Enterprises are also divided into various classes because of the difference in their plans and their channels to obtain materials and goods; in other words, the difference in the amount of materials and goods that they can obtain at low prices and to the degree in which the sales of their products are ensured. This determines beforehand that the distributive relationship between the state and enterprises is certainly a relationship of eating out of the same big pot and a relationship in which what the state takes from the enterprises is greater than what it subsidizes them. From this we can see that the reforms in our price system and price management system put forth by the CPC Central Committee are pivotal to our economic structural reform. This shows the thoroughness of China's sweeping economic structural reform at its very beginning.

Historical Necessity for the Emergence of Diverse Prices

12. The Two-Tier price system is a typical reflection of the coexistence of dual systems in the period of the transformation of the model. The train of thought in understanding the reform of the two-tier system cannot be separated from China's actual historical environment. At the beginning, China transplanted the highly centralized model from the Soviet Union, but because China was a vast underdeveloped country, even the period of the highest degree of its centralism, the proportion of its products under the unified central planning was far lower than that in the Soviet Union and other Eastern European countries. Before Yugoslavia's reform in 1951, over 16,000 kinds of products were governed by central planning and were to be distributed among 165 ministries, several hundred bureaus and 8,000 enterprises. In the Soviet Union, the State Planning Commission governs over 2,000 kinds of products, and its central ministries distribute more than 30,000 kinds of materials and goods. (Footnote 2) (Liu

Guogang: "Economic Theory and System of the Soviet Union and Eastern European Countries" Zhanwang Publishing House, 1984 p 196) In 1979, China's State Planning Commission and General Administration of Materials and Equipment allocated only 256 kinds of materials and goods. In addition, China's planning system is of many levels. In 1979, local governments distributed 46 percent of our coal, 42 percent of our steel, 36 percent of our nonferrous metals, 18 percent of our timber, and 71 percent of our cement. (Footnote 3) ("China Economic Yearbook 1981" vol 4, p 124) For the same product, the central allocation price was often different from local distribution price. Besides, after the 1950's, China began to implement the policy of developing large, medium-sized and small enterprises simultaneously and walking on two legs. At that time, we experienced several setbacks, but the local state-owned enterprises that were not included or that were not entirely included in the state's distribution plans, especially township and town and rural collective enterprises, continued to account for a fairly large proportion in the national economy. This economic strength that has grown on the weak link of the traditional system consummately embodies the latent market factor in our planned economy. This is a phenomenon unique to China's economic development. It makes it impossible for China to make up the shortage of its planned distribution by haggling between upper and lower levels and between units at the same level, by searching, waiting or compulsory substitution, or by periodically laying production capacity idle as the Soviet Union and Eastern European countries do. Therefore, since the beginning of the 1970's, the economic cooperation outside state plans, barter and compensation trade has universally developed. (Some of the trade is even arranged by the governments at provincial level.) Since the beginning of the economic structural reform, the proportion of the output of urban and rural collective enterprises in the total output has continued to rise sharply. At the same time, outside the state plans has gradually switched from awkward barter to the trade at price premiums or at market prices. According to statistics, by the end of 1984, the turnover of materials and goods outside the state plans reached 50 percent of the turnover of the products allocated at planned prices. Because of the difference in circulation channels and relations between buyers and sellers, it was quite common for one product to have diverse prices. The emergence of diverse prices other than the planned one has broken the restriction under the traditional system in which the state-owned sector does not allow others to produce what it will not produce. This has been instrumental in readjustment the structure of industry, reinvigorating rural economy, improving the behavior of enterprises, and releasing production potential; but at the same time, it has indeed also yielded the negative impact in giving rise to speculation in resales of goods, in enabling small enterprises to have an advantage over large ones, and in giving rise to poor economy of scale.

13. Why have such strong collective enterprises in rural towns and strong township enterprises emerged only in China? In addition to the above-mentioned process, there are far-reaching social and economic causes. Ever since the establishment of the socialist ownership by the state in China, we have been faced with an extremely sharp contradiction: to feed one fifth of the world population with our very weak national strength (the per capita national income was 103 yuan and the per capita financial revenue was only 30 yuan). Therefore, except for the provision of necessary material aids to the poorest people by the

state, at the very beginning, it was not only necessary to provide rural people full freedom to "shoulder sole responsibility for profits and losses," but even in cities, it was also impossible to ensure that everybody had equal employment opportunity and social welfare and insurance. This has naturally produced a level by level division into central and local state-owned enterprises, enterprises owned by the state, collective enterprises, and large and small collective enterprises. Since the founding of the PRC, the state several times tried to relatively sharply increase the urban population and the number of employees in state owned enterprises, but was forced to stop or withdraw later because of limited financial resources. Only by relying on the persistent efforts of millions of laborers for their survival and for making themselves rich have urban and rural collective enterprises been able to maintain their existence amid repeated setbacks and to form a trememdous wave of development under the fine situation of the reform.

Making the Best Use of the Two-Tier System

14. This is precisely the background in which the train of reform thought about the two-tier system was put forth. This train of thought fully confirms the historical necessity and positive significance of the emergence of diverse prices in China. At the same time it tailored measures to the situation and designed the two-tier price system to overcome major defects of diverse prices. (Footnote 4) (Hua Sheng et al: "On the Path of Price Reform with Chinese Characteristics," JINGJI YANJIU No 2, 1985) In other words, 1) we declare that market prices are legitimate, and develop the potential of large enterprises for competitiveness; 2) the state participates in the organization of work to smooth bottlenecks in markets, put marketable materials and goods in short supply on the market to force market prices down and thus causes diverse prices to become one price; 3) the state, raises the listed prices to reduce the disparity between listed and market prices and thus cracks down on speculators; and 4) it strictly imposes the rule that products made of materials purchased at high prices be sold at high prices and those make of materials bought at low prices be sold at low prices, thus creating market and price conditions for roughly equal competition. The State Council's policy decision on the implementation of the two-tier system for price reform is not only conducive to making the structure of production better, but also greatly reduces irrationality in the internal structure of production scale. By so doing, it has turned a spontaneous process into an extremely important step of economic reform. The two-tier price system will further monetarize cooperation orginally outside state plans and exchanges of materials and goods, and formally initiate regulation of market mechanisms in the realm of state-owned enterprises activities (including large and medium sized enterprises). This marks the beginning of a sense of direction in the transformation of our economic operation model.

15. It was a pity that as we were planning price reform, we suffered a sudden attack of excessive expansion of total demand, which sharply pushed up market prices, made it very difficult to raise listed prices, and thus widened the difference between the two kinds of prices and speculative resales of goods. As a matter of fact, it has become impossible to implement the major steps of the two-tier system reform. Nevertheless, the small number of measures that we have initially adopted alone, such as the measures to allow state-owned

enterprises to sell some of their products on their own at market prices and the organization of an automobile market by the state, have already proved the tremendous power of reform in the direction of the two-tier system. Through sales in the market, raising funds for investment and other measures, extra-budgetary funds have begun to spontaneously make short-term movements and we have substantially alleviated the deterioration of the production and investment structure, a tendency arising from a distroted listed price system. In particular, because of shortages of funds, many large and medium-sized enterprises that produce raw materials and fuel, were unable for a long time to solve problems of incomplete equipment and problems related to the renewal and transformation of their technology. Now they have quickly raised large amounts of funds and there is a strong tendency of sustained increase in production. The automobile market, established with direct state intervention, has quickly stabilized prices of automobiles which rose dramatically because of rampant speculation at the time total demand fiercely expanded. Later, market prices of automobiles were the first to drop and took the lead in signaling for the end of the expansion of total demand. This accurately and promptly provided a reliable basis for macro policy decisions. Therefore, if we persist in regarding the reform to establish the two-tier system as the cause of problems such as turbulance in the market and small enterprises crowding out large ones--problems that are apt to crop up in a situation of diverse prices--then, obviously we will show that we lack understanding about the process of the development of history.

16. This of course does not mean that the two-tier system is perfect as a transitional system. Some comrades have pointed out that the transition to a two-tier system will be repleat with friction and sharp conflicts. They suggest that China follow the path of a transition of mixed prices that some Eastern European countries have taken. Under this system, only one price is allowed for one product, the prices of the products of which the supply and demand are in balance and are to be decontrolled, and all the products for which the internal and external prices differ greatly are monopolized by the state at unified fixed prices. By so doing, we would give rise to a price system formed by several different sectors and then transform it into a system of uniformed market prices. But the difficulties are that: 1) a price system is an integrated whole with mutually linked and dependent parts. How can prices of some products be kept fixed while prices of other products are really free? How can there be no extreme friction and clashes between these two kinds of prices? 2) At present, the most important materials and goods in short supply such as the three major materials are more than 50 percent under state control. How can the state monopolize all of them? Even if it could, how can it arrange the supply of these goods to satisfy the demand of each and every enterprise including 6 million township and town enterprises? Are we to allow the demise of enterprises that are not allocated with the materials and goods by our plans and that have no sources of purchase and are not allowed to purchase these goods? It seems that that suggestion is to a large extent divorced from China's reality.

Improving the Two-Tier System

17. The key to the two-tier price reform is to consolidate and establish a smooth-flowing market of means of production. If we cannot manage to ensure

that there is supply of goods at market prices in our market of means of production, the under the pressure of maintaining their production, in addition to striving for a greater share of planned allocation, even enterprises which observe the law will be forced to establish under-the-counter relations. As a result, there will be speculative resales of goods and loopholes for profiteers to exploit, and it will be impossible to put an end once and for all to the bad practice of keeping irrational levels of stock at every level and thus artificia-ly worsening the shortage of materials and goods. In China, we should not have the illusion that markets of large-scale flow of goods can take shape through free sompetition. The state must adopt powerful administrative means, conduct concrete organizational work and make detailed arrangement to expedite the formation and emergence of major markets.

18. The state accumulates its strength and raises the listed planned prices of the products in short supply. This is one of the basic aspects of the train of through about proce reform through the two-tier system. No matter how great improvement it is compared with the system of diverse prices, the two-tier price system in which listed prices differ greatly from market ones is after all a transitional system. It is impossible for this system to eliminate all the defects of the system of diverse prices, in particular the defect of seriously distorted planned prices. This is hown in the following: 1) The continuation of adverse readjustments in the spheres of production and consumption by excessively low planned fixed prices. 2) The marginal price readjustment role of market prices can gradually readjust the composition of production, but because of the existence of low planned prices for products in short supply, market prices will be substantially higher than equilibrium prices; therefore, enterprises can earn extra profits. In addition, as marginal demand decreased relatively quickly when the market is saturated, and as we do not have appropriate methods of taxation to restrict the construction of the projects that do not enjoy economy of scale, some enterprises are apt to be short-lived and thus suffer financial losses. 3) Different price signals in the two markets will inevitably foster friction and waste, especially when it is possible to haggle for quotas of cheap supply at planned prices, they will give rise to confusion in the behavior of localities and enterprises. As the two-tier prices are in fact a kind of price discrimination and division of the market; therefore, the key to the success of the two-tier system is that there must be a barrier between markets that are planned and outside of plans so that speculators have no loopholes to exploit. We propose that while we raise listed planned prices, we should sort out the targets of planned supply, substitute compulsory contracts of supply of goods that are made in strict accordance with the principle of products made of raw materials purchased at low planned prices being sold at low planned prices for mandatory plans for short-term input and output of enterprises, and allow all the products not covered in the contracts to be traded at market price, no matter whether the transactions are made among central departments, localities or enterprises. The products sold at low planned prices and the materials purchased at low planned prices in contracts for an enterprise are strictly matched and the products and materials not covered by the contracts are traded fairly among enterprises at market prices. We can thus not only eliminate loopholes between the two markets, but also, because we have already straightened out the external environment for the relations of planned material and goods between various enterprises, in the future, when the state raises the

listed prices, it will only be necessary to change the contracts of supply of goods and won't be necessary to again change the economic and financial relations of enterprises.

19. The universal significance of the two-tier system is not limited to the reform in the prices of means of production. In China, the purchases of agricultural products by contracts of order and those by negotiation are anther form of the two-tier system. The state's pruchases of large amounts of agricultural products by contracts can ensure the state has sufficient reserve of agricultural products, stabilize peasants' income, and guide the output level and direction of cultivation of agricultural products. Fluctuated transactions in the market can satisfy the diversified demand of production and livelihood and sensitively reflect the trend of changes in the costs of agricultural products, and thus become a mirror for the readjustment of prices of purchases by contracts. In future, when major buyers of grain become the grain and edible oil companies that have been turned into enterprises, the vitality of this two-tier format will continue. In China's financial and foreign exchange activities, to ensure the monopolized control and operation over the most important economic activities by the state or by the agent representing its interests and at the same time fully absorb the flexibility and perpetual stimulus of free competition and the regulation of market mechanism (certainly a must for a developing country whose economy is taking off), it is certainly also the trend of the times for us to adopt the two-tier system in financial reform and the foreign exchange market.

20. The theoretical significance of our two-tier system is that it shows that because of its special historical background, China's economic development and economic structural reform will not be realized amid a general balance in free competition, but will mostly be realized in an imbalance, self-stabilized system. On the other hand, both its economic development and structural reform depend on the efforts of enterprises in freeing themselves from administrative subordinate relations and inequality between different grades of enterprises. This requires a kind of form or path to enable us to break the system of inequality between different grades of enterprises before we complete the transformation of the entire vast operational system. The two-tier system provides such a form and this is its hostorical contribution. It is precisely in this sense, the two-tier system is a special form of transformation with relatively small risk and very great capacity that China has found. It is a great invention in China's economic structural reform.

III. Market Organization, Structure, and Areas

Market Organization--Decontrol of Prices Does Not Equal Formation of Market

21. A view has been in vogue that our economic structural reform is mainly aimed at decontrolling prices and developing the role of the regulation of market mechanism. Therefore, if problems crop up in decontrolling prices or in developing the role of the regulation of market mechanism, then surely, we have failed to satisfactorily carry out reform. In fact, this is a big misunderstanding: for the decontrol of prices is regarded as identical to the formation and perfection of our market. Historically, small commodity

production has always had free pricing, but if often took several decades or even several hundred or 1,000 years of development for specialized circulation organizations to become independent and separated from one another and for large-scale commodity distributing centers to emerge. Therefore, in a developing country like China where the degree of the commodity economy development is extremely low, inequality of opportunity and speculative resale of goods are unavoidable in the transition from unified and controlled prices to market prices, no matter what form of transition we adopt (two-tier or single-tier systems). This is because of the restriction of factors such as lopsided merket, poor transmission of information, blocked circulation channels, and inconvenient transportation. Clear proof of this is the lack of unified price in the open market; this becomes the major loophole for speculators to exploit. Therefore, during our price reform, the state's priority task is to organize rather than to regulate the market, in other words, to help establish markets through its intervention.

22. In current commodity economy, market organization first of all means the establishment of specialized circulation organizations and wholesale trade centers with stable and widespread circulation channels. In the period China implemented a highly centralized planned economy, it had already established a system of ciruclation organizations that had been the most powerful in our history, but the closed nature of the planned allocation service and the separated nature of regional balance very greatly restricted its functions. Therefore, transforming old circulation organizations, especially commercial, materials and gods wholesale, and cooperative supply and marketing organizations are the starting point for the establishment of our market organizations. Otherwise, the closed and monopolistic nature of the old organization will stifle the vitality of the growth of the new organizations, or the vicious spreading of the noneconomic speculative force will cause dislocation and confusion in the market. The establishment of free wholesale trade markets is a brand new undertaking for us; for it not only needs the existence of a large number of open circulation organizations, but also relies on widespread links in the channels of supply and marketing in our trade centers and markets. Strictly speaking, without the widespread establishment and normal operation of wholesale trade markets, especially future markets, we simply cannot talk about the formation and perfection of our market. A product market without future markets is merely a superficial and lopsided market, the price signals given by it are very short-term ones; as such, their regulation over the supply and demand relations is too frequent and will give rise to turbulence in the market and extremely high costs. In fact, the system of monopolized purchases and centralized allocation under the traditional economic structure to some extent played the role of a future market in stabilizing production. Hence if we cannot establish a future market, it will be difficult to reform the system of monopolized purchases and centralized allocation.

23. The barter and cooperation related to materials and goods outside the state plans are the soil to nurture our market mechanism. But, in the process of the development of price reform, widespread barter of material and goods hindered the commercialization process of our economy. People cling to maintaining noncurrency cooperative relationships often because they pursue special interests of localities, enterprises, employees, or even a small number of people. Undoubtedly however a major worry for enterprises is the lack of a

fully commercialized market which thus fails to satisfy normal and temporary demands of their production. As such, given the situation today, if our governments at each level continue to exert great effort to organize cooperation related to materials and goods rather than switch to organizing currency trade markets, then they will only hinder the establishment and perfection of the commodity market.

Market Structure--Prospects for the Development of a Two-Tier System

24. The purpose of organizing our market is establishing or strengthening links among the enterprises in the market. In a commodity economy, risk is a concept as important as profit. Risk obviously differs in transactions between enterprises of different economic scale and so do the economic relations between these enterprises. But these relations are restricted by the structure of our market. Market structure is classified according to the scale of enterprises, market share, and capacity to control the market. As market structure varies, so does the behavior of enterprises, the mechanism of price formation and laws governing price movement. At the current stage of the development of the socialization of production, the commodity market in most countries is of a structure of monopolized competition. In China, however, the degree of concentration of enterprises is not only lower than in developed countries, but also significantly lower than in developing countries of the same level of development, because of reasons such as administrative subordinate relations of our enterprises, the demand for internal balance in small yet complete regional systems, the product tax system which hinders specialized cooperation, and particularly, funds which are locked into assets and fund circulation which is blocked owing to the level by level breakdown of public ownership. (Footnote 5) (According to a report by the World Bank in 1984, in the early 1980's the number of enterprises with a work force larger than 243 people accounted for 0.6 percent of the total number of enterprises in China, 4.3 percent in South korea, 4.4 percent in India, 33.5 percent in Yugoslavia, and 65.1 percent in Hungary.)

25. Despite this, the planned market that China's economic structural reform wants to establish is greatly different from the primary model of free competition. (Footnote 6) (According to Industrial Statistics Annual, in 1984, the large enterprises that account for 2.8 percent of the total number of enterprises have 50.6 percent of the fixed assets and yield 37.3 percent of the output value, and 47.6 percent of the profits and tax payments of all the enterprises in the country.) As China's economy develops, the market structure will gradually become a structure of monopolized competition. This trend of economy of scale which has emerged on the basis of contemporary science, technology, and production organization, is a historical stage that we cannot surpass in implementing a planned commodity economic system. Therefore, in designing the targets of China's economic structural reform, we cannot have a vague hope for a market of completely free competition, but should consciously help our large enterprises and groups of enterprises grow and thus facilitate the development of satisfactory scale of economy. Generally speaking, large enterprises make relatively long-term planning and have relatively strong sense of social responsibility; as such, they naturally often become the dominant force in the economy. Yet, our small enterprises are usually more dependent and mostly adopt the

strategy of paying close attention to short-term demand in the market. Of course, this does not mean that we should give large enterprises boundless preferential treatment and passive protection, but means that we should encourage highly efficient enterprises to defeat and take over inefficient enterprises to enable their rapid development and expansion. Through the rise and fall of different enterprises, we will realize the concentration of resources in the hands of highly efficient enterprises and thus give rise to the optimium combination of scale for the dynamic growth of the economy. Only by so doing can we continue to maintain and heighten a powerful capability in mobilizing resources and guiding the development of production through a change in the system and on the basis of high efficiency. This is too important for China as a vast developing country.

26. From the above, we can see that in the planned market in the future, the two-tier system in the present sense will fade away, and we will perhaps have a system which is neither the old one in which the state fixed the prices, nor an entirely free market where prices are decided by competition. Since the reform in the pricing of nonstaple food in China's urban areas, the economic strength, access to information, and pursuit of medium- and long-term interests of state-owned commerce and some large urban and rural collective economic organizations are different from those of small enterprises; as such, their pricing mechanism is also very different from that of small producers in the market. But, because the current price level is relatively suited to supply and demand relations in the market, they can readjust prices by referring to long-term market trends and so their existence is reasonable. In our market of materials and goods, a trend has already emerged that some large enterprises intend to control the price movement by means of jointly fixing the prices for the products in their line of production. In a comtemporary monopolized competitive market, the commodity prices of modern monopoly enterprises are obviously stable, with little fluxation, because the short-term average cost curves of monopoly enterprises are relatively smooth, large monopoly enterprises are related to many sectors and are of great importance, the external costs for price changes are relatively high, and monopoly organizations lose some market share when they raise prices and are followed by competitors when they reduce prices. This is in sharp contrast to the drastic fluctuations in competitive prices of medium-sized and small enterprises. From this we can see that it is idealistic guess work about a commodity economy to think that there can only be one mode of price for the market price. Only, the diverse modes of market prices are reasonable because of the production organizational structure and market structure. These diverse prices differ in essence from two-tier prices today in that they are not fixed by the state but entirely by enterprises. Therefore, we can infer that when state commercial and material and goods administrative units are switched from the state administrative units under the jurisdiction of the government into large enterprises competing with one another, they would continue to dominate the market like the large enterprises and enterprise groups in the production sector. On the other hand, the only reason why a socialist country should firmly control the planned distribution and pricing of major materials and goods, is that when there is a major shortage of materials and goods, we should guarantee the superior and monopolistic position of enterprises which are the backbone force for the industrialization of China to speed up economic development. It is therefore very possible that the state's

fixed price in the two-tier price system will gradually evolve and be changed into the price fixed through the negotiation among large enterprises and enterprise groups or the dominant price in the line of trade. From this we can infer that the withering away of the two-tier system would depend not only on the rationalization of the price system, but also on the formation of market relations (including stable circulation channels among large enterprises and enterprise groups and the future market) that can entirely replace the state's allocation system.

Market Areas--Differences in Economic Geographical Environment

27. The formation and establishment of market prices depends on the changes in the areas or scope of market. A market that is divorced from the concept of space is merely an abstract concept of market, not a real market. For the establishment of a market that is open to the outside world, there should first be a reform in the taxation on circulation of goods. Since this is a question related to a very special field, we will tackle it later. The disparity in China's domestic market alone is enough to draw the attention of world economical circles. Because China's history of having been a semicolonial and semifeudal society, the economic geolographical enviornment differs broadly in various areas. There is not only the problem related to the dual economic structure between urban and rural areas, but also the "North-South" problem between its western and eastern parts. The key cities which are few in number and which have only 4.7 percent of China's population, yield a third of China's gross industrial output value. (Footnote 7) (Calculated on the basis of the date in the tables entitled "Basic State of Affairs in Key Cities" in "Chinese Statistics Yearbook (1983)" pp 35-102.) According to the estimate by the World Bank, China's urban living standard is on average two or three times better than that of its rural living standards. Regional dispartiy is even bigger. For example, the per capita industrial output value in Jiangsu Province is twice that of Gansu Province; while the per capita agricultural output value in Jiangsu is nearly three times that of Gansu. Liaoning's net visible output value is 3.2 times that of Guizhou's and Shanghai's is 11.1 times that of Guizhou's. Even in the same line of trade, the retorn to capital employed differs widely in different areas (see table below). These great disparities in urban and rural areas and in regions are facts we must consider and face squarely when we transform China's highly centralized system of planned allocation with the state collecting all the income and paying all the expenses into a planned market model.

Profit rate (defined as the sum of profit and tax payment divided by net value of fixed assets) of the state-owned industry for 1982 calculated for different sectors in various provicnes

Area	Jiangsu	Hubei	Gansu	National Average
Industry				
metallurgy	22	17	10	23
power	38	19	24	23
chemical	37	20	18	38
machine building	34	14	14	21
textile	100	58	54	81
paper	50	17	7	33

(Source: Report of the World Bank's 1984 Group to inspect China's economy)

28. One of the possible choices is to follow the path of a unified market. The contradiction in this path is that as we establish a unified domestic marmet, especially as we perfect the market system, there would be a tilted factor market in the whole country. Increasingly violent movements of production factors and various resources from rural to urban areas and from western to eastern China would emerge. The production capacity in central and western China would be moved away and die out, the production layout would worsen overall and the regional disparity in economic development and income would continue to widen. There may be a sharply titlted commodity market in which goods move from east to west, in other words, the goods from Shanghai and coastal areas would occupy the market in central and western China. At the same time, since selling goods at home would be profitable and since there is a vast domestic market, the export drive would be weakened in coastal areas. As a result, commodities from Japan, the United States and other countries would again flood eastern coastal areas. Under these circumstances, the desire to thoroughly modernize coastal industry and to move traditional industry to the hinterland and rural areas would all go up in smoke. Obviously this is not a prospect we want. From the above we can see that in development of a unified market with unclean ideas over the past few years, the division of markets in many areas and regional barriers are not without any elements of "justified defense."

29. Another choice is to develop regional markets. Those who favor this choice hold that the improvement in the rate of utilization of the resources in the areas would offset losses caused by friction between various areas. But, in an integrated political state, the greatest issue concerning regional marekts is the barriers on boundaries between various areas. There would be no regional market whatever if besides the natural barriers caused by geographic conditions, there are no artificial barriers including barriers along the boundaries and customs duties. At the same time, people also worry that the practice of developing regional markets might inevitably push up the average social costs of the commodities at home. Therefore, at least so far we do not see any prospect for the realization of this choice.

30. In China, we should develop the advantages of a unified market and take tino consideration also dispartities in the production conditions in different areas. This is perhaps the second best choice, a choice to follow the path of having a unified domestic market while taking into consideration regional production costs. The differences in economic geographical environment can be summed up as the geographical difference in land. As such, we can make a proper distinction between the production conditions of rural and urban areas and in different regions to bring their strong points into play and competition on the basis of earning roughly the same level of operational income despite different production costs. As the rationalization of production layout is ensured, we can be assured of good economic results from the distribution and layout of resources before we know the efficiency of the utilization of resources. For a country with vast territory and huge resources such as China, we should pay sufficiently close attention to the idea that "the layout decides 30 percent of the results."

31. Land tax (rent) must be collected by localities and be a source of their revenue. Judging by the situation in most countries, land taxes or rents are

universally the major sources of local government revenue. Therefore, it is necessary to become clear about the role of localities. Over the past few years, people have frequently blamed localities' role in overexpanding the total demand. Of course, they have good reasons to do that. Yet, very few people have ever had the idea that the behavior of localities, in particular those at provincial level, are molded and regulated by evaluation indexes and the interest distribution system decided by the central authorities. When the central authorities regard gross industrial and agricultural output value as the yardstick of evaluation and distribute financial resources according to administrative subordinate relations, it is inevitable that localities get the urge for unrestrained expansion. To turn localities, especially those at the provincial level, from magnifiers of demand overexpansion into controllers of demand overexpansion and to switch their focus of attention to various aspects of environmental service for the operation of their economy and to large scale development of a tertiary industry that is proportionately harmonized internally, we must universally substitute the comprehensive index of gross national product for the index of gross output value, and we must first carry out a financial reform in which we substitute graded local taxes, the collection of which is stipulated by law, for different practices in apportioning government expenditures among various social sectors--a financial reform whose core is the alteration of the composition of local government financial sources.

There is an internal symmetry in the expenditure composition and revenue composition of local finance. Even if we implement a system to divide tax revenues among governments at various levels, if the major financial resources for localities are shares of income and product taxes, then local governments would certainly pay attention only to their industry and commerce, especially those related to cigarettes and wine, which earn high profits and pay much in taxes. If the major financial resources for localities are taxes on land, then they would spontaneously be concerned about and carry out construction of basic facilities.

32. As for the basic steps to collect land taxes, we can consider the following: 1) On behalf of the central authorities, the Ministry of Finance estimates the base figures of taxes on various land in all the provinces and regions and the cities under them. 2) These base figures would be taken into the base figures of the financial revenue of various localities and thus their shares of other kinds of taxes would be correspondingly reduced. 3) The power to actually collect land taxes should be granted to localities, but the central authorities could preserve the power to fix the maximum and minimum limit of land taxes. Land taxes should be collected after income tax. This would be conducive to turning land tax into rent later. 4) The provincial and regional governments would decide on their own the rate of their land tax and the proportion of burdens between areas under them and between their urban and rural areas. They could also first calculate the base figures as the central authorities do and then grant the pwoer of collection to cities and counties. 5) When localities collect land tax, they are in fact faced with the choice between options to prusue long-term or short-term interests. If they tax heavily, they would be benefited in the short run, but they would hurt the competitive capacity of their enterprises, reduce the investment attraction of their areas, and may thus cause production factors to move away; this

would be detrimental to long-term income. If the tax is too low, they would fail to satisfy the minimum demand of their financial expenditures. By so doing, through the independent choice of various local governments, various roughly suitable regional costs would spontaneously take shape. In areas where conditions are mature, we could further adopt the method of inviting tenders in the market to decide the amount of rent and thus transform the land tax system into the rent system.

33. When we have established a commodity market and perfected its functions, enterprises can look forward to being provided with external conditions to carry out reasonable competition. Of course, just as people have unaminously pointed out, this market is still narrow and should be coordinated by the markets of various kinds of production factors. Only then can there be a perfect market system. Nevertheless, we are afraid that China's economic structural reform cannot follow the general Western path from commodity to factor market. This is not only because factor distribution in China has, of course, special forms and channels, but also because the economic structural reform in a socialist country will first encounter obstacles common to its restructured microeconomic organizations. Straightening out market conditions and deciding regional costs only pave the way for the beginning of the tough battle in urban economic structural reform--the restructuring of the foundation of the ownership system.

(Writers' note: comrades Zhou Qiren, Ji Xiaoming, and Peng Zhaoping gave valuable opinions during the discussion of the article.)

GANSU'S HOU ZHONGBIN ON SIXTH 5-YEAR PLAN ACHIEVEMENTS

HK080323 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 7 May 86

[Text] In his government work report delivered at the fourth session of the sixth provincial people's congress, Vice Governor Hou Zhongbin said that during the Sixth 5-Year Plan, output of the province's major products reached or surpassed the targets set by the plan. The province also completed a number of capital construction and technological transformation products.

The province fulfilled 1 or 2 years ahead of schedule the plans for output of major agricultural products, except for a few items such as tobacco. The Sixth 5-Year Plan called for grain output of 5.25 to 5.5 million tons by 1985. The province has maintained output above 5.3 million tons since 1983. Output of oil-bearing crops, cotton, and sugarbeet respectively overfulfilled the planned targets by 87.8 percent, 2.7 percent, and 50 percent. Readjustments were carried out regarding 39 out of 100 major industrial products as a result of changes in the market, with supply exceeding demand. Output of the 61 other products reached or exceeded the targets set by the plan. Growth in output of energy, raw materials, and consumer goods was relatively great. A number of capital construction and technological transformation projects were also completed. Some 2.87 billion yuan in investment were spent on renovation and transformation projects, and 5.67 billion yuan in investment in capital construction were spent, a rise of 21.7 percent compared with the Fifth 5-Year Plan. Some 3,151 projects went into operation or gave benefit, increasing the fixed assets by 4.2 billion yuan, a rise of 26.2 percent over the Fifth 5-Year Plan period.

GUIZHOU PEOPLE'S CONGRESS HOLDS PLENARY SESSION

Hu Jintao Attends Opening

HK300831 Guiyang Guizhou Provincial Service in Mandarin 2300 GMT 28 Apr 86

[Excerpts] Spring is very much in the air and everything in Guiyang looks fresh and gay in April. The fourth session of the sixth Guizhou Provincial People's Congress opened at the Provincial Government auditorium on the morning of 28 April. Permanent chairmen of the presidium act as executive chairmen of the sessions. These are Zhang Yuhuan, Xia Yewen, Luo Dengyi, Bai Lin, Ran Yannong, Wang Bingyun, Qian Yunzhong, Liang Wanggui, and Zhou Yansong. The presidium was composed of leading comrades of the provincial CPC committee, the provincial advisory committee, the provincial discipline inspection committee, the provincial government, the provincial CPPCC committee, and the provincial military district, Hu Jintao, Wang Chaowen, Ding Tingmo, Su Gang, Shen Yunpu, (Liu Hanzheng), Zhang Shukui, Liu Yulin, Xu Caidong, Zhang Yuqin, Miao Chunting, Song Shugong, Li Xiangong, Wang Fuqing, Yang Hanxian, Tang Hongren, Mao Tieqiao, Zhu Yuru, Yuan Jiaji, Jian Xianai, Wang Qingyan, Meng Sufen, Zhang Chaolun, Wang Jingyuan, Chu Zhenmin, and Jiao Bin. Also seated with the presidium were (Xie Jinghan), the responsible person of the provincial higher people's court, and Li Ling, responsible person of the provincial people's procuratorate.

The session was presided over by Zhang Yuhuan, executive chairman of the session and chairman of the provincial people's congress standing committee.

Provincial Governor Wang Chaowen gave a report on the province's Seventh 5-Year Plan.

[Begin Wang recording] All delegates, on behalf of the provincial people's government, I am now going to give you a report on the province's Seventh 5-Year Plan for economic and social development for examination and approval.

The Seventh 5-Year Plan adopted at the recently concluded fourth session of the Sixth NPC is a blueprint for China's economic and social development in the latter five years of the 1980's. It indicates that China's socialist modernization construction has entered a new stage. [end recording]

The governor delivered a 20,000-character report to the representatives of the 30 million people of various nationalities in the province, on China's Seventh 5-Year Plan for economic and social development. His report was divided into five parts.

1. A review of the implementation of the Sixth 5-Year Plan. 2. The fundamental tasks and targets of the Seventh 5-Year Plan. 3. The focus of economic construction in the Seventh 5-Year Plan and the main policies and measures. 4. The targets and tasks of economic structural reform during the Seventh 5-Year Plan. 5. Vigorously strengthen the building of socialist spiritual civilization.

Wang Chaowen said that to guarantee the fulfillment of the main tasks and targets of the Seventh 5-Year Plan, the province must give play to its strong points, improve [word indistinct] results, lay down a good foundation, and increase reserve strength. Proceeding from the future exploitation of natural resources and readjustment of the production structure, the province must: Vigorously develop agriculture; speed up the development of the energy, communications, and raw materials industries; increase production of consumer goods; speed up scientific and technological advancement and the training of talented people; and expand economic and technological ties with other provinces and foreign countries. The province must treat development in the above five fields as the focus so as to promote the development of the whole economy and the fulfillment of all tasks.

Members attending the 4th meeting of the fifth provincial CPPCC committee attended the opening session as observers. Also attending the session as observers were some deputies to the sixth NPC, and responsible persons from all departments of the provincial CPC committee, the provincial people's congress standing committee, the provincial government; from all Guiyang bureaus of all ministries and commissions under the State Council; and from all higher learning institutes in Guiyang.

The fourth session of the sixth provincial people's congress held its second plenary meeting at the provincial people's government auditorium on the afternoon of 28 April.

The meeting was presided over by Luo Dengyi, executive cyairman of the session.

The participants first listened to a draft report by (Zhou Banghua), director of the provincial planning commission, on the economic and social development plan for the province in 1986.

(Zhou Banghua) said that according to the arrangements in the draft plan, the province's industrial and agricultural output value will increase by 10.07 percent over 1985. The province's GNP for 1986 will increase by 12.4 percent over 1985. The province's national income will increase by 11.3 percent. The fixed assets investment made by enterprises owned by the whole people will reach 1.504 billion yuan.

He said that to ensure the fulfillment of the plan for 1986 and to win the first battle in the Seventh 5-Year Plan, great efforts should be made to firmly grasp the following tasks.

1. Continue in-depth discussions in rural areas on reaping bumper harvests to get rich. 2. Widely hold discussions in industrial enterprises on increasing production and income. 3. Firmly grasp the circulation channel. 4. Vigorously develop horizontal economic ties. 5. Strengthen and improve macroeconomic control.

Then (Long Xinyang), director of the provincial finance department, delivered a draft report to the meeting on the province's final accounts for 1985 and financial budget for 1986.

The province's financial revenue in 1985 was 1.449 billion yuan, and its expenditure 2.387 billion yuan. There was a balance of 294.88 million yuan at the end of 1985, which was the balance between revenues for 1985 plus subsidies granted by the central authorities and the balance carried forward from 1984 on the one hand, and the expenditures for 1985 on the other hand. This balance figure shows a slight increase over that at the end of 1984.

On the province's budget for 1986, (Long Xinyang) said that the principle governing the province's budget for 1986 is to: Act upon financial policies and maintain a steady increase in financial income on the basis of promoting production and improving economic results; act in accordance with the financial system; further perfect various financial and taxation systems and reform measures; continue to support in a planned way and with emphasis, large and medium-sized enterprises in carrying out technical renovation; act according to our capability and give full play to our own abilities; ensure priority projects while taking general ones into consideration; develop education, science and technology; reasonably increase expenditures in subsidizing agricultural production; continue to improve people's livelihoods; and to maintain a balance between revenues and expenditures for 1986.

From 29 April onward, the delegates will discuss and examine in panel groups the three reports given by Wang Chaowen, (Zhou Banghua) and (Long Xinyang). Members attending the fourth session of the fifth provincial CPPCC committee also attended yesterday afternoon's plenary meeting as observers.

Session Concludes

HK080327 Guiyang Guizhou Provincial Service in Mandarin 2200 GMT 7 May 86

[Excerpts] The fourth session of the Sixth Guizhou Provincial People's Congress victoriously concluded in Guiyang on 7 May. The session called on the people of all nationalities to unite closely, display the spirit of the foolish old man, and work in concert to victoriously fulfill the province's

Seventh 5-Year Plan. The closing ceremony was attended by responsible comrades of the provincial CPC committee Hu Jintao, Wang Chaowen, and Ding Tingmo.

The session elected (Zhang Youru) as a replacement member of the provincial people's congress standing committee.

HEBEI CPPCC COMMITTEE MEETING OPENS IN SHIJIAZHUANG

Xing Chongzhi Attends Opening

SK071233 Shijiazhuang HEBEI RIBAO in Chinese 24 Apr 86 p 1

[Excerpts] The Fourth Session of the Fifth Hebei Provincial CPPCC Committee opened ceremoniously in Shijiazhuang, the capital of the province, on 23 April.

The simply decorated, solemn session hall was filled with an atmosphere characterized by democracy and unity. A CPPCC emblem hung at the center of the rostrum with 10 red flags on both sides and fresh flowers and greeen cypress in front.

Yin Zhe, chairman of the provincial CPPCC committee, presided over the opening ceremony.

Party, government, and army leading comrades, including Xing Chongzhi, Xie Feng, Li Wenshann Yang Zejiang, Sun Guozhi, Zhang Chao, Ye Liansong, Lu Chuanzhan, Qu Weizhen, Bai Shi, Liu Ronghui, Chen Yujie, GuoZhi, Yue Zongtai, and Dong Xuelin, attended to extend warm congratulations.

Seated on the rostrum were Xu Chunxing, Zhang Ruolin, Bai Tieshi, Chen Lintang, Ma Zhouzhou, Li Ganliu, Wang Enduo, Ma Xinyun, Liu Zongyao, and Du Jingyi, vice chairmen of the provincial CPPCC committee; and Shi Xizhi, secretary general of the provincial CPPCC committee.

Also invited to today's session were Wang Youhui, Liu Zhenhua, Han Shufan, Liu Kedong, Chang Shouluan, and Jiang Shougui, members of the National CPPCC Committee; and Jia Qiyun, Lu Zhiguo, and Xu Ruilin, former vice chairmen of the provincial CPPCC committee.

At 0900, Yin Zhe declared the session open. All the participants rose when the national anthem was played.

Yin Zhe said in his speech: This session is convened shortly after the conclusion of the Fourth Session of the Sixth NPC and the Fourth Session of the Sixth National CPPCC Committee, and in the excellent situation in which the political situation of the province has become more stable and united, economic construction is developing vigorously, and marked results have been achieved in the reform of various fields. Displaying the spirit of political consultation, democratic supervision, and cooperation in work, this session should hold earnest discussions and consultations on such major issues as the "Seventh 5-Year" Plan of our province, the plan for 1986 national economic and social development, and the building of the two civilizations in order to unify thinking and steps and to make new contributions to the implementation of the "Seventh 5-Year" Plan.

Major items of the agenda of this session are: 1) to hear and discuss the "Report on the Work of the Standing Committee of the Fifth Hebei Provincial CPPCC Committee"; 2) to hear and discuss the "Report on the Situation in the Handling of Motions Since the Third Session of the Fifth Hebei Provincial CPPCC Committee"; 3) to attend as nonvoting delegates the Fourth Session of the Sixth Hebei Provincial People's Congress; and 4) to elect additional Standing Committee members of the provincial CPPCC committee, to elect a new secretary general of the provincial CPPCC committee, and to approve the various resolutions of this Standing Committee.

Entrusted by the Standing Committee of the fifth provincial CPPCC committee, Vice Chairman Xu Chunxing delivered a report on the work of the Standing Committee at the session, and Ma Zhuozhou, vice chairman of the provincial CPPCC committee and chairman of its motions work committee, delivered a report on the situation in the handling of motions since the third session of the fifth provincial CPPCC committee. The session is scheduled to last for 7 days and to conclude on 29 April.

Vice Chairman Gives Report

SK101222 Shijiazhuang HEBEI RIBAO in Chinese 27 Apr 86 pp 1-2

[Excerpts] At the fourth session of the fifth provincial CPPCC committee, which opened on 23 April, Xu Cunxing, vice chairman of the provincial CPPCC dommittee, entrusted by the provincial CPPCC Standing Committee, delivered a work report.

The report states: Since the third session, and under the guidance of the party's principles and policies on the united front work and the leadership of the provincial CPC committee, the provincial CPPCC committee has done a great deal of work and scored certain achievements in promoting the program of building the socialist modernization, achieving a fundamental turn for the better in party style and social morale, and developing the patriotic united front by upholding the principle of conducting reforms, creating something new, continuously opening new fields of work, improving work methods, and upgrading work standards, and thanks to the common effort exerted by all CPPCC members and the staff members of the CPPCC organs.

1. Efforts have been made to exercise the function and power of political consultation and democratic supervision and to be the staff and assistants of the provincial CPC committee.

During the past year, our country has made a start in conducting overall reforms in economic systems with the work emphasis of urban transformation, and has achieved rapid development in this regard. We have also paid attention to relaying the relevant documents of the CPC Central Committee and the provincial CPC committee among the CPPCC members and introducing the development of building the two civilizations in order to enable them to learn as soon as possible about the national and provincial situations in terms of politics and the economy.

After issuing the guiding outline (draft) for 1986 work, the provincial CPC committee and the provincial people's government invited the responsible persons of the provincial CPPCC committee, the democratic parties, and the mass organizations concerned to hold a forum to solicit their opinions. The forum was presided over by Xing Chongzhi, secretary of the provincial CPC committee, and Zhang Shuguang, governor of the province. At the forum, participating comrades, with great political enthusiasm and an earnest and responsible attitude toward the discussion, spoke glowingly of the guiding ideology and main tasks for 1986 work and the conrete measures for continuously pushing forward the program of building the two civilizations, and submitted their opinions for amendments, of which some important opinions and proprosals have been acceopted.

In dealing with motions offered by the members, we have created a new work situation in which motions submitted by the members are many, the speed of handling the motions is rapid, and the results scored in disposition of motions are good. During the period from the third session of the fifth provincial CPPCC committee to March 1986, we received 585 motions offered by the members. The number of motions was greater than before, and the quality of the motions was higher than before. As of 15 March this year, we dealt with and responded to 570 motions, which accounted for 97.4 percent of the total number of motions that deserved to be handled. Thus, we better fulfilled the task of dealing with the motions during the period.

The opinions and proposals offered by the CPPCC members with regard to the province's major policies have drawn great attention from the departments concerned under the provincial CPC committee and the provincial people's government.

During the past year, the provincial CPC committee has also further strengthened leadership over the CPPCC work. In mid-February this year, the provincial CPC standing committee heard the report given by the leading party group under the provincial CPPCC committee with regard to a summation of 1985 work and the major outline of 1986 work. The standing committee also acknowledged the achievements and experience gained by the fifth provincial CPPCC committee during the past 3 years and offered its opinions for continuously advancing the CPPCC work.

2. Efforts have been made to bring into play the CPPCC strong point of being a galaxy of talent, and to serve the drives of conducting reforms and building the two civilizations.

In order to organize and enable the members and the personages of various circles with whom the members have set up close ties to actively suggest ways and means and to make contributions to the program of building the four modernizations, members of the provincial CPPCC committee and the work groups under it have conducted special investigations and held special discussions in line with the important issues of concern to the masses, such as systematic reforms, economic construction, and culture and education. They have also offered their opinions and proposals to the provincial CPC committee and the provincial people's government with regard to promoting what is beneficial and abolishing what is harmful.

In mid-January this year, the provincial and Shijiazhuan City CPPCC committees jointly organized an inspection group to carry out an inspection of the cultural and book markets, dance halls, and theaters throughout the capital of the province. They found that the market style was characterized by poor management, that illegal tabloids and publications with fantastic and vulgar content were still sold and lent, and that dance halls and theaters were poor in terms of both management and order. In particular, dance halls perpetuated malpractices and overly indulged in business dealings. All of these have violated the provisions issued by the central departments concerned.

By bearing in mind their professional work and proceeding from the current need for conducting reforms and economic construction, various work groups have held many discussions on specific topics. In November 1985, the educational work group held a special forum on conducting reforms in educational systems, at which participants offered their proposals on the issues of improving leadership over education, strengthening scientific research forces, dealing with the shortage of funds and teachers, and conducting reforms in managerial systems in order to cope with the problems cropping up in vocational and technical education while conducting educational reforms. In January of this year, the group held a discussion and offered proposals for amendments to the "temporary (draft) provisions" on enforcing the 9-year compulsory education throughout Hebei Province.

3. Efforts have been made to enhance the propaganda and liaison work to Taiwan and foreign countries and to carry out the people's diplomatic activities.

In order to help the CPPCC members, the staff members of the work commission in charge of reunifying the motherland, and the personages of circles concerned further understand the party's principles and policies on Taiwan and foreign countries, we have held many report meetings on the situation regarding the policy toward Taiwan and foreign countries and also held a forum to study the grand policy on "one country with two systems." In 1985 we wrote almost 100 propaganda articles on foreign policies, of which 42 were adopted by journalist units.

4. Efforts have been made to carry forward the spirit of conducting reforms and creating something new and to do a good job in compiling the historical accounts of past events.

In order to meet the needs of the development of the situation and to enable the work of compiling the historical accounts of past events to better serve the program of building socialist spiritual civilization, we have made all-out efforts to improve the methods of collecting and compiling the historical accounts of past events by displaying the spirit of conducting reforms and creating something new. In 1985 we published three volumes of the "Selected Works of Hebei Provincial Historical Accounts of Past Events."

5. Efforts have been made to enhance guidance and contract with the CPPCC committees at the city and county levels and to create a new situation in the CPPCC work throughout the province.

In July 1985, we made an on-the-spot investigation of the CPPCC work in Qinhuangdao City and the two counties under the city. In early and mid-September 1985, we and the United Front Work Department under the provincial CPC committee jointly organized 7 investigation groups participated in by the chairman or vice chairmen of the provincial CPPCC committee, and a number of cadres at the section level, to go to 8 provincial-level cities (1 city level district), and 30 counties of the 9 prefectures to investigate or learn about the service rendered by the CPPCC work to the program of building the two civilizations. They held extensive discussions with the CPPCC comrades at the grassroots level units on some questions with universal applicability and helped them sum up their experience and discover some typical cases with specific characteristics. In mid-December 1985, on the basis of making full preparations, we held the second experience-exchange meeting on the CPPCC work at city and county levels to sum up and exchange the methods and experience gained by the CPPCC committees at city and county levels in carrying out the CPPCC work in an all-around way under the leadership of the party committees at all levels by concentrating on rendering service to the program of building the four modernizations, and bringing into play the CPPCC function of political consultation and democratic supervision and the CPPCC strong point of being a galaxy of talent.

In his work report, Xu Cunxing stated: The year, 1986, is the first one in fulfilling the Seventh 5-Year Plan in an overall way. In line with the demand set forth by the provincial CPC committee, the emphasis of the CPPCC work is to help the party and the governments implement the "Seventh 5-Year Plan," and to pay much attention to the programs of conducting reforms and building socialist spiritual civilization while continuously doing a good job in grasping economic construction. The details of these tasks are as follows:

1. Continuous efforts should be made to unclog the channels of political consultation and to enrich the content of consultations in order to better bring into play the function and power of the CPPCC committees.

2. Efforts should be made to further bring into play the CPPCC strong point of being a galaxy of talent and to put forth their wisdom and strength in line with the provincial Seventh 5-Year Plan and the central tasks of the provincial CPC committee and the provincial people's government.

3. Efforts should be made to regard as an important task of the CPPCC committees the work of helping the party and the governments enhance the building of spiritual civilization. In straightening out party style and combating evil social morale, efforts should be made to bring into play the CPPCC role of democratic supervision, to boldly expose the problems in this regard, and to conduct criticism against the evil trends and offer proposals for improvement.

4. Efforts should be made to frequently organize the CPPCC members and the social personages in a timely manner to carry out study activities, to continuously carry forward the fine tradition of the people's political consultations, and to voluntarily study Marxism-Leninism-Mao Zedong Thought and current politics in order to enhance self-education and self-improvement.

5. By continuously holding high the patritoic banner, efforts should be made to strengthen the contact between the CPPCC members compatriots," and to expand the patriotic united front through their extensive contacts and friendly activities.

6. Efforts should be made to further invigorate the work of collecting and compiling the historical accounts of past events.

7. Efforts should be made to earnestly implement the spirit of the forum sponsored by the National CPPCC Committee with regard to local CPPCC work, to assist the United Front Work Department under the provincial CPC committee to further strengthen the guidance and contacts with the CPPCC committees at city and county levels, and to study and discuss the CPPCC problems with universal applicability in order to help the CPPCC committees at city and county levels sum up their experience, carry forward their achievements, and further create a new situation in work.

8. Efforts should be made to deeply conduct propaganda work and education on the theories and policies concerning the united front work. We should make concerted efforts with the United Front Work Department under the provincial CPC committee in organizing the forces of various circles to carry out research concerning the theories and policies of the united front work and to convene the provincial seminar on theories of the united front work. By making use of mass media, such as newspapers and radio and television broadcasting stations, efforts should be made to extensively publicize the character, position, and role of the CPPCC committees in the new historical period and to expand the CPPCC influence among the people.

9. Efforts should be made to have the CPPCC organs vigorously carry out building ideologically and organizationally in order to strive to achieve a fundamental turn for the better in party style and in organizational work style within the year and to strive to create civilized units.

REPORTAGE ON JIANGXI CPPCC SESSION IN NANCHANG

Session Hears Reports

OW060317 Nanchang Jiangxi Provincial Service in Mandarin 1000 GMT 4 May 86

[Excerpts] The Fourth Session of the Fifth Jiangxi Provincial CPPCC Committee held a second plenary meeting this afternoon to hear a report by Shen Hanqing, vice chairman of the provincial CPPCC committee, relaying the guidelines of the Fourth Session of the Sixth CPPCC National Committee, and one by Wu Yunzhong, vice chairman of the provincial CPPCC committees, on the guidelines of the National Forum on Local CPPCC Work. Executive chairmen of today's session were Lu Ziaopeng, Lu Liang, and Li Shanyuan.

Vice chairmen of the provincial CPPCC committee, including Yang Yongfeng, Liu Jianhua, Wu Yongle, Wu Tiyu, and Jin Liqianga were present.

CPPCC Meeting Ends

OW101736 Nanchang Jiangxi Provincial Service in Mandarin 1000 GMT 9 May 86

[Excerpts] After completing all the tasks specified in its agenda, the fourth session of the fifth Jiangxi Provincial CPPCC Committee closed at the Zhongshan Hall in Nanchang this afternoon.

Today's meeting was jointly chaired by Yang Yongfeng, Liu Jianhua, and Wu Tiyu, vice chairmen of the provincial CPPCC committee. Seated at the rostrum were Wu Ping, chairman of the provincial CPPCC committee; Liu Xiaopeng, Shen Hanqing, Lu Liang, Li Shanyuan, Wu Yongle, Jin Liqiang, and Wu Yunzhong, vice chairmen of the provincial CPPCC committee; and members of the Standing Committee of the provincial CPPCC committee.

Attending the meeting by invitation were Xu Qin, Zhao Zengyi, Wang Shufeng, Zhu Zhihong, (Lin Yisheng), (Liu Zhonghou), Zhao Zhijian, (Chen Guidun), Fang Qian, Laio Shaoyao, Ni Nanshan, Zhu Danhua, and (Gui Siuying), who extended their congratulations on the closing of the Fourth Session of the Fifth Provincial CPPCC Committee.

At 1500 Yang Yongfeng declared the meeting open.

The first item on the agenda was to elect the additional members of the Standing Committee of the Fifth Jiangxi Provincial CPPCC Committee. By a show of hands, the meeting elected (Li Peiyao), (Qiu Weiyang), (Kang Kuangshi), (Yang Xiaochun), (Guo Kemi), and (Zhu Guohua) as members of the Standing Committee.

The meeting urged CPPCC organizations and members throughout the province to rally more closely under the leadership of the Jiangxi Provincial CPP Committee, display the pioneering spirit of waging hard struggle and of the foolish old man in moving the mountain, carry forward the fine traditions of the CPPCC, advance in a down-to-earth manner, and make concerted efforts to fulfill our province's Seventh 5-Year Plan. The meeting also approved a report on the examination of the motions submitted to the Fourth Session of the Fifth Provincial CPPCC Committee.

NI XIANCE DISCUSSES JIANGXI'S 7TH 5-YEAR PLAN

OW071451 Nanchang Jiangxi Provincial Service in Mandarin 1000 GMT 6 May 86

[Text] In his report to the Fourth Session of the Sixth Jiangxi Provincial People's Congress, Governor Ni Xiance set forth the guiding thought, goals, and basic tasks of our province's Seventh 5-Year Plan.

Ni Xiance said: The overall guiding thought for our province's Seventh 5-Year Plan was spelled out for us by Comrade Hu Yaobang, who said that Jiangxi should strive to accelerate its economic development at a slightly higher speed than the nation's average, and should go a step further in invigorating the economy and opening to the outside world. The goals in economic and social development for the period of the Seventh 5-Year Plan are as follows: To strive to basically complete the foundation of a socialist economic system with Chinese characteristics and full of life and vigor, and to vigorously promote science and technology and exploit intellectual resources. By 1990, while economic results are constantly improved, total agricultural and industrial output value shall reach 43 billion yuan and the gross provincial product 34.4 billion yuan, both more than double the figures for 1980; the major indexes of economic results in industry shall approach the nation's average; local financial revenue shall reach 3.5 billion yuan; the per capita consumption level of urban and rural residents shall grow about 45 percent as compared to 1985; the living standards of people in the old revolutionary base areas shall show marked improvement; and there shall be further improvement in the quality of life and in the living environment and in living conditions.

Ni Xiance emphasized that, in order to realize the goals set for the period of the seventh 5-year plan, the following eight guiding principles must be followed: 1. Persist in placing reform above everything else, correctly handle the relationship between reform and construction, and make sure that total social demand and supply are basically balanced so that reform and construction can adapt to and promote each other. 2. Make persistent efforts to open to the outside world with still bolder steps. Promote international economic and technological cooperation and exchange as well as lateral economic ties. Through such endeavors, make active use of capital, technologies, talented people, and management experience from overseas and from other parts of the country and apply them in exploiting our province's rich resources and speeding up our province's economic development. 3. Persist in focusing attention on improving economic results in all aspects of economic work, give prominence to improving product quality and reducing material consumption, find out and decide what economic growth rate is best suitable to the actual conditions in our province, and promite a proportionate and efficient development of the economy. 4. Persist in vigorous development of the rural economy with development of agriculture as the foundation, and make efforts to lengthening the two short legs of diversified agricultural production and village and town enterprises. 5. Persist in promoting science and technology and exploiting intellectual resources with the understanding that it is of strategic importance, and speed up development of undertakings in science and technology and in education. 6. Adhere to the principle of concentrating construction efforts mainly on technical renovation, reconstruction, and expansion of existing enterprises. Fix the scale of investment in accordance with the state plan, step up technical renovation of enterprises, and accelerate construction of energy, transport, telecommunications, and raw materials projects. 7. Persist in efforts to improve the material and cultural life of people in urban and rural areas on the basis of developing production and increasing labor productivity, correctly handle the relationship between developing production and improving people's living standards, and continue to carry forward the traditional spirit of hard struggle and building up the country through thrift and hard work in all undertakings. 8. Persist in simultaneously promoting material and spiritual civilization. While building socialist material civilization, efforts should be made to attain a high degree of socialist spiritual civilization.

Ni Xiance said: Agriculture is the foundation of the national economy. We must further restructure production in the rural areas to bring about allround invigoration of the rural economy. This will be the emphasis of the entire economic work during the Seventh 5-Year Plan. It is also the key to ensuring steady growth of the economy of the whole province. We must further restructure industry by appropriately speeding up development of the consumer goods industry, stepping up construction of the energy and raw materials industries, and developing the machine-building, electronic, and other industries in order to achieve an industrial structure with Jiangxi's characteristics. We must gradually correct the imbalance between tertiary industry and primary and secondary industries, concentrate attention on the construction of transport and telecommunications projects and the development of commercial service and tourist industries, and see to it that the growth of output value of tertiary industry will exceed the growth in value of the gross provincial product.

Ni Xiance said: During the Seventh 5-Year Plan period, we must pay attention to education as much as we do to economic construction, and must realize that it is of strategic importance to promoting science and technology. This is a fundamental task which affects the whole situation will bring about a considerable improvement in education and science in the province. In developing science and technology, emphasis should be placed on serving economic construction, particularly on tackling key economic projects with potentially high economic results. In education, it is necessary to act in accordance with the principle of meeting the needs of modernization, the world, and the future by developing schools of various branches of learning at various levels in a coordinated and balanced manner and greatly enhancing our capability to train competent personnel. Effective measures should be taken to make competent personnel want to stay, to lure talented people to our province and make reasonable use of them, and to build a contingent of scientists and engineers with fairly high qualifications.

Ni Xiance pointed out: In developing the economy in the old revolutionary base areas, it is necessary to rely mainly on local resources and to aim at achieving common prosperity. The emphasis of our work should be on helping the people in these areas to find ways to shake themselves free from poverty and become well off and to solve the problem of sufficiency in food and clothing. To enable the old revolutionary base areas rid themselves of backwardness, it is necessary to implement the principle of relying on local resources, promoting coordinated efforts by the various departments, and using state support while achieving invigoration through joint efforts and further relaxing policy controls so as to enhance the vitality of these areas. Support from all trades and departments is needed to invigorate the economy of the old revolutionary base areas. We must mobilize and organize all the forces of society to support construction in these areas at various levels, through various channels, and in various forms.

Ni Xiance stressed: During the Seventh 5-Year Plan period, we must make further efforts to open still wider to the outside world, in every direction, and with even bolder steps. We must develop foreign trade, use foreign capital, and import technologies on a much wider scale. At the same time, active efforts must be made to develop tourism as well as cooperation with foreign countries in construction and labor service projects. In opening to the outside world, we must pay attention to exports as well as imports. The essential thing in expanding efforts to attract capital and technology is that we must be able to increase exports and earn more foreign exchange. We must make full use of the capital and the talented people we obtain from other provinces and step up the transfer of advanced technologies from the coastal areas to our province in order to renovate enterprises and develop our province's resources.

Ni Xiance said: The most important and fundamental guiding principle for economic and social development during the Seventh 5-Year Plan period is to persist in giving first place to reform and make active and careful efforts to push all reforms. This is the key to successful fulfillment of the construction tasks set for the Seventh 5-Year Plan period. There are three main aspects in economic structural reform during this period. First, we must further invigorate enterprises, espeically big and medium-sized ones. Second, we must make further efforts to develop the socialist commodity market and gradually improve the market system under the guidance of the state plan. Third, we must step up and perfect our macroeconomic management system and perfect our means of regulation.

An important factor in restructuring the economic system during the next 5-year period is to promote lateral economic ties by stressing the work in the following six areas: 1) We will actively promote ties with regions and enterprises which are financially sound and technologically strong so that we can attract their capital and technology. 2) We will organize all kinds of joint enterprises, such as production and marekting enterprises, by coordinating the operation of large and medium-sized mainstream manufacturers with small manufacturers to produce quality goods. 3) We will organize joint enterprises that handle on their own production, supply, and marketing of agricultural and sideline products as well as industrial goods in accordance with the natural flow of commodities so that new forms of commercial operations combining agriculture, industry and commerce can be gradually established. 4) We will gradually centralize heat and gas supply in cities where industries are relatively concentrated, and we will gradually promote specialized production in areas where operation among manufactuers can be centralized. 5) As the enterprises and research organs of of Jaingxi's defense industry are technologically strong and well equipped, we will promote joint military-civilian undertakings and accelerate the transfer of military technology to the civilian sector. 6) We will ensure that industrial enterprises in cities will expand toward surrounding suburbs and counties. By branching out, they should help promote the growth of rural enterprises. In particular, they should help promote economic growth in the old revolutionary areas by intensifying economic and technical assistance to their counterparts in these areas.

Ni Xiance stressed: During the next 5-year period, we must consider our consumption needs, as well as the needs of production and contruction, and maintain a proper proportion between accumulation and consumption. On the basis of promoting production and increasing national income, we should continue to improve the people's living standards. We should, in accordance with the state's centralized planning, improve the distribution of income among the people and continue to uphold the policy of letting some people become affluent ahead of others. While we must exert efforts to combat egalitarianism, we must guard against irrational and excessive dispartiy of income between workers in our enterprises and people in society as a whole. We must firmly stop the conduct of competing with each other in raising pay, increasing benefits, and issuing bonuses in cash or in kind, and intensify the work of properly guiding people on consumption. We must attach great importance to planned parenthood and continue to act firmly in controlling population growth.

Ni Xiance said: During the next 5 years, we must intensify the implementation of socialist laws while expediting reforms and construction, and our material construction must proceed hand in hand with spiritual construction so that our socialist modernization program can be smoothly carried.

JILIN HOLDS PEOPLE'S CONGRESS STANDING COMMITTEE MEETING

Major Agenda Items Listed

SK070606 Changchun Jilin Provincial Service in Mandarin 0930 GMT 6 May 86

[Excerpts] The 19th standing committee meeting of the 6th provincial people's congress was held in Changchun City on 6 May. The major agenda items of the meeting were to relay and study the spirit of the Fourth Session of the Sixth NPC, to discuss the draft resolution on studying and implementing the spirit of the session, to examine and discuss the provincial draft provisions on forest management and the draft provisions on economic contract management, to discuss the draft resolution on putting an end to the two local laws and regulations, to hear and discuss the report given by the provincial people's government with regard to the implementation of the PRC accounting law and the report on conducting reforms in scientific and technological systems throughout the province, and to examine and discuss the draft plan formulated by the provincial electoral committee with regard to electing next term deputies at county and township levels.

Huo Minguang, vice chairman of the provincial people's congress standing committee, presided over the plenum of the meeting on 6 May. At the plenum, Chairman Zhao Xiu delivered a speech, in which he relayed the spirit of the Fourth Session of the Sixth NPC.

At the meeting, Zhu Jinghang, vice chairman of the provincial people's congress standing committee, delivered a speech, in which he spoke enthusiastically of his personal understanding gained from the Fourth NPC session.

Attending the meeting were vice chairmen of the provincial people's congress standing committee, including Liu Cikai, Cui Lin, Wang Jiren, Yu Ruihuang, Dong Su, Renqinzhamusu, and Xu Yuancun.

Attending the meeting as observers were Wang Jinshan, vice governor of the province; Li Xiangwu, chief procurator of the provincial people's procuratorate; and responsible comrades from the provincial higher people's court, the departments concerned under the provincial people's government, and from the offices at all levels of the standing committees of city or autonomous prefectural people's congresses.

Meeting Concludes

SK140854 Changchun Jilin Provincial Service in Mandarin 0930 GMT 13 May 86

[Excerpts] The 8-day 19th standing committee meeting of the 6th Jilin Provincial People's Congress ended in Changchun today. The meeting called on the people of various nationalities throughout the province to work in unity and with one heart and one soul under the leadership of the provincial CPC committee, to display the spirit of the foolish old man who moved the mountain while doing pioneering work, to actively participate in the great practice of the Seventh 5-Year Plan, and to strive to successfully fulfill all tasks during the province's Seventh 5-Year Plan period.

Zhao Xiu, chairman of the provincial people's congress tanding committee, presided over this afternoon's plenary meeting. At the meeting the participants unanimously adopted a resolution of the provincial people's congress standing committee on conscientiously studying and implementing the guidelines of the Fourth Session of the Sixth NPC.

This afternoon's plenary meeting also adopted the Jilin provincial provisions on economic contract management, a resolution of the provincial people's congress standing committee on putting an end to the provisional regulations of the Jilin Provincial People's Government on placing minor criminals and violators of law under social supervision and management and on conducting education among them, and a resolution of the provincial people's congress standing committee on putting an end to the provisional regulations of Jilin Province on levying and managing the civil lawsuits fees. The meeting also adopted a plan of the Jilin Provincial Electoral Committee on electing next term deputies at the county and township levels, and a namelist of the appointments and dismissals of personnel.

Attending the meeting were vice chairmen of the provincial people's congress standing committee, including Huo Mingguang, Liu Cikai, Cheng Shengsan, Cui Lin, Wang Jiren, Yu Ruihuang, Dong Su, Renqinzhamusu, Zhu Jinghang, and Xu Yuancun. Li Xiangwu, chief procurator of the provincial people's procuratorate, and the responsible persons of the provincial higher people's court, the relevant provincial government departments, the various city and autonomous prefectural people's congress standing committee, and the Baicheng office attended the meeting as observers.

NEI MONGGOL'S BU HE DISCUSSES SEVENTH 5-YEAR PLAN

SK020413 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 1 May 86

[Text] In his report on the draft Seventh 5-Year Plan, Chairman Bu He said: In order to fulfill the basic tasks of the Seventh 5-Year Plan, we should adopt the following strategic measures:

1. We should continue to enhance our understanding, and persistently place reform in the first place. We should correctly understand and handle the relationship between reform and construction, further readjust production relations to make them suit and promote the development of productive forces, effect a change of the old economic system into a new one, and basically establish a foundation for a socialist economic system with Chinese characteristics, and full of vitality and vigor. Governments and leading persons at all levels should unify their understanding of the protractedness, complexity, and importance of reform, and resolve, through reform, all the unavoidable contradictions and difficulties cropping up in the course of reform. They should never let their faith in reform be shaken no matter what difficulties and complications they encounter, nor should they turn back to the old road whenever difficulties arise. As has been proved in practice, there will be no way out if we turn back.

2. We should continue to thoroughly implement the principle of developing diverse undertakings with the focus on forestry and animal husbandry, and further carry out the various infrastructure for agriculture successfully. Agriculture is the foundation of the national economy, and grain is the foundation of the foundation. Never at any moment should we deviate from this idea. Upholding the principle of greatly developing animal husbandry is of great political and economic significance. The general requirement is to attach equal importance to quantity and quality, to develop production and management at the same pace, to take both cropping and pastoral areas into consideration, to raise both plant-eating animals and omnivorous animals simultaneously, and to bring the production level and economic results of our region's animal husbandry up to a new stage. The key to readjusting the production setup of the rural and pastoral areas is that we should, first, continue to plant trees and grass persistently with great efforts, and guarantee a stable development in the quality of tree and grass planting; and second, continue to develop township enterprises vigorously, give play to the role of local advantage in resources, and make our products readily

marketable. Through the development of township enterprises and the operation of rural industries to support agricultural production, we should gradually establish, in the rural areas, an operational system of coordinated production, processing and marketing.

3. We should strengthen and improve the macroeconomic control, and further bring into balance the relations among the various sectors of the national economy. We should gradually combine the role of planning with that of market, and the microeconomic flexibility with macroeconomic control, and gradually perfect the various economic and legal means, and supplement them with necessary administrative means in order to control and regulate the operation of the economy, and reorient the economic development toward a new track. In the meantime, we should make a success of the coordinated reforms of planning, prices, and wages, and blaze a new road in which the macroeconomic control system coordinates well with the microeconomic self-regulating mechanism.

4. We should make a breakthrough in weak links, and enhance our reserve strength in economic development. In our region, the economic foundation is rather weak, and there are many factors restricting the economic development. At present and for some time to come, the [words indistinct] are: 1) The strained transportation and communications; 2) a lack of talented people; and 3) a serious shortage of funds. During the Seventh 5-Year Plan period, we should exert great efforts to achieve breakthroughs in these three aspects through reform, planning, and construction, and make [word indistinct] preparations for the overall economic and social development in the 1990's.

5. We should greatly expand lateral economic contacts, and establish a crisscross and vigorous economic network. The general idea is the cooperation between southern and northern parts of the region, the exchange between the eastern and western parts of the region, the introduction of investment from abroad and the establishment of lateral ties at home, and the mutual support between the urban and rural areas. The cooperation between the southern and the northern parts means the cooperation between cropping and pastoral areas, and the full play of the role of grain in the southern part of the region, and the role of animal husbandry in the northern part of the region. The exchange between the eastern and the western parts means to strengthen the association, cooperation and ties between the two economic areas in the eastern and the western parts of our region. The establishment of lateral ties at home and the introduction of investment from abroad means the implementation of an open strategy to develop lateral economic ties in both quality and range. The mutual support between the urban and the rural areas represents a new task for economic development in the new situation. We should make the best use of the situation, pay attention to the performance of the radiative functions of central cities, and, through joint operation, technology transfer, and labor division and cooperation, realize common prosperity of the urban and the rural areas with the former leading the latter, and the latter supporting the former. In the meantime, we should further do a good job in the reform and construction of small market

towns, further expand the exchanges and contacts between the urban and the rural areas, and enable the urban and the rural economies to infiltrate, supplement, and support each other, and enable industry, agriculture and animal husbandry to develop in a coordinated manner.

6. We should strengthen leadership, improve our workstyles, and upgrade the government work to a new level.

WORK REPORT OF NEI MONGGOL PEOPLE'S CONGRESS STANDING COMMITTEE

SK100354 Hohhot Nei Monggol Regional Service in Mandarin 1000 GMT 8 May 86

[Work report of the regional people's congress standing committee delivered by Batubagen, chairman of the regional people's congress standing committee, at the fourth session of the sixth regional people's congress--with portions recorded]

[Text] [Begin recording] Fellow deputies:

Entrusted by the regional people's congress standing committee, I hereby make a report on the work of the standing committee since the third session of the sixth regional people's congress. Since the third session of the sixth regional people's congress, the standing committee has conscientiously implemented the guidelines of the Third Session of the Sixth NPC and the national conference of party delegates, has conscientiously studied the resolutions adopted by the third session of the sixth regional people's congress, has grasped the legislation and supervision work focusing on the economic structural reform and the modernization drive, has performed the rights entrusted by the Constitution, the local administrative laws, and the laws on the regional national autonomy, and has exploited the role of the local state power organs. [end recording]

Chairman Batubagen reported the work, in its four aspects, done by the standing committee since the third session of the sixth regional people's congress. First, it has grasped the local legislation work focusing on the economic and national legislation. Second, it has strengthened the supervision over the local state administrative organs, the judicial organs, and the procuratorial organs centering on the building of the two civilizations. Third, through organizing the people's deputies to conduct investigations and through conscientious handling of motions raised by the deputies, [words indistinct]. Fourth, it has further strengthened the contacts with the people's congress standing committees of various cities, banners, counties, and districts.

[Begin recording] Fellow deputies, since the third session of the sixth regional people's congress, the work of the regional people's congress standing committee has been developed continually and soundly in our course of conscientiously implementing the Constitution, the local administrative laws, and the laws on the regional national autonomy. However, our work still falls short of the standards stipulated by the laws and the people's demands. We should constantly sum up experiences and strive to improve our work. The year 1986 is the first year of the Seventh 5-Year Plan as well as a year for consolidating, digesting, supplementing, and improving our achievements. The regional people's congress standing committee should grasp construction with one hand, and the legal system and the guiding ideology with the other hand; should conscientiously implement the guidelines of the national conference of party delegates and the Third Session of the Sixth NPC; should vigorously strengthen with one heart and one mind the socialist democracy, perfect the socialist legal system, strengthen national legislation, economic legislation, and supervision over the laws; and should make great efforts to ensure a smooth development of the regional economic structural reform and the socialist modernization drive, and to ensure the fulfillment of the region's Seventh 5-Year Plan. [End recording]

PROVINCIAL AFFAIRS

WANG LINZHONG REPORTS ON NEI MONGGOL PROCURATORIAL WORK

SK101102 Hohhot Nei Monggol Regional Service in Mandarin 1000 GMT 8 May 86

[Text] In his work report to the fourth session of the sixth regional people's congress, Wang Linzhong, chief procurator of the regional people's procuratorate, said: Since the beginning of last year, procuratorial organs at all levels throughout the region have subjected themselves to the guidance of the guidelines of the 3d Plenary Session of the 12th CPC Central Committee and the National Conference of Party Delegates; have developed their professional work in line with the guiding ideology of submitting themselves to and serving the party's general tasks and goals, the principle of opening to the outside world and invigorating the domestic economy, and the policy decisions for the economic structural reform; and have made fresh headway and scored remarkable achievements in dealing strict blows to serious criminal and economic crimes, in protecting the citizens' personal and democratic rights, in striving for a fundamental improvement in public security, and in protecting and promoting the reform and construction programs.

In his report, Chief Procurator Wang Linzhong pointed out: In 1986 we should regard as the guiding ideology Comrade Deng Xiaoping's important instruction on grasping construction with one hand and grasping the legal system with the other hand, should continue to deal blows to serious criminal offenses in line with the principle of dealing with criminal offenses severely and promptly according to the law, and should effect a stable improvement in public security on the basis of effecting a remarkable improvement in it. In addition, we should comprehensively carry out all items of the procuratorial work, centering on dealing blows to serious economic crimes.

Chief Procurator Wang Linzhong said: Strengthening the self-construction of the procuratorial organs is of great significance in building a democratic society characterized with a legal system, in safeguarding the dignity of the Constitution and the laws, and in penetratingly conducting the campaigns of dealing blows to serious criminal offenses and economic crimes. At present, we should vigorously intensify the ideological and political work, should administer the police in a strict manner, should attend to the training work to improve the competence of cadres and policemen, and should make new contributions to stepping up the democratic dictatorship by the people and safeguarding and promoting the economic reform, the open policy, and the four modernizations.

NINGXIA SECRETARY'S SPEECH TO PROVINCIAL CONGRESS

HK160437 Yinchuan NINGXIA RIBAO in Chinese 30 Apr 86 pp 1, 2

["Excerpts of Li Xuezhi's Speech to Fourth Session of Fifth Ningxia People's Congress"]

[Text] Comrades:

The current sessions of the regional people's congress and CPPCC are a complete success. These two sessions are the sessions for drafting our strategic plan and presenting a grand blueprint, carrying forward the revolutionary cause and forging ahead into the future, and triumphantly fulfulling the tasks enumerated in the Seventh 5-Year Plan. They will inevitably exert a tremendous influence over Ningxia's political, economic, and social life and give impetus to the development of various undertakings. At the sessions, the delegates and members have made many useful and constructive proposals which have enlightened us and promoted our work. On behalf of the regional CPC committee, let me take this opportunity to express my heartfelt thanks to the delegates to the people's congress and members of the CPPCC who have contributed to the building of Ningxia's spiritual and material civilizations.

Now I would like to present some views on the Seventh 5-Year Plan.

I. Reform Is the Central Task of the Seventh 5-Year Plan Which Should Be Carried on Through To the End

Reform is the only way out for China's four modernizations and the bridge leading to national revitalization. Besides reform, there is no other way out for China as well as Ningxia. It is a distinctive characteristic of the Seventh 5-Year Plan to put the overall reform of the economic structure in the first place. Comrade Xiaoping said that the central task of the Seventh 5-Year Plan is reform. They key to satisfactorily accomplishing the constrution tasks during the Seventh 5-Year Plan period, maintaining a sustained, steady, and coordinated development of the economy, and preserving the necessary reserve strength for the continuous economic and social development during the 1990's [word indistinct] in reform.

In recent years, Ningxia has made explorations and great efforts on reform. We have achieved remarkable successes in rural reform and gained initial results in urban reform. Reform has invigorated our urban and rural economies, brought for the gratifying changes in the people's lives and mental attitude, enlisted extensive support from the masses, and become an irresistable historical trend giving impetus to economic development and social progress.

The going reform is an extensive, profound revolution. It intends to reform the old economic pattern and establish a new economic system with Chinese characteristics. The substitution of the old system for a new one covers an extremely arduous and complicated process which may give rise to certain frictions and conflicts. We must have a correct understanding of the problems emerging in reform rather than complain about or negate reform or waver in our confidence in reform, still less should we attribute the current unhealthy tendencies to reform. The solution to the problems of reform can be found only through the course of the deepgoing process and perfection of reform. In this regard, to be at a standstill or slip back to the beaten track will not work. While old problems are constantly being solved, new problems will constantly raise. Therefore, we must make a study of the new situation, solve new problems, accumulate new experiences, and push reform forward. The mistakes made in exploration and reform should be strictly differentiated from the practices that take advantage of reform to engage in unhealthy tendencies. We must resolutely curb unhealthy tendencies and courageously carry out reform. We must protect, support, and help the reformers. In recent years, a large number of pioneers in Ningxia have enthusiastically plunged themselves into the reform. With the spirit of forging ahead and the courage to think, act, and make explorations, they have made great contributions to the development of Ningxia's reform and economic construction. Although some of them may have shortcomings and even make mistakes in work, we should never negate their achievements and spirit of reform. Regarding the reformers who have chosen the correct path and advanced with big strides but have encountered numerous obstacles; we should share their burdens and help them tide over their difficulties. With regard to the reformers who have attained marked successes in reform and also made mistakes, we should affirm their achievements as well as seriously carry out criticisms and help them correct their mistakes. As to the reformers who have suffered setbacks and even failures due to lack of experience, we should enthusiastically help them sum up experience, boost their morale, and encourage them to forge ahead. We must resolutely investigate and deal with those who take advantage of reform to seek private gains and who violate laws and discipline. Regarding those who stick to old ways and who are good only at making indiscreet remarks, spreading rumors, and laying obstacles to reform rather than doing practical work, we should spare no time to carry out criticisms and education.

Developing lateral economic ties constitutes an important part of the reform of the economic structure. It will be of far-reaching impact to the exploitation of natural resources and rational use of funds, the circulation of commodities and establishment of a unified socialist market, technological progress and rational exchange of qualified personnel, rationalization of the economic structure and regional distribution, elimination of the barriers erected between regions and departments, and the reform of the economic structure and the socialist modernization program. Facts have proved that lateral economic ties can bring forth better results, productive forces, and qualified personnel which are beneficial to both sides and society.

Ningxia has done a great deal of work recently in developing lateral economic ties and has achieved fairly good results. We must keep abreast of the current situation, enthusiastically support the lateral economic ties of various forms, earnestly solve the problems arising from the work, and create favorable conditions in policies and laws for the development of lateral economic ties.

While developing lateral economic ties, we should adhere to the progress. As Ningxia's conditions are relatively poor in many fields, it is our common aspiration to invite investment, technology, equipment, and qualified personenl from other provinces and regions by means of lateral economic ties so as to rationally distribute the various production factors of enterprises and benefit them. However, as two parties are related in the development of lateral economic ties, we should not merely think of the petty, immediate advantages to ourselves or expect for big advantages immediately after developing lateral economic ties. We should take the overall situation into account, have our eyes on the future, adopt preferential and effective policies and measures, and vigorously develop lateral economic ties.

The 5 years' work depends on a good start in the first year. The year 1986 is the first year of the Seventh 5-Year Plan. From the very beginning of the plan, we should grasp our work firmly and in a down-to-earth manner and maintain the overall balance of the national economy so that the national economy will increase at an appropriate rate and will develop in a sustained, steady, and coordinated manner. We should think more of the difficulties and complicated matters, predict the problems that may arise, and work out counter measures to deal with them.

Agriculture is the foundation of the national economy. We must seriously implement central document No 1 and the spirit of the regional rural work conference and earnestly grasp this year's agricultural production. The various measures to increase production should be carried out to ensure the steady growth of grain production. We must further readjust the production setup, vigorously develop a diversified economy, and build well the bases for commodity production. We must help town and township enterprises solve their difficulties in information, funds, technology, and marketing and support and give impetus to the further development of town and township enterprises.

We must pay close attention to industrial production. It is necessary to further improve enterprise management, cut down production costs and consumption, improve the quality of products, solve the problems of shortage of raw materials and floating capital and of certain unsalable goods, and ensure the normal operation of production. We must continue to do well the work of turning deficits into profits. Regarding the enterprises whose economic results are poor and that have suffered deficits for a long time, the relevant departments should analyze the cases, find out the reason, fix the responsibilities in light of different circumstances, and give these enterprises a definite time to make up their deficits.

Efforts should be made to expand foreign trade and increase exports. We must further improve product quality and increase the variety and quantity of export goods. We must establish a production base for various export commodities centered on the Taixi coal mine and implement the policy of increasing exports and earn more foreign exchange so that this year's foreign exchange earned through exports will increase by a big margin.

II. Mountain Areas and Plans Should Help Each Other, Learn From Each Other's Strong Points to Offset Their Weaknesses, and Take the Road to Common Prosperity

It is the common desire of the people of all nationalities in Ningxia's mountain areas and plains to vigorously develop the region's national economy and realize the objective of "bringing about an upswing in Ningxia's economy" at an early date. Owing to historical and natural conditions, Ningxia's economic foundation has been weak, its efficiency poor, and its development uneven. In order to accelerate the development of Ningxia's national economy, the mountain areas and plains should help each other, learn from each other's strong points to offset their weaknesses, and take the road to common prosperity.

"Learning from each other's strong points to offset their weaknesses" means that both mountain areas and plains have their respective advantages and disadvantages. Proceeding from the actual situation, they should overcome the unfavorable conditions, develop their strong points, and break a new path for economic revitalization. "Mountain areas and plains should help each other" means that Ningxia's economy should be taken as a whole. As the mountain areas and plains are interdependent, they should unite and help each other forward. "Common prosperity" means that in the process leading to prosperity, some plains or mountain areas may become well-off before others. Those getting well-off earlier than others should support and help the poverty-stricken areas extricate themselves from poverty and gradually take the road to common prosperity.

The CPC Central Committee and the State Council have paid great attention to the people in Xihaigu area. The party organizations, people's congresses, and CPPCC at all levels in Ningxia have also attached great importance to the development of the mountain economy and improvement of the people's living standards. Over the past few years, we have adopted a series of policies and measures and have given support in finance, materials, manpower, and intellectual resources to help develop the economic and social undertakings in the mountain areas.

First, we have enacted correct principles for the construction of the mountain areas. Following the 3d Plenary Session of the 11th CPC Central Committee, the regional authorities put forward the following principle for construction in mountain areas: "Vigorously grow grass and plant trees, promote agriculture with animal husbandry, and develop agriculture, forestry, animal husbandry, and sideline occupation in an all-round way in line with local conditions." The principle for 1983 was "the plains and mountain areas should help each other" and for 1985, grow grass and plant trees and vigorously develop animal husbandry, animal by-products, and processing industry.

Second, we have implemented the policies and measures of giving preferential treatment, relaxing restrictions, and supporting the poor. For example, in 1980, the regional authorities enacted the policy of tax and purchase exemptions for 5 years; in 1984, there was a 13-point policy to help the poverty-stricken mountain areas extricate themselves from backwardness as quickly as possible; and the mountain areas in the south will be exempted from farm taxes for 5 years commencing 1985 and their animal husbandry taxes will also be reduced.

Third, financial support. Apart from the investment in capital construction and the operating expenses for agriculture, forestry, and animal husbandry, the state allocated special funds from 1979 to 1985 totaling over 470 million yuan to support the construction of mountain areas.

Fourth, a total of over 200 million yuan has been invested in the construction of the Tongxin pumping station project in Guhai which can irrigate an area of 500,000 mu and solve the problems of water for drinking and production purposes of 200,000 people.

Fifth, the building of joint-farms and outflow of labor. This is an important measure for supporting the poor. Since 1983, we have move and resettled more than 80,000 people and have set up 13 joint farms. This year we will continue to move another 30,000 people. The number of people moved during the Seventh 5-Year Plan period will total 220,000. A large population and surplus labor are the advantages of the mountain areas. By organizing educated youths of the mountain areas to work in factories, mines, transport units, building industry, service trades, and overseas projects, they can master technical knowledge as well as increase income.

Sixth, we have made investment in intellectual resources. We have enrolled students who are to return to their former units after graduation, lowered the marks required for enrollment, increased the number of students enrolled from mountain areas, set up primary and secondary boarding schools for the Hui people, run different kinds of training classes, and adopted various forms to train qualified people urgently needed by the mountain areas.

Seventh, we have supported the poverty-stricken areas with scientific and technological means. For example, the Xibei Water and Soil Conservation Institute, the Lanzhou Desert Institute, Xibei Agricultural College, Beijing Forestry Institute, Ningxia Agricultural College, and Ningxia Institute of Agricultural Science have established a number of scientific research units in the mountain areas to explore and popularize the methods and experience of maintaining ecological balance in mountain areas and developing the mountain economy.

Eighth, we have strengthened leadership over work in mountain areas and called on all trades and professions to support the mountain areas. The autonomous region has set up a leading organ specially for the construction of mountain areas and sent a number of young and middle aged cadres to work in the mountain counties. This year the regional authorities have again transferred 200 cadres to stay at the grassroots units to help the mountain areas extricate themselves from poverty and take the road to prosperity.

With the vigorous support of various quarters and the arduous efforts of the mountain people, gratifying changes have taken place in the mountain areas. In 1985, the total industrial and agricultural output value of the 8 mountain counties reached over 460 million yuan. Most of the localities attained the goal of "curbing destruction within 3 years" ahead of schedule and 80 percent of the peasants basically solved their food and clothing problems. Of the total, around 10 percent of the peasants became well-off. Furthermore, a number of typical examples of turning poverty into prosperity emerged which accumulated experience, illuminated the path, and enhanced the confidence in putting an end to backwardness in the mountain areas. Naturally, we should also be aware that the current conditions for production in mountain areas are still poor, some localities still have a serious shortage of drinking water, the average per capita income is yet too low, and around 20 percent of the peasants do not have enough to eat and wear. On the one hand, we should popularize the typical examples of turning poverty into prosperity in the mountain areas, and on the other hand, we should try by every means to solve the existing problems and sum up new experience.

We must adopt a realistic attitude and apply the stand, viewpoint, and method of dialectical materialism and historical materialism to analyze, understand, and solve the problems regarding mountain construction and the uneven economic development between mountain areas and plains.

First, the backwardness of the mountain areas is a consequence of various factors including historical and natural conditions. In order to put an end to such backwardness, the problem should be tackled in a fairly long period. As the mountain areas have difficulties greater than the plains, the former should put in a lot of painstaking work to follow the road to prosperity. Therefore, we should proceed from practice while taking the construction of the mountain areas into account. We should be aware of its arduousness and protracted nature and should adopt vigorous measures and work hard to speed up the development of the mountain areas and put an end to the backwardness as quickly as possible.

Second, it is necessary to correctly handle the relationship bewteen the construction of mountain areas and that of the plains. The mountain areas and plains are two different kinds of economic areas in which each has its own characteristics. Instead of following the same pattern in economic development, we should combine the development of the plains with the exploitation of the mountain areas, promote our work gradually from the plains to the mountain areas, and enable the mountain areas and plains to help each other forward. While developing Ningxia's economy, we should give priority to some specific areas. However, we should not mechanically carry out the construction of the areas one by one. Viewed from Ningxia's Seventh 5-Year Plan, most of the small projects are in the mountain areas, while the major projects are in the plains. This is determined by various factors including the law of nature and the commodity economy.

In accordance with the law of nature and the economy, we should guide action in light of circumstances, accelerate the development of the plains, exploit the mountain areas, make the most of the advantages of the plains and mountain areas, and promote Ningxia's economic prosperity.

Third, the central and regional authorities allocate a considerable amount of construction funds to the mountain areas every year. These funds should be properly managed and invested in construction projects and should bring about better economic returns. In the construction of the mountain areas, it is necessary to uphold the principle that integrates state aid with self reliance. First of all, we should invigorate the economy of mountain areas so that they can mainly rely on their own strength to accelerate their economic development. Secondly, we should mobilize and concentrate the forces of all fields to support the mountain areas.

Fourth, it is necessary to further strengthen leadership and adopt various effective measures to vigorously support the construction of the mountain areas. We should mobilize the forces of all fields to better serve the construction of the mountain areas. We should do a good job of the production, purchasing, and processing of farm and sideline products, unclog the circulation channels, strengthen information services, and particularly exploit intellectual resources and support the poverty-stricken areas by applying scientific and technological means. In accordance with the tradition and characteristics of each locality, we should run well town and township enterprises that need less investment and can bring about quick economic returns. The stress should be put on processing industry and service trades. The mountains areas and plains should develop lateral economic ties and learn from each other's strong points to offset their weaknesses. So long as we unite as one, work hard in a down-to-earth manner, make the most of mountain advantages, adopt flexible policies and measures, and maintain a practical style of work, we will certainly be able to put an end to the backwardness of the mountain areas and gradually lead the mountain areas in the south to prosperity.

III. Be Resolute, Make Great Efforts, and Earnestly Carry Out the Building of Socialist Spiritual Civilization

In order to strengthen the building of socialist spiritual civilization, it is necessary to effect a turn for the better in party style and general social mood. The central authorities are determined to correct the party style. We should follow the requirements of the central authorities and make strenuous efforts for 2 years to effect a fundamental turn for the better in party style. Following the meeting of 8,000 officials of the central organs, Ningxia has done a great deal of work and made new progress in correcting party style. We have basically curbed the unhealthy tendencies in 6 respects as pointed out in the circular issued by the General Offices of the CPC Central Committee and the State Council. While investigating and handling the major and important cases, we should overcome our weaknesses, stick to principles, and dare to tackle tough problems. We must do a good job of correcting party style among leading organs, leading cadres, and certain trades and develop the work of correcting party style in depth.

While correcting party style, we must never slacken our efforts to correct social general mood. One of the manifestations of the current unhealthy general social mood is "putting money above everything else." Some people become jealous and forget all moral principles at the sight of money. For the sake of petty profits, they are even willing to lower their dignity and sell their soul. This runs counter to the virtue of the Chinese nation and is incompatible with the communist ideology. A man should have some spirit. Even our forefathers had advocated "planning and worrying ahead of the people and enjoying the fruits after them," being impervious to the temptation of wealth and high positions, and dying for principles. In our socialist society today, we should have lofty ideals, carry forward the tradition and style of honesty, hard work, and plain living, wholeheartedly serve the people, and never become slaves of stinking money.

While we are putting the stress of work on correcting party style and general social mood, we should avoid the misunderstanding that party style and general social mood problems exist everywhere. It is the self-perfection of our party and socialist country to correct party style and general social mood. We should be aware that the main trend of the current party style and general social mood is healthy, that the majority of party members, cadres, masses, and children of cadres are good, and that positive factors occupy a dominant position. Only by looking at the situation in such a manner will it conform to a realistic, dialectical viewpoint and only by adhering to this point can we enhance our confidence in effecting a fundamental turn for the better in party style and general social mood.

It is necessary to vigorously strengthen ideological and political work according to the needs of the new situation. We should make efforts to conduct ideological and political work among the broad rank of cadres and strengthen people's ideological awareness. In recent years, large numbers of advanced units and exemplary figures have emerged on various fronts in Ningxia. We should publicize their advanced thinking and exemplary deeds so as to educate and encourage the people.

A high degree of socialist democracy and a perfect socialist legal system are the guarantee for carrying out the building of the four modernizations and the reform of the economic structure as well as for China's long-term stability. Leading cadres at all levels should clearly understand Comrade Deng Xiaoping's strategic guiding thinking on "grasping construction on the one hand and the legal system on the other" while carrying out the four modernizations, resolutely eliminate the tendencies that ignore the building of the legal system, and heighten the awareness of safeguarding the socialist legal system. It is necessary to make a careful study for the new problems arising in the new period and further establish and perfect the various laws and regulations. We must popularize knowledge on law throughout society so that everyone will known, understand, and abide by the laws. Party cadres and members should take the lead in studying and abiding by the Constitution and laws. They should never try to substitute their views or power for law or overstep their authority to interfere in the judicial activities of the political and legal organs.

Following the struggle to sternly attack criminal offenses and measures taken to maintain social order, the number of criminal cases in Ningxia has gradually declined and social order has improved remarkably. However, economic crimes and robbery cases have increased recently due to the loopholes in public security work within certain enterprises, factories, and instructions. All units should take precautions and establish and perfect the contracted responsibility system in public security work so as to maintain overall social order. We must continue to sternly punish the serious criminal offenders according to law and investigate and deal with the various economic criminal activities. Whoever is involved should be investigated and dealt with according to the seriousness of the case. We must puncture the arrogance of economic crime so as to ensure the smooth progress of reform and construction.

Vigorously developing education, raising the nation's level of science and culture, and training qualified people for socialist [words indistinct] are the important elements in building spiritual civilization. We cannot speak civilization without culture and construction without qualified people. Comrade Deng Xiaoping said: "The key to the success or failure of reform lies in discovering the promoting qualified people." We cannot train qualified people without education. Therefore, we must increase investment in intellectual resources, develop different kinds of educational undertakings at various levels, use modern scientific and cultural knowledge to arm the people and enrich and raise their cultural accomplishment and realm of thought, and speed up the training of a generation of new socialist people with lofty ideals, morality, education, and a sense of discipline. We should cherish qualified people and adopt appropriate measures to train, select, and use them so that our era will become one in which people of talent will constantly come forth in large numbers.

IV. Carry Forward the Spirti of the Foolish Old Man and Make Contributions to the Fulfillment of the Seventh 5-Year Plan

The Seventh 5-Year Plan peiod is a crucial, golden period. It is a "crucial period" because the work during this period is related to whether China's economic development strategy and economic system will further change from the old pattern to a new one and basically lay the foundation for a new socialist economic system with Chinese characteristics; whether we can store up strength for the economic upswing during the 1990's and the continuous social development thereafter; and whether the quadrupling of the total industrial and agricultural output value and the strategic objective of "bringing about an upswing in Ningxia's economy" will be realized by the end of the century with assurance. It is a "golden period" because the current political and economic situation is excellent; the principles and policies of the party and state are well-coordinated and becoming perfect with each passing day; the people are living and working in peace and contentment and are fully confident in the future of the state; Ningxia's political and economic situation was excellent during the Sixth 5-Year Plan period; the fulfillment of the Sixth 5-Year Plan laid solid material strength for the economic development during the Seventh 5-Year Plan period; and the peaceful international environment is extremely favorable to us. We must seize this opportune moment, mobilize the people of all nationalities throughout the region, carry forward the spirit of the foolish old man, and make contributions to the fulfillment of the Seventh 5-Year Plan.

The spirit of the foolish old man means working indomitably and steadfastly, advancing despite difficulties, and fighting unremittingly until we reach our goal. It is the valuable spiritual wealth of the Chinese nation and the fine tradition of our revolutionary ranks. During the war years, thousands upon thousands of revolutionary martyrs advanced bravely and overthrew the Three Big Mountains with the spirit of the foolish old man and under the leadership of our party. Today, in order to realize the grand objective enumerated in the Seventh 5-Year Plan and build China into a powerful, modern socialist country, we should carry forward the spirit of the foolish old man in a wider range. We should carry forward the spirit of the foolish old man in our minds as well as actions rather than pay lip service or engage in idle theorizing.

To carry forward the spirit of the foolish old man means relying on our own strength and working hard and energetically for the prosperity of the country. While fulfilling the tasks of the Seventh 5-Year Plan, all localities and units may encounter difficulties of every description. We must press forward in the face of difficulties, take the subjective initiative and creativity, rely on our own strength, and try by every means to overcome the difficulties. While on duty, each person should do his utmost to fulfill his obligation, be the first to bear hardships and the last to enjoy comforts, give no thought to personal gains or losses, and contribute his all to our great cause. You comrades here should take the lead in fulfilling the tasks of the Seventh 5-Year Plan. You are the backbone forces of various departments on all fronts. The party and people have placed great hopes on you. You should realize the heavy responsibilities you have undertaken. With a sense of responsibility to the party and people, you should promptly express the demands and will of the people, give full play to the role of democratic supervision, and use your exemplary deeds to influence the people and encourage them to devote themselves to reform and contribute to the four modernizations. The party members among the people's congress delegates and CPPCC members have twofold responsibilities. They should set strict demands on themselves, take the lead in publicizing the party's line, principles, and policies, conscientiously observe state laws and decrees, and play an exemplary role in every aspect.

To carry forward the spirit of the foolish old man means to adopt a realistic attitude and solid work style, do more work rather than indulge in empty talk, and wholeheartedly serve the people. We should adopt a new pose, take on a new look, and play in turn to adapt ourselves to the new tasks in the new period. Leading organs and cadres at all levels should combine their fervent revolutionary enthusiasm and serious scientific attitude with a responsible, realistic spirit, proceed in everyting from practice, and act according to the objective law. They should get rid of bureaucratism, forsake the "yamen" work style, cater to the needs of the grassroots units, serve the masses, make thorough investigations and studies, and solve practical problems. They should have a boundless sense of responsibility in their work, never dispute over trifles or shift responsibility onto others, increase efficiency, and improve the quality of their work. They should seriously study Marxism-Leninism-Mao Zedong Thought, acquire scientific knowledge, constantly improve their ideological, educational, and professional quality, enhance the foresight, systematicness, and scientific nature of their work, forsake a dependent mentality and sticking to old ways and conventions, work with initiative, and create a new situation in all fields of endeavor. The people's congress is the organ of state power which performs the function of supervision over the state administrative organs. It plays an extremely important role in realizing socialist democracy and ensuring that the people are masters of the country. The CPPCC is a patriotic united front organization and a place with a galaxy of talent. It performs the function of political consultation and democratic supervision over the major principles and policies of the state. The people's congress and CPPCC at all levels throughout Ningxia have effectively performed their functions and made outstanding contributions in many fields. In accordance with the needs of the new situation, we should do our work vigorously and play a greater role in developing socialist democracy, exercising supervision, and promoting the building of spiritual and material civilizations.

In order to carry forward the spirit of the foolish old man, we should think and work with one heart and one mind, unite and cooperate with each other, pool the wisdom and efforts of the masses, and accomplish the tasks with an indomitable spirit. To fulfill the Seventh 5-Year Plan and realize the objective of bringing about an upswing in Ningxia's economy are the general interests of the whole region and the common aspiration of the people of all nationalities in Ningxia. Each locality, department, unit, and comrade should take the overall situation in to account, put partial and local interests under those of the whole, take concerted action, help and support each other, learn from each other's strong points to offset their weakensses, and advance side by side. It is necessary to resolutely resist and combat liberalism politically, individualism ideologically, and departmentalism in work. We must strengthen unity of various quarters, resolutely fight against the ideas and deeds that disrupt unity and affect the overall situation, consolidate and develop the political situation characterized by stability and unity, and create a fine social environment for the fulfillment of the Seventh 5-Year Plan.

Comrades, we have drafted the grand plan and sounded the bugle. With arduous efforts made in the next 5 years, I believe that a greater change will take place in Ningxia's economic and social outlook. Let us unite as one, make concerted efforts, carry forward the spirit of the foolish old man, and work indomitably and in a down-to-earth manner to triumphantly fulfill the Seventh 5-Year Plan.

NINGXIA FIFTH PEOPLE'S CONGRESS SESSION CONCLUDES

HK140734 Yinchuan NINGXIA RIBAO in Chinese 30 Apr 86 p 1

[Report: "Fourth Session of Fifth Regional People's Congress Concludes"]

[Text] The 8-day fourth session of the 5th regional people's congress successfully concluded yesterday afternoon at the Ningxia Workers' Cultural Palace after fulfilling the prepared agenda.

The session urged the region's people of various nationalities to be dedicated heart and soul to the same course and be united under the leadership of the regional CPC committee and the regional people's government. They should carry forward the spirit of the Foolish Old Man who removed the mountains and actively take part in the great undertaking of the Seventh 5-Year Plan, so as to accomplish successfully the region's "Seventh 5-Year Plan" as well as to achieve the aim of "invigorating Ningxia" and other goals by the turn of this century.

The chairmen of yesterday's meeting were Li Xuezhi, Ma Qingnian, Hao Tingzao, Shen Xiaozeng, Liu Guofan, Xue Hongfu, Li Yunhe, Ma Youde, Ding Yimin, Li Shumin, Guo Wenju, Liang Feibiao, Feng Mao and Liu Xueji.

The closing ceremony was presided over by Ma Qingnian, executive chairman of the session.

The session adopted the resolution on the region's Seventh 5-Year Plan and the report on the Seventh 5-Year Plan; adopted the resolution on the region's 1986 national economic and social development plans; adopted the resolution on the region's 1985 final accounts and 1986 budget; adopted the resolution on the work report of the 5th regional people's congress standing committee; adopted the resolution on the work report of the regional people's higher court; and adopted the resolution on the work report of the regional people's procuratorate.

Moreover, yesterday's meeting acted on the proposal of the session's chairman and held a by-election in which Li Yunqiao [2621 0061 0829], Tian Ruixiang [3944 3843 4382], Ha Guilian [0761 6311 1670], and Ma Qixing [7456 0796 2450] were appointed as standing committee members of the 5th regional people's congress.

Then, Li Xuezhi, secretary of the regional CPC committee, delivered a speech at the meeting. (Excerpts of the speech is published in another article.)

At about 1600, the session completed the agenda. Ma Qingnian announced the successful conclusion of the 4th session of the 5th regional people's congress.

Also seated on the rostrum at yesterday's meeting were responsible people of the regional CPC committee, the advisory committee of the regional CPC committee, the discipline inspection of the regional CPC committee, the regional people's government, Ningxia Military District, the regional people's higher court, the regional people's procuratorate, the regional CPPCC and democratic parties; non-party democratic people; and retired old cadres: Hei Boli, Ma Sizhong, Cai Zhulin, Bai Zhenhua, Ma Yingliang, Jiang Guangdong, When Li, Ma Tengai, Yang Huiyun, Xia Siping, Wang Huan-min, Liu Desheng [0491 1795 0524], Zhang Shiru [1728 0099 0320], Ma Zhao, Lei Qilin, Chen Jingbo, Ma Likai, Zhang Yuan, Ma Liesun, Yang Yuchun, Yang Xin, Ma Dezong, Zhang Junxian, Lu Ming [7773 7686], Peng Linbai, Yang Zhengxi [2799 2973 9823], and so on.

All members of the fourth regional CPPCC who attended the fourth session attended yesterday's meeting.

The closing ceremony was also attended by responsible people of the regional departments concerned. PLA units attached to the Ningxian Military District and the regional armed police force.

SHANDONG PEOPLE'S CONGRESS SESSION OPENS

SK110303 Jinan Shandong Provincial Service in Mandarin 2200 GMT 10 May 86

[Excerpts] The Fourth Session of the Sixth Shandong Provincial People's Congress opened ceremoniously at Jinan's Shenzhuquan Auditorium at 0830 on 10 May. Li Zhen, executive member of the presidium of the session, presided over the opening ceremony.

[Begin Li recording] The Fourth Session of the Sixth Sandong Provincial People's Congress is now open. The actual number of deputies of this people's congress is 1,035. A total of 136 have asked for leave, including sick leave, attending today's session are 899 deputies, which is a quorum. Liao Hansheng, vice chairman of the NPC Standing Committee, who is now conducting an inspection tour in our province, is also attending today's session. We extend our warm welcome to him. [applause] We also extend warm welcome to Comrades (?Wang Fu), and [name indistinct], deputies to the Sixth NPC elected by our province, and standing committee members of the NPC, who are invited to today's session. [applause] Now we will call upon Governor Li Changan to give a report on the Draft Seventh 5-Year Plan for Shandong Provincial Economic and Social Development. [applause] [End recording]

Governor Li Changan's report is composed of four parts: 1) a solid foundation for the economic and social development of the Seventh 5-Year Plan period laid by the successful fulfillment of the Sixth 5-Year Plan; 2) the guiding ideology, fighting goals, and major tasks for the economic and social development of the Seventh 5-Year Plan period; 3) the key to guarantee the smooth implementation of the Seventh 5-Year Plan; and 4) the building of government organs during the Seventh 5-Year Plan period.

Pther executive members of the presidium present at the opening ceremony included Liang Buting, Jiang Chunyun, Li Zhen, Xiao Han, Xu Leijian, Gao Fengwu, Zhang Zhusheng, Xu Jianchun, and Lin Ping. Attending as nonvoting delegates were members to the fourth session of the fifth provincial CPPCC committee; responsible persons of the various work departments subordinate to the provincial people's government; responsible persons of the various departments, committees, and offices of the provincial CPC committee; deputy secretary general of the provincial people's congress standing committee; deputy director of the general office of the provincial people's congress standing committee; vice president of the provincial higher people's court; and deputy chief procurator of the provincial people's procuratorate.

On the afternoon of 10 May, the fourth session of the sixth provincial people's congress held its second plenary meeting at the Zhenzhuquan Auditorium. Xiao Han, executive member of the presidium, presided over the meeting. Wang Xin, chairman of the provincial planning committee, delivered a report on the draft plan for the Shandong provincial national economic and social development for 1986. Guo Changcai, director of the provincial finance department, delivered a report on the Shandong provincial 1985 final accounts, and the draft 1986 budget.

Beginning 11 May, the session will hold group discussions for 4 days on the reports given by Governor Li Changan, Chairman Wang Xin, and Director Guo Changcai.

SHANXI GOVERNOR ASSESSES SIXTH 5-YEAR PLAN ACHIEVEMENTS

Reports on Seventh 5-Year Plan

HK090121 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 8 May 86

[Excerpts] Governor Wang Senhao said in his report on ths draft Seventh 5-Year Plan that great success was achieved in reform of the rural economic structure in Shanxi during the Sixth 5-Year Plan.

He said: Total rural social output value in 1985 reached 14,378,000,000 yuan, an increase of (110) percent over 1980, having risen at an annual average of 16.9 percent. Average annual grain production during the Sixth 5-Year Plan was 8,101,000 tons, compared with 7,227,000 tons during the Fifth 5-Year Plan, a rise of 12.1 percent. Average annual output of cotton and oilbearing crops also showed relatively great increases. The province's wheat output in 1985 was 2.95 million tons, a rise of 150 percent over 1980. The amount of wheat available per persons reached 112.5 kilograms.

While crop cultivation developed, forestry, animal husbandry, and rural industry and sideline occupations also developed very quickly. The forest cover rose from 10.2 percent to 13.8 percent. Total income of the township enterprises in 1985 was 85. billion yuan, double the figure for 1980. The number of people working in these enterprises was 2.15 million, accounting for 28 percent of the rural labor force.

He pointed out: The province achieved relatively rapid development in education and science an education during the Sixth 5-Year Plan. During the 5 years the province spent 3.61 billion yuan on education, science and technology, culture, public health, sports, and so on. This represented 28.2 percent of total spending during the period, and showed an increase of 117.5 percent compared with the Fifth 5-Year Plan. Spending on education amounted to 2.06 billion yuan, 116.8 percent more than during the Fifth 5-Year Plan. Investment in capital construction for education was 601 million yuan, 350 percent more than during the Fifth 5-Year Plan. The percentage of school-age children attending school and the consolidated percentage respectively reached 98.5 and 98.6. Thirty-seven counties and cities now have universal primary education.

Notes Improved Living Standards

HK110159 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 10 May 86

[Summary from poor reception] Governor Wang Senhao said in his report to the provincial people's congress session that there was a marked improvement in urban and rural living standards during the Sixth 5-Year Plan. Net peasant incomes more than doubled, while workers' wages rose at an annual rate of 7.7 percent. Jobs were found for some 600,000 people in the towns. Disposable income of urban families rose from 365.6 yuan in 1980 to over 560 yuan in 1985. Urban and rural savings deposits reached 5.29 billion yuan in 1985.

He said: Urban and rural incomes will grow further during the Seventh 5-Year Plan. Some 1.47 million people in the towns should be placed in jobs. Some 10 million square meters of workers' housing will be built. Urban infrastructural construction will be stepped up, and the environment improved.

Governor Wang Senhao said the province must continue to open up to the world, expand foreign trade, and use more foreign investment during the Seventh 5-Year Plan.

The governor said: "We must resolutely implement the basic national strategy on family planning during the Seventh 5-Year Plan and strictly control population growth. The natural population growth rate should be kept below 10.9 per 1,000 during the period of the plan. The province's population should not exceed 27.63 million by 1990."

On the energy question, Governor Wang Senhao said that the province will ship out to the rest of the country 980 million tons of coal during the Seventh 5-Year Plan. He said: The state attaches great importance to the development and construction of an energy base centered on Shanxi. By 1990, the province's coal output will reach 270 million tons, 27 percent of the national output. Railroad capacity for shipping coal out of the province will exceed 300 million tons a year. Annual power generation will exceed 30 billion kilowatt hours.

Links Better Management, Economic Results

HK120221 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 11 May 86

[Excerpts] Governor Wang Senhao pointed out in his report on the draft of the Seventh 5-Year Plan that correctly handling the relationship between growth rate and economic results and regarding the improvement of economic results as the cardinal link in all economic work constitutes one of the principles and policies that must be implemented very well during the period of the plan.

He said: The province's economic growth rate during the Seventh 5-Year Plan should be a bit lower than the actual fiture for the Sixth 5-Year Plan.

This arrangement will help us to focus on improving economic results and to avoid excessive tension in economic relations. We can thus ensure the smooth progress of reform.

Wang Senhao stressed: The key to improving economic results lies in improving and modernizing enterprise management. In the future, in judging an enterprise's operational performance, we cannot just look at its output and output value but must make an overall examination of its output, output value, product variety, quality, input, production costs, and capital turnaround. In particular, we must regard developing new products, improving product quality, and lowering energy and raw material input as the focal points in improving economic results.

Governor Wang Senhao stressed in his report: During the Seventh 5-Year Plan, we must unswervingly assign to an important strategic position education and science and technology, step up our efforts to exploit brainpower, and promote technological progress.

He said: During the Seventh 5-Year Plan, the growth in spending on education must be higher than the growth in regular financial revenue. Average spending per student should increase gradually. We should also encourage and guide enterprises, collectives, popular organizations, and various social sectors to operate a variety of educational undertakings. We must introduce the 9-year compulsory education by stages and steps during the period of the plan, and also continue to readjust the structure of secondary education. By 1990, the number of students in vocational and technical senior secondary schools should be about equal to the number in ordinary senior secondary schools.

Efforts to develop tertiary education should be focused on tapping the potentials of the old schools. We should lay stress on developing various specialities. We should straighten out and improve adult tertiary education and continue to promote worker training. We should encourage people to become talented through self-study.

Science and technology work should continue to apply the principle of serving the province's economic construction, first serving the technological transformation of key enterprises.

Governor Wang Senhao said: In the past 5 years, while building socialist material civilization, we have paid attention to and stepped up the building of spiritual civilization.

SHANXI PEOPLE'S CONGRESS SESSION CONCLUDES

HK170125 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 16 May 86

[Excerpts] The fourth session of the Sixth Shanxi Provincial People's Congress concluded in the Hubin Hall in Taiyuan on 16 May. The executive chairmen at the closing ceremony were Ruan Bosheng, Huo Fan, Wang Tingdong, Feng Sutao, Ma Guishu, Jiang Yi, Zhang Jianmin, Hui Yuyu, Wang Wenzhang, and Wang Xi. Also present were Wang Senhao, Wang Jiangong, Bai Qingcai, Lu Gongxun, Wang Maolin, Zhang Weiqing, Zhang Bangyi, Yi Honglin, Wang Kewen, Jia Jun, Hu Xiaoqin, Yan Wuhong, Guo Yuhuai, Li Xiuren, Zhu Weihua, Wang Xiujin, Ling Daxi, Yang Mingbao, Shi Xingsan, and others.

The session approved by show of hands resolutions on the province's Seventh 5-Year Plan; on the national economic and social development plan for 1986; on the1985 final accounts and 1986 budget; on regulations on implementing the law on compulsory education; on regulations on the organization of city, county, and district people's congresses; and on accepting the resignation requests of Wang Xi, vice chairman of the provincial people's congress standing committee, and Zhang Weiqing, vice governor. The session elected (Feng Zhimao) as replacement vice governor and (Liu Yao) as a replacement member of the provincial people's congress standing committee.

The session also adopted resolutions approving the report of vice chairman Huo Fan on the work of the provincial people's congress standing committee; the report of court president Zhao Yaoren on the work of the provincial higher people's court; and the report of chief procurator Liu Yanqing on the work of the provincial procuratorate.

The session's resolution on Governor Wang Senhao's report on the draft of the province's Seventh 5-Year Plan pointed out that during the period of the plan the province should focus on energy, communications, education, science, and technology, technological transformation, environmental and ecological protection, and on helping poor areas to transform themselves. Hence, it is essential to handle correctly the relationship between growth rate and economic results. We must maintain an appropriate growth rate under the premise of improving economic results, strictly control investment in fixed assets, concentrate forces to ensure key construction projects, and carry out technological transformation of existin enterprises. We must ensure steady growth in grain production while actively promoting diversified undertakings and township enterprises, and further invigorate the rural economy.

Focusing on building the province's energy, heavy, and chemical industry bases, we must [words indistinct] job in coal processing and conversion, rationally readjust the production structure and product mix, uphold the principle of opening up to the world, increase our ability to increase foreign exchange earnings from exports, and expand external economic and technological cooperation. We must persevere in assigning an important strategic position to education, science, and technology.

SICHUAN PEOPLE'S CONGRESS HOLDS PLENARY SESSION

HK051518 Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 4 May 86

[Excerpts] This morning the fourth session of the sixth provincial people's congress held its third plenary meeting. The participants listened to explanations given by provincial Vice Governor Kang Zhenhuang on the revised draft of provincial regulations on the implementation of compulsory education, a work report by Meng Dongbo, vice chairman of the provincial people's congress standing committee, and a work report by Ren Lingyun, president of the provincial higher people's court; adopted two decisions on accepting Qin Chuanhou's resignation as vice chairman of the provincial people's congress standing committee, (Huang Wenruo's) resignation as member of the provincial people's congress standing committee, and Liu Chunfu's resignation as provincial vice governor; and adopted election methods in the current session.

The meeting was presided over by Ji Chunguang, executive chairman of the session. Some 1,286 delegates attended the meeting.

Meng Dongbo, vice chairman of the provincial people's congress standing committee, gave a report on the work done by the standing committee since the third plenary session of the sixth provincial people's congress.

In his work report to the meeting, Ren Lingyun, president of the provincial higher people's court, said that all people's courts in the province have further straightened out their guiding thought, carried out judicial activities in an all-round way, actively served the party's general target and task, and have done quite a lot of work. They have hit hard at serious criminal activities, further promoted improvement of public order, stability of the society, severely punished serious economic criminals, and ensured smooth progress of the economic structural reform and the four modernizations.

In his work report to the meeting, Gao Zhenzhong, chief procurator of the provincial people's procuratorate, said that over the past year, the procuratorates in the province have given full play to the supervisory role of law, hit hard at serious economic crimes and criminal activities, and made much progress in all procuratorary work, playing a good role in protecting the people, striking enemies, punishing criminal elements, and serving the four modernizations.

Also acting as executive chairman of today's meeting were Liu Xilin, Deng Zili, Wang Yanli, (Lin Yin), (Wang Runfu), (Chen Ji), (Chi Jisha), (Pan Zhijiu), (He Zhikuan), (Luo Kewen), (Yuan Shuji), (Yao Kehua), (Yao Jinying), and (Wu Xiaoguang). Provincial CPC committee Secretary Yang Ruadi, who has just returned to Chengdu from another province, attended today's meeting.

At the third meeting held by the fourth plenary session of the sixth provincial people's congress, provincial Vice Governor Kang Zhenhuang explained the revised draft of provincial regulations on implementation of compulsory education. He stressed that making compulsory education universal is a foundation and indication of modern civilization, as well as a strategic task concerning the upgrading of the quality of the Chinese nation and the prosperity and development of our country.

Vice Governor Kang Zhenhuang further explained the nature of compulsory education--the number of years and the school system for compulsory education, the age of those enjoying compulsory education, upgrading the quality of compulsory education, plans and arrangements for implementing compulsory education, and the management system, funds, and school conditions of compulsory education.

TIANJIN CONGRESS STANDING COMMITTEE ISSUES WORK REPORT

SK151230 Tianjin TIANJIN RIBAO in Chinese 1 May 86 p 3

[Work report by Bai Hua, vice chairman of the Tianjin Municipal People's Congress Standing Committee, at the 5th session of the 10th municipal People's Congress on 26 April 1986]

[Excerpts] Fellow deputies:

Entrusted by the municipal people's congress standing committee, I would like to deliver a report for approval with regard to the work done by the standing committee in the period since the 3d session of the 10th municipal people's congress.

Over the past year, the standing committee has achieved new progress in the work of formulating local regulations and rules, carrying out legal and work supervision, and bringing into play the role of deputies throughout the municipality, in line with the general demand of building socialism reflecting Chinese characteristics, the general guideline of enforcing the open policy to the outside in order to enliven the domestic economy, and the practical need of building socialist material and spiritual civilizations throughout the municipality; and in line with the major tasks of developing socialist democracy, improving socialist legal systems, actively conducting exploration, pioneering the road of advance, and earnestly exercising its function and power imposed by the Constitution and the law.

I

Formulating local regulations and rules constitutes an important duty of the standing committee. Over the past year, the standing committee has persistently put the work of formulating local regulations and rules, particularly mapping out local economic regulations and rules, on the first place in its work schedule.

In order to meet the need of the new situation prevailing in conducting reforms in economic systems and enforcing the open policy to the outside throughout the municipality, in July 1985 the standing committee formulated and issued the "provisions" with regard to the management of the municipal economic and technical development zone, the "regulations and rules" with regard to the enterprise registration management in the municipal economic and technical development zone, the "provisions" with regard to the labor management in the municipal economic and technical development zone, and the "provisions" with regard to the land management in the municipal economic and technical development zone. All of these are the first regulations and rules formulated by the standing committee, which are connected with the economic affairs of foreign countries, and are the first set of regulations and rules for the municipal economic and technical development zone.

The standing committee has paid attention to continuously improving working systems and legal procedure in practice. In order to upgrade the quality of meetings sponsored by the standing committee, in November 1985 the standing committee formulated the "provisions" with regard to the meeting systems of the municipal people's congress standing committee, in which there were stipulations on making preparation and committee meetings' procedures for examining motions, and on implementing resolutions and decisions. The formulation and enforcement of these stipulations contribute to improving the democratic system of the standing committee and ensuring that the staff of the standing committee to fully exercise their duty and power.

In line with the motions offered by the deputies at the 3d session of the 10th municipal people's congress, the standing committee coordinated with the departments concerned to continuously formulate the draft regulations and and rules with regard to the protection of legal rights and interest of these enterprises. They also offered their opinions after carrying out investigation and studies with regard to revising the contents of the local regulations and rules on urban construction and environment protection.

In conducting the work of formulating local regulations and rules, the standing committee has implemented the principle of "adopting an active attitude toward work, meeting practical needs, adopting feasible ways, and making use of the mature conditions," and has paid attention to the following three tasks: 1. Proceeding from the urgent need of building legal systems throughout the municipality and on the premise of eliminating the conflict among the Constitution, the law, and the administrative regulations and rules, the standing committee has made efforts to pioneer new roads, to boldly engage in practice, and to actively formulate the local regulations and rules concerned. 2. The standing committee has made concerted efforts with the departments concerned in order to help each other forward. 3. The standing committee has held matured discussed on these regulations and rules before they have been formulated.

The standing committee has strengthened the work of soliciting opinions on formulating the state draft law. Since 1985, it has placed the work on the agenda of meetings participated by chairman and vice chairmen of the standing committee.

II

Conducting supervision over the work done by the municipal people's government, the municipal people's courts, and the municipal people's procuratorates constitutes an important function and power imposed by the law on the local organs of state power. Over the past year, the standing committee has conducted supervision over the implementation of the law and the regulations and rules and carried out work supervisions by hearing or examining the work reports, organizing members and deputies to conduct inspections and to carry out investigation to cope with specific problems.

The key to enhancing the building of socialist legal systems lies in abiding by the law as long as it exists. Therefore, the standing committee has carried out supervisions in a planned manner over the implementation of the state law and the local regulations and rules in order to cope with the specific problems, and has regarded as a work emphasis the supervision over the implementation of economic law, regulations, and rules.

In addition to the supervision over the implementation of economic law, regulations, and rules, the standing committee has also conducted inspections in line with the necessity over the implementation of other laws, regulations, and rules.

Carrying out supervision over the work done by the municipal people's government, the municipal people's court, and the municipal people's procuratorate is not only the important aspect of the local organs of state power in exercising their function and power, but also provides powerful support to the executive and judicial organs. The standing committee has strengthened the supervision over the work done by various circles in carrying out investigation, inquiry, and examination over the major problems cropping up in the program of building socialist material and spiritual civilizations, which are most concerned by the masses.

In the financial and economic aspects, the standing committee has paid close attention to the new situation and problems cropping up in the drive to conduct reforms throughout the municipality.

In the aspect of political science and law, the standing committee has strengthened the supervision over the work done by the judicial and public security organs in paying attention to the struggle against economic crimes and the trial work of civil cases.

In the aspect of urban construction, the standing committee has strengthened the supervision over the work done in the major projects made under the municipal overall plan of building Tianjin into a new beautiful, clean, and modern city with developed amenities.

In the aspects of education and public health, the standing committee has constantly regarded education, particularly general education, as its central work.

The standing committee has also paid great attention to the work of dealing with the petition letters and visits of deputies and the masses. As of the end of March this year, the standing committee received 1,422 visitors and dealt with 2,195 letters. It also paid attention to selecting some typical cases and charges from the visits and letters to immediately inform the departments concerned for disposition, in which the standing committee realized its supervision over the state apparatus and their working personnel.

In carrying out supervisions over various work mentioned above, the standing committee has also done a good job in grasping the following four tasks: 1. Efforts have been made to select problems for supervision in a planned manner and by focusing on the key problems. It has chiefly dealt with the major problems that are most concerned by the masses, have profound influence, and are possible to be solved. 2. Efforts have been made to fully acknowledge the correct experience gained by the executive and judicial organs, to offer its opinions for solving the exposed problems, and to resolutely correct the mistakes violating the law. 3. Efforts have been made to fully develop democracy and to respect the duty and power of deputies throughout the municipality. In the course of conducting supervisions, the standing committee has organized the deputies to study relevant laws, regulations, and rules; provided for them the reports on relevant situations and the necessary materials; and has solicited opinions from the deputies in order to relay them to the departments concerned for disposition. 4. Efforts have been made to regard the materials gained in investigation and studies as a foundation for carrying out the supervisory work. Prior to hearing work reports and making an inspection tour, the standing committee has delved into reality for carrying out investigation in order to obtain first hand materials, to learn about both good and bad typical cases, and to upgrade the efficiency of the supervisory work.

III

The important work of the standing committee is to establish a close tie with deputies throughout the municipality and to bring their role into full play. The standing committee has regarded the work as an important task for developing socialist democracy and improving the system of the people's congress and has enhanced the research and exploration of the work. Over the past year, it has emphatically carried out the following three tasks:

1. The standing committee has manufactured and issued the certificates of deputies for their working activities in supervisions and inspections. In order to make it convenient for deputies to perform their duty and power imposed by the Constitution and the law, to help the municipal people's government push its work forward, and to better relay the people's opinions and demands to the state apparatus, it manufactured and issued the certificates of deputies on 15 October 1985 after the longer deliberations and consultations.

2. The standing committee has held forums participated in by the deputies. Since 1983 it has held a larger-scale forum annually with the direct

participation of the municipality's mayor who can hear the opinions and hold discussions with the deputies on the grand plan for building the four modernizations.

3. The standing committee has earnestly dealt with the motions, proposals, criticism, and opinions offered by the deputies.

Over the past year, the standing committee has continuously enhanced its ties with the district and county people's congress standing committees. Each meeting of the standing committee has invited as observers the responsible persons of the district and county people's congress standing committees and has paid attention to listening to their opinions and demands. Some responsible persons in the standing committee have gone to some district and country people's congress standing committees to exchange work experiences and to solicit their experience gained in work. In February this year the standing committee invited the comrades of the district and county people's congress standing committees to exchange the experience gained by the financial and economic commissions (offices) under these standing committees. All of the activities have played a favorable role in exploring the law of the work done by the local organs of state power and in upgrading their work quality.

Since the 3d session of the 10th municipal people's congress, the standing committee has earnestly exercised its duty and power in approving the personnel changes of the state apparatus. In line with the law, it has approved the appointments and dismissals of 116 personnel. Of these staffers, 4 are of the municipal people's congress standing committee; 42, of the municipal people's government; 51, of the municipal people's courts; and 19, of the municipal people's procuratorates.

The standing committee has carried out friendly activities with the assemblies and parliaments of foreign cities. In November 1985 it received the goodwill visiting group of the Osaka City Representative Assembly, Japan, which was headed by Tanaka Kisaburo, speaker of the city assembly.

Over the past year, the standing committee has done a great deal of work and scored certain achievements. Meanwhile, there have been a large number of shortcomings which chiefly are to have been short of long-term plans in formulating local regulations and rules, to have not fully exercised its function and power in conducting supervisions, to have not established extensive and profound ties with deputies, and to have not thoroughly improved its systems. All of these urge us to earnestly conduct reforms in the future work.

Fellow deputies: The Constitution and the Organic Law for Local Congresses and Governments have imposed quite heavy duty and power on local people's congresses and their standing committess. The demand and hope harbored by the people on the people's congresses have become higher and higher. Under the new circumstance, let us deeply implement the spirit of the Fourth

Session of the Sixth NPC, further develop the spirit of the Foolish Old Man removing the mountain by following the principle of grasping transformation and construction on the one hand and improving socialist legal systems on the other hand, made efforts to pioneer the road of advance, and strive to fulfill successfully the task in the first year of the implementation period of the "Seventh 5-Year Plan."

ZHEJIANG PEOPLE'S CONGRESS SESSION OPENS

OW060529 Hangzhou Zhejiang Provincial Service in Mandarin 0300 GMT 5 May 86

[Text] The Fourth Session of the Sixth Zhejiang Provincial People's Congress opened ceremoniously this morning at the Great Hall of the People in Hangzhou.

At 0830, Li Fengping, executive chairman of the session, declared the session open. Sitting on the rostrum were executive chairmen including Chen Anyu, Shang Jingcai, Li Yuhua, Wu Zhichuan, and Wang Qidong. Leading comrades, including Wang Fang, Xue Ju, Chen Fawen, Wu Minda, Shen Zulun, Li Dexin, Liu Xinzeng, Tie Ying, Wang Jiayang, and Li Qing attended the opening ceremony and were seated on the rostrum.

Amid warm applause, Governor Xue Ju delivered a report on the Seventh 5-Year Plan for Zhejiang Province. His report is divided into four parts: 1) The implementation of the Sixth 5-Year Plan; 2) the basic tasks and the major work in economic construction in the period of the Seventh 5-Year Plan; 3) Continue the thoroughgoing and systematic reform of the economic structure; and 4) Further strengthen socialist spiritual civilization.

Warm applause broke out in the hall when Governor Xue Ju finished reading his report.

A total of 821 deputies attended today's session. Members of the fourth session of the fifth provincial CPPCC committee were present as nonvoting delegates. Also present as nonvoting delegates were the province's deputies to the NPC, and officials of the provincial departments and the people's congresses and governments of cities, prefectures, counties, and districts under the jurisdiction of cities.

BRIEFS

HENAN PEOPLE'S CONGRESS--The fourth session of the sixth Henan provincial people's congress concluded in Zhengzhou on 9 May. Present at the closing ceremony were leading comrades of the party, government, and army in the province Yang Xizong, Liu Zhengwei, He Zhukang, Song Yuxi, Lin Yinghai, Zhan Jingwu, Zhang Zhigang, Qin Kecai, Song Zhaoshu, and Zhang Chixia; Li Ming, president of the provincial higher people's court; and Zhao Wenlong, president of the provincial people's procuratorate. Zhang Shude, chairman of the provincial people's congress standing committee, presided. In a speech, Zhang Shude pointed out: This session has given full play to democracy and achieved its predicted tasks. This has been a lively and encouraging meeting. He expressed the hope that the deputies would seriously study and actively publicize the province's Seventh 5-Year Plan and achieve all the tasks and goals set in the plan. This is the common historic task of the people of the whole province. [Excerpts] [Zhengzhou Henan Provincial Service in Mandarin 2200 GMT 9 May 86 HK] /6662

ZHEJIANG PEOPLE'S CONGRESS MEETING--The presidium of the Fourth Session of the Sixth Zhejiang Provincial People's Congress held its second meeting this morning to hear briefings by various delegations on their deliberations on Governor Xue Ju's report on Zhejiang Province's Seventh 5-Year Plan. Governor Xue Ju, Vice Governors Wu Minda and Li Debao, and responsible persons of departments concerned attended the meeting. ECONOMIC MANAGEMENT

JOURNAL URGES CORRECT ATTITUDE ON FINANCIAL MANAGEMENT

HK241210 Beijing JINGJI GUANLI in Chinese No 2, 5 Feb 86 pp 13-16

[Article by Han Manshou [7281 3341 1108]: "Do Away With Traditional Concepts, Take a Correct Attitude Toward Financial Management"]

[Text] It is an inevitable demand owing to historical developments that we should continue to satisfactorily carry out the reform of our financial system; gradually put an end to old traditional habits and practices; learn new ways of financial management including those related to making funds grow, accumulating funds, and spending funds; turn the supply-type finance that is characterized by collecting all income and funding all expenditures into the constructive administration-management-type finance; and serve the vigorously developing new situation and the entire economic structural reform. In order to do so, it is very important to do away with traditional concepts and foster new financial management thoughts.

I. Doing Away With Old Concepts Is a Necessary Precondition for Achieving a Change in Our Financial Work

Concepts are the reflection of objective reality in people's minds and they influence and dominate people's acts. We have long had some fixed concepts about a series of questions including those on what socialism is and how we are to carry out socialism. These concepts fetter people's minds and hinder the development of our productive forces. In our financial work, these concepts are shown in the following: 1) We often only consider the finance aspect alone, namely, the tasks of collecting revenue and allocating expenditure in doing our financial work, and we seldom strive to understand the whole situation, manage our sector in light of the whole situation, discuss major issues, or consider financial matters in light of our economic development. 2) We often haggle on the amount of funds to be allocated for a certain matter and focus on solving the problem of funding our administrative expenditure, but we seldom pay attention to researching our financial policies and theories in order to promote our production, enliven our economy and find sources of revenue. 3) We often focus on our immediate interests and make rigid calculations about the short-term factors that affect our financial revenue and expenditure, but we seldom proceed from our long-term interests to make flexible calculations with broad vision. 4) For 30 years, we have followed the old patterns and practices without any deviation and lacked the courage to carry out reform and explore new paths. Of course, we can list some more, but the above are the major ones. What they have in common is a "fear"; that is, we fear the emergence of troubles, failure to fulfill our tasks, and punishment should we deviate from the "key links" and "line." In short, these fears hinder the progress of our reform and are detrimental to the transformation of our financial work.

There is an ancient saying that "in doing anything, we should have new ways and refrain from repeating poor old practices." What are the new ways? As far as the present needs are concerned, in order to transform our financial work, we should have new ways to change from a "supply-type" into a "construction-type," from a "control-type" into a "management-type," from a "closed type" into an "open type," and from a "stability-oriented type" into a "development-type." Toward this end, we should continue to eliminate the influence of "leftism," better emancipate our minds, do away with the outdated conventions, and establish new ideas on our financial management. This is the demand of the development of our situation and of our four modernizations. A review of our history and summation of our experience show that we should start with the following in establishing our new ideas on financial management:

1. Our new ideas on financial management should deal with both budgetary and extrabudgetary funds. In other words, we should establish a comprehensive financial system. Since the 3d Plenary Session of the 11th CPC Central Committee, as our national economy has developed and as we have been carrying out an economic structural reform, extrabudgetary funds have drastically increased. For example, in Shanxi, the ratio of extrabudgetary funds to the state budget revenue was 0.995 to 1 for 1982 and 1.053 to 1 for 1983. In 1984, extrabudgetary funds reached 3 billion yuan, 12.4 percent bigger than the budget revenue. The 3d Plenary Session of the 11th CPC Central Committee has opened the way for our people to become rich. In 1984, the per capita income of the peasants in Shanxi Province exceeded 350 yuan and the per capita cash in hand was 50-100 yuan. This is a considerable amount of social funds that urgently require guidance and management. Therefore, our financial work, which now only deals with budgetary funds that account for one-third of our national income, has already fallen far behind of the demand of the development of the situation. Only by establishing a comprehensive financial plan through financial means can we amass all the funds that can be raised and employ them in various aspects of our four modernizations. Only by so doing can we have both sources and outlets for funds and have better economic results with our limited funds. One issue that we should attach importance to is to do away with the old custom that the financial department can only make investment without compensation. With the aid of our legal, administrative, and economic means, we should correctly apply the powerful economic lever of finance to control and regulate the overly high growth rate of our national economy, manage to strike a financial, credit, material, and foreign payments balance, and try every means to support the projects that need small investment but achieve quick results.

2. In carrying out the reform of our financial system, we must start with our economy and the whole situation, and grasp both urban finances and county (district) finances. In Shanxi, there are 114 county-level (district-level) financial departments. At present, 62 counties (districts) survive on subsidies, with 31 of them subsidized by the central authorities. How are we to give play

to the initiative of county-level financial departments? How are we to give play to the role of economic radiation by our key cities? How are we to speed up the economic development of our counties (districts)? How are we to enable our county-level finances to be self-supporting without relying on subsidies? These questions are worth studying in order to bring about a radical turn for the better in our financial situation.

3. In carrying out our financial reform, we must put an end to the practice of the financial department collecting all the revenue and funding all the expenditures and satisfactorily grasp financial management. This is the key to the transformation of our financial work. Since we streamlined our administration and decentralized power, our financial departments have abolished the practice of "the state taking on everything," adopted the methods of "maintaining ownership by the whole people, operating by collectives, paying taxes according to regulations, and shouldering sole responsibility for profits and losses" for our small enterprises owned by the whole people. In their financial management system, they have implemented the principle of "classifying taxes, assessing income and expenditure, and assigning all-round responsibility by contracts level by level," granted our enterprises power over their production and operations; and linked wages with amounts of tax payments and profit delivery, thus stressing the task of management.

4. Our new financial work should treat equally the sector owned by the whole people and the collective and individual sectors without discrimination. Under the situation of a planned commodity economy, both collective and individual economic sectors are indispensable and we must do away with the previous traditional concept of administering only the enterprises owned by the whole people. We should give the green light to any production or operation activity that is conducive to increasing our revenue and has relatively high economic results and social benefit, and treat all such activities equally.

5. We should do away with the old regulations and practices related to the policy of closing our country to international intercourse. In light of our policy of opening up to the outside world and enlivening the domestic economy, we should "fight out" and "draw in." By fighting out, we mean that we should vigorously support and develop the production of the products that can earn foreign exchange, occupy the international market, and heighten our foreign exchange earning capacity. By drawing in, we mean that we should use the advantages of natural resources, personnel, and geographic location of all countries, emancipate our minds, and adopt vigorous measures to draw in foreign capital and import advanced technology and management knowhow. Toward this end, we should reform our financial work in accordance with the principle of totality and comprehensiveness, really turn the supply-type system into the administration-management type, and thus promote the reform in our entire economic system.

II. An Administration-Management-Type Financial System Is the Objective Demand of Our Planned Commodity Economy

The resolution on economic structural reform approved by the 3d Plenary Session of the 12th CPC Central Committee marks a new level of our party's understanding of our country's national conditions and the law governing socialist economic construction, and indicates that our country's economic life has begun to shift to the orbit of a planned commodity economy. This new situation has given rise to a series of new changes in our financial work which have a dominant position in our distribution sphere. Our financial work is faced with new issues such as the questions of how we are to correctly handle the relationship between budgetary and extrabudgetary funds and between accumulation and consumption and how we are to make an all-round application of our economic levers and regulatory means, intensify macroeconomic control while enlivening our microeconomy, and establish our social insurance system. In order to satisfactorily deal with these new issues, we must clarify the following ideas:

1. Our country's commodity economy is different from both a simple commodity economy and a capitalist commodity economy, and is a planned commodity economy. As cells of this national economy, our enterprises should operate independently, shoulder sole responsibility for their profits and losses and have certain decisionmaking powers. However, from the point of view of the planned commodity economy, the state must exercise necessary macroeconomic control and regulation. In this area, finance is an economic lever directly controlled by the state and all aspects of our economic life will finally be reflected in our finance work. Therefore, in order to do their financial work well, our financial departments should foster a sense of the market. This is not merely a problem related to understanding nor a problem that can be solved by merely making these departments realize the importance of the market. We must realize that our economic life is becoming increasingly complicated and that only by mastering and applying scientific research methods and modern calculation tools can our financial departments get accurate data. They should also closely monitor the trend of the market at home and abroad and inside and outside the province or region and acquire new information. On the one hand, they should provide correct information and guiding opinions for our enterprises, and on the other hand, they should protect the consumers' interests through participating in the state's market regulation and applying economic means, give full play to the role of the law of value, and thus manage to be skillful in achieving financial growth and accumulating funds and moderate in spending.

2. The goal of our economic structural reform is to develop our social productive forces. The transformation of our financial work must closely be centered around this goal. Toward this end, our financial departments must first correctly understand the dialectic relationships between production and distribution and between economy and finance, foster the idea that "economy determines finance," and make all our financial cadres understand that "we should increase our revenue by developing our national economy." This is the fundamental principle for us in establishing an administration-management-type finance. Second, we should increase our investment in the technological transformation of our industrial enterprises and in the development of commodity production, gradually turn our supply-type expenditure composition into a construction-type expenditure composition, follow the path of carrying out expanded reproduction mainly by intention, and augment the vitality and reserve strength of our enterprises. In this area, we should not neglect overcoming the malpractice of the collective and individual sectors, or the malpractice of focusing on industry and agriculture while neglecting our tertiary

industry. Our financial departments should create equal external conditions for all enterprises to compete with one another and treat them equally without any discrimination. Third, we should pay close attention to controlling the input of products. This is where an administration-management-type finance differs diametrically from a supply-type economy. Our financial departments should know how to use their limited funds early or later, in large or small amounts, quickly or slowly, and urgently or at ease. They should make the best use of their funds and invest the funds in the key projects that have advantages and can yield new sources of finance. In order to obtain the above knowhow, in addition to correcting their vocational guiding thought, they should radically change their thoughts, style, and work. In other words, they should get out of their offices, go deeply into reality and among the lower levels, do a good job in investigations and studies, and pay attention to increasing the yield of funds and the ways to accumulate and use funds. Of all these, the most important is increasing the yield of funds. Fourth, we should do a good job of drawing in foreign capital and satisfactorily importing advanced technology and management knowhow. An administration-management-type finance should satisfactorily make both long-term and short-term plans in light of the limitations of our current financial capacity, the capacity of our enterprises to assimilate technology, and the masses' capacity to shoulder the burden.

3. Since the separation between the functions of government and those of enterprises, some government departments "have returned power to enterprises," others "have given some power to enterprises," and still others have "shared some of their power with enterprises." In the future, the major duties for our functional departments of economic administration are to discuss major issues, monitor the whole situation, satisfactorily impose macroeconomic control, and make our national economy develop along a path of healthy and harmonized development. Under these circumstances, our financial departments which have dual functions should formulate comprehensive financial plans, correctly guide the direction of the flow and the movement of our funds, and coordinate the spending of funds to ensure full provision of funds for each project. We should ensure that this task has been put on the agenda of the financial departments at all levels.

III. Strengthening a Sense of the Legal System Is a Guarantee for the Actual Establishment of an Administration-Management-Type Financial System

Lenin said: "If it is the will of the state, it should be written into the law formulated by the organs of the state power; otherwise, the word 'will' will become meaningless." As we are transforming our supply-type finance into an administration-management-type finance, strengthening our sense of the legal system and eliminating the practice of acting according to officials' will in disregard of the law are of particularly great practical importance for the realization of this great transformation.

1. From the point of view that finance is the financial pillar for the state in performing its functions, since the emergence of states, all states--slave, feudal, capitalist, or even socialist ones--have had to rely on the support of their financial system before they can fully perform their political and

economic functions. In the future, under a socialist commodity economy, although we should relatively soften our mandatory plans and continue to expand the scope of our guidance plans, this does not mean that we are to abolish all plans or all our mandatory plans. Therefore, there is a trend for the state to increasingly intensify its functions in intervening social economic life. Judging by the problems that cropped up in our country's economic life in the fourth quarter of 1984, the transition from the old to the new system and the interference of new unhealthy practices were two of the reasons for the emergence of the problems, but the imperfect legal system was also an important cause. For example, our enterprises owned by the whole people shoulder only contracted responsibility for their profits but not for their losses. If we fail to formulate an enterprise bankruptcy law, it will be difficult to radically do away with the practice of "eating out of the same big pot" or to really make our enterprises shoulder sole responsibility for their profits and losses. For another example, there are many causes for the excessive distribution of the national income. Among these causes, there may be excessive distribution conducted by our financial departments and banks through incurring financial deficits and expanding credit. If we fail to formulate a Central Bank law and a state budget law, even the reports of budget and final accounts approved by NPC sessions will often fail to be implemented.

2. A comprehensive review of world history reveals that the success of most reforms relies on the guarantees of the law. Since the founding of the PRC, in particular since the 3d Plenary Session of the 11th CPC Central Committee, the relevant departments have done lots of work related to our financial and economic legislation and promulgated many important financial and economic laws and regulations. This has played an important role in imposing our financial law and discipline and ensuring the smooth progress of the financial distribution activities. But we should also see that as our commodity economy quickly and drastically develops and as we carry out major reforms in the state's economic life, our country's work of economic and financial legislation may still fail to satisfy the demands of the development of the situation and should be further improved. The major problems now are: 1) The existing law is not followed or implemented. In some areas, departments, and units, the phenomena of "substituting somebody's words for law," "substituting power for law," "substituting administration for law," and "substituting personal position, prestige, or relationships for law" often emerge. 2) There is no law to follow. In many aspects of our country's economic and financial life, most of the rules and regulations continue to be in the form of government or departmental notices, instructions, provisional (draft) regulations, opinions, methods, and so on, which paly some restrictive role but lack the binding force of law because of reshuffles of officials or other reasons. In our economic life, we often see the practice of telling offenders "not to repeat the offenses" or "handling cases according to the degree of seriousness of the offenses." This often enables offenders to get off with light punishment for serious offenses or even no punishment for minor offenses.

In order to realize a transformation in our financial work, first, the relevant legislative departments should accelerate the pace of establishing our financial laws and regulations, and gradually establish an integrated system of financial and economic laws and regulations with Chinese characteristics, thus enabling people to have laws to follow and put our financial and economic work under the restrictions and control of law. Second, we should clarify the scope of power for our various functional departments and solve the problems in an all-round manner. Financial laws and regulations are a comprehensive concept and are related to all aspects of our national economy. This requires us to strictly distinguish between the functions of various departments, including our financial, auditing, and taxation departments, banks, economic commission, planning commission, and other relevant departments; to strengthen the relations between them; to straighten out our national economy in an all-round manner; to punish violations of discipline severely by means of criticism, education, and economic, legal, and administrative punishment; and to conduct administration and supervision, and so on. Third, we should persist in implementing the principle that "all people are equal before the law," and truly carry out the maxim "a prince is punished like an ordinary person when he commits a crime" in order to ensure the dignity of law. In this sphere, an important issue is to give our departments of administration of law real power of office and refrain from giving them only the power of "putting forward proposals" but not the power to "make decisions" in order to avoid the malpractice of the law being promulgated by many departments, punishing people without authorization, and substituting party for government or government for law. We should firmly establish a sense of administrative discipline and law among all our people and thus enable our state to take a heartening step forward toward the establishment of a perfect legal system, to really embody its will in its law, and to provide a guarantee for the actual realization of an administration-management-style financial system.

ECONOMIC MANAGEMENT

SUMMARY OF CHINA'S SECOND NATIONAL INDUSTRIAL SURVEY

Hong Kong CHING-CHI TAO-PAO [ECONOMIC REPORTER] in Chinese No 1-2, 1 Jan 86 pp 63-65

[Article by Xu Gang [6079 0474], Deputy Chief of National Industrial Survey Group and concurrently Director of National Industrial Survey Office of the State Council: "Summary of China's Second National Industrial Survey"]

[Text] In November 1983, the State Council of PRC decided to start its second national industrial survey in 1986. The scope of this industrial survey will be unsurpassed since the founding of the People's Republic (the first survey being held in 1950 shortly after the founding of New China). It will be an important survey on the national resources as well as a very important basic task in building socialism with Chinese characteristics. This survey will cover 400,000-500,000 industrial enterprises with independent accounting, rural enterprises, and industrial undertakings by private individuals. Such a large-scale survey is not only unprecedent in China, but also rarely seen in the world. Since this survey will have to meet many requirements and cover many fields, it will be more complex and difficult than the surveys of many developed countries which have been conducted many times at 10 year intervals.

Purpose and Task of Industrial Survey

The purpose and task of this industrial survey is to ascertain the available industrial resources and to provide fairly comprehensive and detailed basic data for the formulation of long-range plans, including the plans for the transformation of various trades; for readjusting and streamlining the various relationships, including the proportionate relationship; for reforming the structure, and expanding international economic contacts and cooperation in line with the policy of opening the country to the outside world and invigorating the economy at home; for consolidating and improving the macroeconomic management and the operation and management of enterprises; and for bringing about better economic results for the society and the enterprises and promoting the development of national industry and the entire society and economy. In short, its purpose is to attain the strategic objective of making the country fairly well-off by the turn of the century and accelerating the four modernizations, particularly the industrial modernization.

The long-range plans and the policy of readjustment, restructuring, consolidation and improvement have but one common purpose, namely the development of productive forces. There are three methods to accomplish this purpose: first, the building or expansion of a number of enterprises; second, technical transformation and equipment renovation for the existing enterprises; and third, improvement of the enterprises' quality and their management, and fully tapping their internal resources. The first is an extensive method, and the other two are intensive ones. All these three are important, and none of them can be lacking, although under different conditions, they may be in a different priority order. Funds are required for any of these three methods. In comparison, however, more funds are required in the building and expansion of enterprises, and the investment returns are slower. The transformation of old enterprises costs less and shows quicker results, while the improvement of business management costs the least and shows the quickest results. Based on the existing realities, therefore, how should we handle the relationships between these three methods and arrange their priority order? This is an important question which deserves careful study.

First, for a very long time in the past, investment was concentrated on the building and expansion of enterprises, resulting in the appearance of many enterprises which gave very good performances. The number of industrial enterprises and unit has been increased from some 100,000 shortly after the founding of the People's Republic to more than 400,000, while the value of their fixed assets has increased several dozen times over, and is expected to reach about 600 billion yuan by the end of 1985. The total industrial output value and the output of the major industrial products, such as steel, coal, electricity, cement, motor vehicles and so forth, have mostly increased scores or even hundreds of times. It is true that we have sometimes acted rashly in building and expanding enterprises and have wasted huge sums of money. However, in order to fill some gaps, to develop some new trades, and to strengthen certain weak links, the building and expansion of some enterprises are still necessary, although this would be difficult in view of the limited funds at the state's disposal.

Second, the present industrial setup in the country is quite large with a fairly complete range of trades. There is also a fairly complete industrial structure with a solid foundation. However, the technical equipment of these enterprises are mostly outdated and of the 1950 or 1960 vintage. These enterprises must be technically transformed and raised to the level of the 1970's or the early 1980's before their economic results and productive capacity can be appreciably improved. If we only invest in the building and expansion of enterprises and leave the existing enterprises without technical transformation, then these enterprises without technical transformation, then these 400,000-500,000 enterprises will become more and more technically backward, and it will be difficult for them to increase their output and to improve their economic results.

Third, the quality of the existing enterprises is poor and the standard of management for most of them is very low. We must improve their management, raise the morale and technical competence of their workers, strictly enforce some responsibility system, strengthen the basic work of economic accounting, and attach great importance to information so as to avoid any rash action in production. By this means, we will be able to achieve better coordination in all phases of work among the different posts of production, increase the efficiency of operation, make full use of the equipment of production, constantly update our products, continue to improve their quality, greatly reduce the consumption of energy and raw materials, raise the labor productivity, lower the production costs, and gradually set up rational prices to increase our power of competition. This method is much more effective than the other two in money-saving, and we can increase the productive capacity of the enterprises by tapping their internal resources. This is the best method of obtaining more output with less input. If we make no effort to raise the standard of management, then it would be difficult for the industry to develop in a rapid and healthy way, even though we build more enterprises with advanced technical equipment. Backward management can never function in harmony with advanced technology, and this lack of harmony will certainly bring serious losses. There is a very close relationship between technology and management, and advanced technology calls for advanced and scientific management. If the "hardware" does not match with the "software," then the advanced technology can only become a burden and the cause of very serious waste.

The policy of technical transformation for the existing enterprises was stressed in the Sixth Five-Year Plan, and the investment in technical transformation was heavier than ever before. Great success was achieved in this respect during these 5 years. The "Proposal for the Seventh Five-Year Plan" also stressed the technical transformation of the existing enterprises, but went even further in dealing with the problem of raising the management standard. The cardinal principles concerning the relationships among the "three things" [mentioned in the "Proposal"] has been basically determined. To ensure the implementation of these principles, we must work out a series of concrete policies, measures, plans and steps of implementation concerning the way to distribute the limited funds and to use these funds rationally and to the best advantage; and the way to do our work well in these "three things" in order that each of them can play a full role. They include the orientation of investment in new construction projects, the proportion of investment distribution among different trades and products and their priority order, the actual sizes of projects and the seldction of their sites, the allocation of funds for technical transformation, the plan of technical transformation for each trade, each enterprise and each set of equipment and the order of transformation, the allocation of funds for developing new products, improving quality, reducing consumption, raising labor productivity, expanding the productive capacity, and technical transformation in other areas. Of particular importance is the way to ensure that funds for technical transformation are not diverted to the building and expansion of enterprises and the way to strengthen the management, including the training of workers (and first of all the leading personnel), the standardization of measurements, the rational readjustment and full utilization of equipment, the responsibility system, the quota management, and so forth. The solution of all these problems must be realistic. These problems have been fairly fully covered in this industrial survey which will be able to supply data in fairly great details.

Contents of the Industrial Survey

The contents of the industrial survey are dictated by its purpose and task. According to the State Council's directive, this industrial survey should be mainly concerned with the technical conditions of the industrial equipment, the economic results, the various internal structures of industry and the workers conditions besides showing the basic industrial conditions and a complete picture of the industrial economy. The contents of the survey are accordingly as flows: in production, the total output value, net output value, the quantity and quality of products and labor productivity; in marketing, the total sales proceeds, the sales volume for each variety of product, the prices and the monetary figures; in supplies, the supply and consumption of various types of energy and raw materials; in labor and personnel, the number and sex of workers, their nationality, age, educational background, and technical standards; in wages, the total payroll, the average wages and the composition of the total payroll, in financial costs, the fixed assets (and their original and net value), the circulating funds (including current funds for finished products, reserve funds and so forth), profits, taxes, the distribution and use of profits retained by the enterpries, production cost, marketing cost, and the composition of cost (which can be classified into two major categories of living labor and materialized labor; in equipment, the amount owned, the amount installed, the service life, the technical grades (in four grades), the productive capacity and the utilization rate; and so forth, totaling more than 300 indices. The tables of contents in the survey forms are of many kinds, and the contents are given in fairly great details. For example, there are more than 500 processing trades (mainly shown in the comprehensive tables of output value, labor wages, financial and costs and so forth); more than 5,000 types of products and equipment (mainly shown in the production, marketing and equipment survey tables); and more than 1,000 types of products for which the costs and prices should be filled in and reported. The tables of contents for those products whose quality standards must be reported, and for the output and consumption of energy and raw materials, which must also be reported, are all in farily great details. In addition, there are still hundreds of technical and economic indices included. On the whole, the contents of this industrial survey are very comprehensive, dealing with all the economic activities of the enterprises. Such details have never been seen in the monthly, quaterly or annual statistics.

The processing of these survey data is not merely a simple summarization of the basic figures reported by the enterprises. It must be based on the requirements of research in the solution of problems and the making of policy decisions. Some special topics may also be selected for intricate and cross processing by different groups. In other words, the purpose of these numerical data processing is not to present a voluminous report. More important still, these reports must be deep-going enough to reveal the essence of problems. This survey calls for comprehensive reports from not only the 29 provinces, autonomous regions and municipalities directly under the central government (excepting Taiwan, Hong Kong and Macao), but also from more than 200 cities and some 2,000 counties. By this means, we will be able to obtain more detailed materials from each area. Furthermore, we can compile the most accurate and detailed directory, including brief introductions, of the enterprises in all trades ever published since the founding of the People's Republic.

Steps in the Work of Industrial Survey

According to the State Council's directive, all preparations should be completed before the end of 1985, and the survey and registrations will formally begin in the first quarter of 1986. This will be followed by the processing, study, analysis, compilation and publication of the data.

The preparations which have been going on for more than 2 years are mainly as follows:

1. The establishment of leading organs and offices at all levels for the industrial survey. In November 1983, the State Council decided to form a leading group for the national industrial survey in the State Council. State Council Councilor Zhang Jingfu [1728 0513 1133] was appointed chief of the group, and one person each was appointed by the State Economic Commission, the State Planning Commission, the Ministry of Finance, the All-China Federation of Trade Unions to serve as deputy chiefs. The leading group has an office in which to carry on its daily routine work--the Industrial Survey Office. The governments at all levels, the departments in charge of various trades, and all the enterprises have also formed their survey leading groups and their offices, and the groups are headed by the vice ministers, vice governors, vice mayors, vice county magistrates, or vice managers (or vice factory directors). It is so arranged, simply because the task is too arduous for the statistical bureau alone. Thus the existence of strong leading bodies and offices at every level made it possible to guarantee the completion of the task organizationally.

2. The formulation of programs of implementation and work plans for the survey. The final draft of this program was based on investigations and study, the opinions in various quarters, experiments in enterprises, and the observations of people dispatched to the United Nations and the friendly countries where they studied the foreign programs of industrial surveys and learned from such experiences as are useful for China. That is why these plans are practical and suitable for the actual conditions in China.

3. Conducting snow-balling experiments. First, in the second half of 1984, all ministries, provinces, autonomous regions and municipalities directly under the central government held a unified nationwide experiment in Changzhou City, Suzhou. Then in the first half of 1985, all provinces, regions and municipalities chose one or two cities or counties (or municipal districtes) where industry is fairly concentrated under their own jurisdiction, while the ministries chose one trade or some enterprises, for their experiments. finally, in the third quarter of 1985, all cities and counties chose one or two enterprises for the same purpose. These snow-balling experiments enabled

the leadership at various levels to obtain the necessary experience for conducting the survey well, and the experiences of certain units were quickly popularized in areas with hundreds of cities, thousands of counties, and hundreds of thousands of enterprises. This was like fighting a battle, and the commanders cannot learn how to direct the operations without a series of military exercises.

4. Large-scale training of survey personnel. In order that all survey personnel will consciously and actively perform their duty, training classes must be held for them. They must understand the reason for the industrial survey to be conducted, the purpose and significance of the survey, the contents of the survey, and the way for this task to be accomplished. In other words, they must understand the items to be surveyed, their significance and uses, and the way to evaluate them. The training must be strict and intensive, and the trainees must pass a test, or be trained again in case they failed to pass it. To meet this requirement, we must adopt the method of cooperation and division of work among the localities and departments in charge by conducting training at every level. First, in April 1985, training was conducted for the backbone elements of all ministries and provinces. These backbone elements then trained the survey personnel of cities and counties, and these survey personnel in turn trained their counterparts in the enterprises. After half year's efforts, according to incomplete statistics, 1.6 million persons were trained in the country. This was a training course not only for cadres in industrial survey, but also for the administrators of enterprises.

5. The basic work of economic accounting in consolidating the enterprises. This work was attended to jointly by the industrial survey offices and the enterprise consolidation office. Its main features are: (1) to strengthen and perfect the means of measurement and monitoring in all aspects in order to guarantee accuracy; (2) to establish and strengthen various systems of first-hand recording, accounting, card-indexing and filing; (3) to strengthen quota management; and (4) to ascertain the conditions of equipment and productive capacity, in case of ambiguity. The consolidation of enterprises in more than 1 year helped strengthened the basic work which greatly raised the standards of their operation and management.

6. Checking up the enterprises and units. In order that not a single enterprise will be left out or duplicated during this survey, each city or county conducted a check-up at the beginning of 1985 on all the enterprises which actually existed at the end of 1984, and then compiled lists of them on this basis. Since certain changes may have occurred among the enterprises in 1985, the localities will again check them against these lists by the end of 1985. The enterprises which were newly opened, closed, or merged during that year will be added, delayed or readjusted in the list accordingly. The list will be based on facts and will guarantee the authenticity of the units to be surveyed.

7. Trial completion of survey forms. This experiment was conducted in October-November 1985 for the purpose of reviewing the preparatory work in an earlier stage and laying a good foundation for the work in the coming

year when these forms will be formally completed. The trial completions were mainly based on the statistics in the first 3 quarters of 1985. In the form, the figures for 1980 and 1984 must have been verified. The trial forms need not be consolidated, but must be carefully examined at all levels. In the case of an error, the enterprise concerned should be responsible for its correction. In fact, this trial completion of the survey form should be the beginning of the formal survey in 1986, because if the figures for the 4 quarters of 1985 can be entered into the form in advance, there is no need to wait until the beginning of 1986, and only the figures for the fourth quarter of 1985 have to be set in order at the beginning of 1986. Thus the enterprise will hold the initiative in the work of 1986. This trial completion of form is in fact a dressed rehearsal for the formal survey, or a military exercise. It is an extremely important measure to ensure the accuracy of the data during the formal survey.

8. Stepping up publicity work. In order to acquaint the leadership at all levels and the broad masses with the great significance of the industrial survey, and to enlist their support, we have made use of many different publicity media, including XINHUA NEWS AGENCY, the press, radio, television, posters, projection slides and so forth in our publicity work with fairly good results.

After more than 2 years intensive labor, all the required preparations have been basically completed. Although a few units have not prepared their work well enough, the organs of industrial survey at all levels are taking active measures to strengthen the weak links. With the New Year's approach, all the industrial survey personnel are full of enthusiasm and confidence in greeting the arrival a gigantic system engineering project--the industrial survey.

FINANCE AND BANKING

ASIAN DEVELOPMENT BANK MEMBERSHIP EXPLAINED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 4, 4 Apr 86, pp 23-24

[Article: "Person-in-Charge in Foreign Affairs Bureau of Chinese People's Bank Answers Reporter's Questions on China's Joining the Asian Development Bank"]

[Text] Question: What procedures have been completed for China to join the Asian Development Bank (or Asian Bank, for short).

Answer: On 28 November 1985, Chinese People's Bank Director Chen Muhua [7115 1970 5478] applied, on behalf of the Chinese government, to become a shareholder in the Asian Bank. On 17 February 1986, the Asian Bank's board of directors approved resolution number 176 admitting China to the Asian Bank. China then completed the following three procedures for joining the bank: (1) Deposited with the Asian Bank the Chinese government's instrument of acceptance accepting the "Agreement on Establishment of the Asian Development Bank." (2) Deposited with the Asian Bank a "Legal Opinion" attesting that China had signed the foregoing agreement in accordance with domestic legal procedures, and had taken required legal actions to carry out the foregoing agreement and obligations stipulated by the Asian Bank Council pertaining to China's acceptance into the bank. (3) Tendered the first capital stock installment of $17,130 in renminbi. On 10 March, Asian Bank authorities informed China that it had formally become a member of the Asian Bank.

Question: How many members does the Asian Bank have, and why do some countries that are not in Asia or Oceania join the Asian Bank?

Answer: As of the present time, the Asian bank has 47 members, including China, of whom 32 are members from Asia and Oceania and 15 are from areas other than Asia and Oceania. In accordance with provisions of the Asian Bank charter, developed countries outside of Asia and Oceania that are members of the United Nations and its special organizations may also participate in the Asian Bank. Countries in this category who are currently members of the Asian Bank are Australia, Belgium, Canada, Denmark, Finland, France, the German Federal Republic, Italy, Holland, Norway, Spain, Sweden, Switzerland, the United Kingdom, and the United States.

Question: Has the Chinese People's Bank already established relations with the Asian Bank?

Answer: The Chinese government has appointed Chinese People's Bank Director Chen Muhua as the Chinese director of the Asian Development Bank, plus the chairman of the board of directors and concurrently director of the foreign bureau of the Chinese People's Bank, Che Peiqin [6508 1014 2953], as the deputy director. The Chinese People's Bank is the official liaison organization of the Asian Bank in China, and it is also a storage bank for the Asian Bank, with responsibility for storing the renminbi and other assets held by the Asian Bank. The Chinese People's Bank has already established a professional relationship with the Asian Bank.

Question: After joining the Asian Bank, will China send people to work in the Asian Bank?

China owns 114,000 shares of Asian Bank stock valued at approximately $1.155 billion or approximately 7 percent of the total number of Asian Bank shares for third place among the bank's 47 members. Thus, China qualifies to assign independently a permanent director and deputy director at the bank's headquarters. The timing of the assignment is being discussed now.

It is understood that, in principle, applications for employment at the Asian Bank are publicly invited from among members, there being no allotted numbers. However, while bearing in mind the professional skills that those to be hired should possess, the widespread area covered by the bank should also be taken into consideration insofar as possible, and at the time of employment, the member's government and the views of the central bank should be consulted. Currently the Asian Bank has 1,535 employees, 574 of whom are professional staff and 961 of whom are assistants. Now that China is a member of the bank, preparations are in train for recommending some qualified personnel for employment.

Question: What kinds of specialized professional personnel does the Bank require?

Answer: The Asian Bank has advised that the main professional work of the bank is to provide loans for construction and development projects of developing member countries in this region; thus, the professional personnel it hires have very many specialties. These include law, the secretarial field, national economics, development policies, fisheries, forestry, animal husbandry, education, health, urban development, chemical industries, civil construction, electrical machinery, irrigation, machinery, mining, transportation, water supply, geology, energy, small industries, financial analysis, development banking, credit management, budgeting, planning, auditing, finance, storekeeping, systems programing, statistics, electronic computers, evaluations, economics, news, and economic editing.

Question: Will China attend the next annual board of directors meeting of the Asian bank. Please provide some information about the status of the Asian Bank board of directors.

Answer: The board of directors is the Asian Bank's supreme policy organization and is composed of one director and a deputy director appointed by each Asian Bank member nation. Most directors are heads of central banks or ministers of finance. The board of directors holds an annual meeting each year. Participants in the annual board of directors meeting include not only delegations sent by bank members, but also representatives of numerous international economic and monetary organizations and of commercial banks. Reportedly, more than 1,000 people attend the meetings.

The 19th annual meeting of the board of directors of the Asian Bank will be held from 30 April through 2 May 1986 at Manila, the capital of the Philippine Islands. China will send a delegation headed by Chen Muhua, member of the State Council and concurrently director of the Chinese People's Bank and Chinese manager of the Asian Bank. The delegation will be made up of people from relevant fields in China, including the Chinese deputy manager of the Asian Bank. During the session, China's delegation will meet friends from monetary circles of all countries and friends from international monetary organizations. This is a very good opportunity to exchange views on the international economic and monetary situation.

IMPORTANCE OF PAYING TAXES STRESSED

Beijing JINGJI RIBAO in Chinese 27 Oct 85 p 1

[Article: "Strengthen the Concept of Paying Taxes"]

[Text] China's tax laws have been passed by the NPC or promulgated by the State Council under the powers conferred upon it by the NPC. They are a major integral part of the country's laws, which everyone must observe. For a long time, an overwhelming majority of enterprises, units and individuals have voluntarily done their duty to pay taxes according to law, making a contribution to the four modernizations.

There have been some enterprises, units and individuals, however, whose concepts of law and discipline regarding tax payments are dim. They have purposely evaded or cheated on their taxes, or they have even refused to pay taxes. Some areas and units have done things other than in accordance with unified provisions of the tax law, have acted on their own volition to change tax rates, or have unauthorizedly decided on tax reductions or exemptions. Such illegal and undisciplined behavior has not only reduced China's tax revenues and adversely affected use of the role of tax collection economic levers, but has also interfered with reform and damaged Party spirit and the social atmosphere. Consequently, in the process of carrying out reform of the economic system, it is extremely necessary to genuinely strengthen concepts of the law and increase consciousness about carrying out national tax laws.

Strengthening of concepts about tax laws requires, first of all, a realization that tax revenues play an important role in the four modernizations. For a long time to come, our most important mission will be the concentration of forces to carry out modernization to satisfy the material and cultural needs of the people's daily life. Modernization will take money. Success in modernization will depend on success in accumulating funds, and the amount of funds accumulated with determine the amount of modernization. The recently convened national party congress noted in the proposal it put forward to draw up the Seventh 5-year Plan that realization of the Seventh 5-year Plan's goals for struggle will require adoption of six programs, the third of which is "amassing of financial, material and technical forces to build a group of key projects for energy, transportation, communications and the raw and finished materials industries." Tax revenues are the country's principal source of financial income. During the 36 years since fouunding of the People's

Republic, the country has accumulated a total of nearly 1 trillion yuan through industrial and commercial taxes. This figure is of huge significance for the building of socialism. So one might say that payment of taxes according to law is not solely a a vocational problem and a legal problem, but that it is also closely connected to the welfare of the state and the magnificent cause of socialism. If a blind eye is turned toward tax evasion, tax cheating and unauthorized tax reductions and exemptions and no halt put to them, the country's sources of money will be interrupted, and the amassing of financial strength for key construction and to raise the standard of living will become an empty phrase.

One must also realize that the tax collection issue also ramifies into whether reforms can be carried out smoothly. In the course of reform of the economic system, it is both necessary to open up and liberalize the micro-economy and also necessary to bolster management and control of the macro-economy. Enlivening of the economy is reform, and bolstering management and control of the macro-economy as necessary is also reform. Once enterprises in the micro-economy have been enlivened, tax collections become an important economic and legal measure for the state to use in bolstering control and management of the macro-economy. Right now, tax levies and exemptions, readjustment of tax rates and such means are being used in coordination with other measures to control the size of investment in capital construction and excessive inflation of consumption funds so that the country's economy will have sustained, stable and coordinated development.

Strengthening of tax law concepts requires correct handling of the relationship between rights and duties. All rights have been given the citizens by the constitution and laws, while at the same time all citizens are required to perform the various duties provided in the constitution and laws. This includes payment of taxes according to law, which is one of the glorious duties that a citizen in a socialist country should perform to the fullest. All tax paying units and individual should pay their taxes on time and in full. Strengthening of concepts of the tax laws also requires correct handling of relations between the central and local governments, and relations of parts to the whole. Party and government leaders at all levels represent the interests of the Party and the country, and they must firmly establish a psychology of viewing the whole country as a chessboard. Today, some tax paying units and individual taxpayers do not proceed from the overall situation to work with one heart and one mind to do a good job in economic work and reform. Instead, they do everything possible to find loopholes in national policies and incomplete reforms to gain benefits for their own units or themselves. Large scale tax evasion and tax cheating, and unauthorized tax reductions or exemptions damage the interests of the Party and the country, and this is extremely wrong.

Right now a large scale investigation of tax collections and financial matters is underway. Instances of tax evasion, tax cheating and unauthorized tax reductions and exemptions must be assiduously looked into and corrected. This broad investigation is an education of universal application for the whole body of cadres in obedience to discipline, adherence to the law and strengthening of concepts about paying taxes. Violations of tax payment laws will certainly be severely punished. Anyone who has violated tax laws will have to be straightened out and, depending on the seriousness of the violation, the violator will bear economic responsibility, legal responsibility, or will be punished by the Party or the government. This is the only way to bring about a new social atmosphere. Payment of taxes according to law is an honor!

INDUSTRY

EFFORTS TO UPGRADE METALLURGICAL INDUSTRIES DISCUSSED

Fuzhou FUJIAN RIBAO in Chinese 4 Apr 86 p 1

[Article by Chen Minzhen [7115 2404 4176]: "Cooperation wth Scientific Research Forces in Other Provinces To Hasten the Translation of Discoveries into Productivity. Provincial Metallurgical Industry Research Institute Has Completed 23 Scientific Research Projects"]

[Text] As a result of having given serious attention to cooperation with scientific and technical forces in other provinces, the Fujian Provincial Metallurgical Industry Research Institute has completed 23 scientific research projects, including new technology of oxygen enriched air blast copper smelting and brine refining of magnesium for which it received a science and technology achievement award from the Ministry of Metallurgical Industry.

Faced with a shortage of skilled personnel and equipment, the Provincial Metallurgy Research Institute made certain to bring in permanent scientific research cadres from elsewhere and devised means to identify difficult problems in plants and mines. Fujian Province's wolfram reserves are the fourth largest in the country, yet the province annually buys between 10 and 20 tons of tungsten contact materials. Scientific research personnel brought in from the Rare Metals Processing Research Institute at Baoji sought the assistance of existing units and obtained their support. For more than 2 years, not only has the Baoji institute provided Fujian's metallurgy institute with advanced equipment and detection methods, but it has also sent five permanent technical cadres to cooperate in research and development. In January 1986 evaluation of the tungsten contact materials showed their quality to to be at the advanced domestic level. Scientific and technical personnel from the provincial metallurgy institute also traveled to Baoji to study titanium production and new scientific research techniques. Assistant engineer Rao Liangshi [7437 2733 4258] used titanium materials to research and develop titanium heating tubes, which were integrated into electrically controlled equipment that is not only able to maintain sea water at a constant temperature but is also able to avoid pollution. This equipment is now used widely in the breeding of prawns. This instituted also cooperated with scientific research personnel in the Shenyang Smelting Plant, the Changsha Ore Smelting Research Academy, the Guiyang Aluminum and Magnesium Design Institute, and the Beijing Nonferrous Academy, and used equipment at the Shaowu Smelting Plant, the Xiamen Magnesium Electrolysis Plant and the chemistry department of Overseas Chinese University to produce new technologies of enriched oxygen air blast refining of copper and brine refining of magnesium. Comrades in the analysis office trained nearly 100 persons at the basic level in plants and mines in laboratory testing. They improved their conventional analytical skills to compensate for equipment deficiencies and insure quality of exports of metallurgical products. They have now purchased more than 100,000 yuan worth of urgently needed equipment using income derived from technical services they have provided and from transfers of technology. New techologies and new problems in powder metallurgy, wear-resisting aluminum-silicon alloys, precious metal contact points and non-damaging flaw detection brought by the personnel who had been brought in are also in the process of being actively pursued to obtain early results.

The Fujian New Materials Development Company that was set up by the provincial metallurgy institute in conjunction with units concerned in Beijing and Baoji has also spread new techniques and new materials to six industrial plants in Xiamen, Fuzhou, and Ningde during the past year. They are now in process of importing new materials production lines from other provinces to answer the needs of the electronics industry in Fujian Province for copper foil used in electrolysis and high performance welding tin. They also want to continue cooperation with other provinces to develop Fujian Province's wolfram, rare-earth metal, and fluorite mineral resources.

SMALL-SCALE ENTERPRISES

SHAANXI HOLDS MEETING ON TOWNSHIP ENTERPRISES

HK121516 Xian Shaanxi Provincial Service in Mandarin 2330 GMT 8 May 86

[Text] The 4-day experience exchanging meeting of counties, districts, and townships where town enterprise income has exceeded 100 million yuan concluded in Changan County on 8 May. The meeting commended 13 counties, districts, and townships where town enterprise income has exceeded 100 million yuan. Mou Lingsheng, deputy secretary of the provincial CPC committee, and provincial Vice Governor Xu Shanlin attended the meeting and spoke.

Despite insufficient funds, township enterprises developed rapidly in the province in 1985. The total output value of the province's township enterprises for 1985 amounted to some 4.98 billion yuan, accounting for 37.2 percent of the total rural output value. The net profit of the province's township enterprises for 1985 reached some 580 million yuan, an increase of 43.8 percent over 1984.

Mou Lingsheng and Xu Shanlin reviewed the status of the province's township enterprises and put forth several suggestions on the future development of township enterprises.

Mou Lingsheng said that although there are 13 counties, districts, and townships in the province where township enterprise income has exceeded 100 million yuan, the province is still backward in this respect compared with other provinces and cities. We must do all we can to catch up with them and give full play to our advantages. He said that to further develop township enterprises, the essential thing is to upgrade the quality of enterprises and make them competitive. It is necessary to solve the problem of poor business management and low technological level. We must use science and technology to arm and transform township enterprises. In places where township enterprises are fairly developed, attention should be paid to agricultural production. On the one hand, we must develop township enterprises; on the other hand, we must make full use of science and technology to strengthen agricultural production, develop industry to supplement agriculture, and boost both industry and agriculture.

Xu Shanlin said that when township enterprises have developed to a certain level, they must do the following: 1) decide on key products; 2) upgrade the management level of cadres and technological level of staff members and workers, and transform technological skills and equipment; and 3) strengthen lateral economic ties.

By visits and exchanging experiences, the participants further broaden their vision, emanicipate their minds, and strengthen their confidence. The 13 counties, districts, and townships where township enterprise income has exceeded 100 million yuan--Changan, Baoji, Huxian, Qishan, Weinan, Jingyang, Pucheng, and Fengxiang counties; Xian's (Weiyang), (Daoqiao), (Yanta) districts, and (Tanjia) Township; and Xianyang's (Qindu) District--made proposal to the meeting on launching a drive throughout the province this year of building counties where township enterprise income exceeds 100 million yuan.

The provincial government awarded silk banners to the 13 counties, districts, and townships.

SMALL-SCALE ENTERPRISES

HEILONGJIANG GOVERNOR ON DEVELOPMENT OF TOWNSHIP ENTERPRISES

SK111110 Harbin Heilongjiang Provincial Service in Mandarin 2100 GMT 10 May 86

[Text] In a speech at the provincial conference of directors of the bureaus in charge of township enterprises, Governor How Jie has urged all the staff members and workers of township enterprises throughout the province to have lofty ideals, work assiduously, and enable the total output value of the township enterprises throughout the province to reach approximately 10 billion yuan by the year 1990, which represents a 150-percent increase over that of 1985.

This conference was held in Zhaodong County by the provincial government, and it concluded on 10 May.

Thanks to our conscientious implementation of the four documents No 1 on rural work issued by the central authorities, profound changes have taken place in the rural economy, and township enterprises have also developed rapidly over the past few years. In 1985, the output value of the township enterprises of our province exceeded 4.5 billion yuan, registering a 57.9-percent growth over 1984. In the first quarter of this year, we still achieved fairly good results despite the influence of unfavorable factors, such as an acute shortage of funds. Compared with the same period of last year, the output value of the province's township enterprises grew by 33.7 percent, and the output of some major products also showed increases.

In order to fulfill this year's goal of achieving a 30-percent increase over last year in the output value of township enterprises, and in order to create favorable conditions for making the output value exceed 10 billion yuan by the year 1990, Governor Hou Jie urged: Leading persons at all levels should free themselves from the shackles of the traditional concepts on agriculture, and reorient their ideas toward the development of the commodity economy. They should render active support to the development of township enterprises, formulate rational plans for it, give correct guidance to it, and strengthen leadership over it. They should also help township enterpises define the direction and key areas of their development and make proper arrangements for them so as to acquire foresight and avoid ill-considered pursuits.

Governor Hou Jie also pointed out: In expediting the development of township enterprises, we should make a breakthrough by greatly developing the enterprises run by villages or households individually, or by several hous holds jointly. We should extensively organize various forms of associatio with the enterprises run by townships or villages leading those run by households either individually or jointly. In the meantime, township ente prises should also expand lateral economic ties to solve their problems in lacking technical know-how, in equipment and personnel, and in poor management, and to enhance their competence and competitive edges.

Governor Hou Jie also urged: In their efforts to develop township enterprises, all localities throughout the province should properly handle the relationship between equality and quantity, and between economic benefit and production growth rate. They should persistently strive to seek highe growth rate through increasing economic benefit, and higher quantity throu upgrading quality, and should produce more quality goods which is demanded by the market and which can yield higher economic benefit.

Speaking on how to serve the development of our province's township enterprises, Governor Hou Jie urged: All trades and professions and all departments should actively support the development of township enterprises with the principle of giving more service and less intervention. Proceeding from the need for cultivating tax sources, tax departments should work out as many preferential policies for township enterprises as possible. Industrial and commercial departments should relax restrictions on the scope of business of township enterprises and allow them to engage in diverse undertakings while focusing on one. Agricultural banks and credit departments should try their utmost to collect funds for township enterprises an help them use the funds flexibly. Supply departments should try their best to supply some raw materials to township enterprises. Various departments in charge of the production of various products should regard the support to township enterprises as their duty. Scientific and technological depar ments should conscientiously implement the spark plan, provide township enterprises with more scientific and technological findings which yield bet ter and quicker results, and actively render technical consultation and se vice to township enterprises.

Zhao Guozhen, director of the provincial township enterprise bureau, deliv a speech during the conference to sum up the previous work concerning towns enterprises. Participants to the conference also visited some township en prises in Zhaodong County.

CONSTRUCTION

RURAL HOUSING PLANS DISCUSSED AT CONFERENCE

Nanchang JIANGXI RIBAO in Chinese 25 Mar 86 p 2

[Article by Sun Xizhen [1327 1598 3791] "Further Gearing To Serve the Mass of the People. Province's Town and Village Construction Industries To Make Further Improvements During Seventh 5-year Plan"]

[Text] The following was obtained from the Jiangxi Provincial Town and Village Construction Work Conference that concluded on 21 March 1986. While making further improvements, the province's town and village construction enterprises are gearing to serve the masses better, and substantial development will take place during the Seventh 5-year Plan. By the year 1990, urban networks that vary in size and that are distributed equitably will be formed around large cities throughout the province, and intensified construction of basic municipal government facilities in cities and towns will make difficulties in finding housing, in boarding transportation, in obtaining potable water, and having a poor environment things of the past. Every urban resident will have an average of 6 square meters of living space and the number of people carried per public transportation vehicle will decline from 3,175 to 2,460. Running water will be supplied to 95 percent of residents, up from the present 80 percent, and per capita use of water will reach 175 liters per day. Thirty percent of urban areas will be covered with greenery. Construction of peasant housing in rural villages is to be maintained at approximately 30 million cubic meters per year, and storied dwellings will gradually increase to approximately 20 percent of all peasant housing.

Deputy Provincial Governor Jiang Zhuping [5592 4376 1627] attended the conference and gave a speech.

TIANJIN'S LI RUIHUAN GIVES GOVERNMENT WORK REPORT

SK170500 Tianjin TIANJIN RIBAO in Chinese 30 Apr 86 pp 1-3

[Government work report delivered by Li Ruihuan, mayor of Tianjin Municipality, at the 5th Session of the 10th Tianjin Municipal People's Congress on 22 April, entitled: "Sum Up Experiences, Advance on the Crest of Victory, and Work Hard in Order To Comprehensively Fulfill the 'Seventh 5-Year Plan'"]

[Text] Fellow Deputies:

The 5th session of the 10th Tianjin Municipal People's Congress is of great significance for our municipality's socialist modernization. On behalf of the municipal people's government, I now submit a report on the situation of the implementation of the "Sixth 5-Year" Plan and on the principal content of the "Seventh 5-Year" Plan to the session for examination and approval by the present session.

On Reviewing the Work of the "Sixth 5-Year" Plan Period

The "Sixth 5-Year" Plan period was an extraordinarily transitional period in Tianjin's history. Conscientiously reviewing and summing up the work done in this period is of great significance for consciously applying the basic experiences gained in the "Sixth 5-Year" Plan period to work out the "Seventh 5-Year" Plan, to upgrade the work of the "Seventh 5-Year" Plan period to a new level, and to win new and greater successes.

In the beginning of the "Sixth 5-Year" Plan period, we had many problems demanding prompt solution, such as healing the wounds left over by the 10 years' turmoil and restoring the houses and facilities damaged by the strong earthquake. The various sectors of the national economy were seriously imbalanced. The industrial and agricultural output was experiencing slow development. Hundreds of thousands of people became temporary shack-dwellers due to the fact that we lagged behind in urban construction. More than 400,000 young people were waiting for jobs. We started to implement the "Sixth 5-Year" Plan under such a difficult situation. Thanks to the concerted efforts of the people throughout the municipality under the direct leadership of the municipal CPC Committee and with the profound concern of the CPC Central Committee and the State Council, we surmounted various difficulties and scored successes one after another during the past 5 years. With the successes in fulfilling all major tasks and targets set in the "Sixth 5-Year" Plan, a new situation in which all fronts were prosperous was created. With notable changes in the situation, Tianjin entered a period of greater vitality than in any other 5-year period since the founding of the PRC.

During the "Sixth 5-Year" Plan period, a sustained, steady, and coordinated development of the national economy was realized thanks to persistently focusing on economic construction and paying attention to increasing the economic results. In 1985, the total industrial and agricultural output value reached 32.7 billion yuan, showing an increase of 57.4 percent over 1980 and registering an annual average increase of 9.5 percent. Of this, the total industrial output value increased by 50 percent and the total agricultural output value increased by 140 percent. The GNP reached 16.86 billion yuan, an increase of 69.9 percent over 1980 and representing an average annual increase of 10.2 percent. The national income reached 13.9 billion yuan, an increase of 49.3 percent over 1980 and an annual average increase of 8.3 percent. Revenue reversed the trend of increasing and declining. In 1985, when the prices of some raw materials rose, the portion of profits obtained by the enterprises increased, and the loans returned to the relevant units by the enterprises increased, revenue reached 4.59 billion yuan (including the newly added urban maintenance and construction taxes totaling 179 million yuan). When calculated in terms of comparable standards, revenue in 1985 showed an increase of 21.1 percent over that of 1984. The industrial and agricultural output value, sales volume, and revenue increased at the same pace in 1985. The output of most of the major industrial products covered by the "Sixth 5-Year" Plan increased, and some doubled or quadrupled. When comparing 1980 and 1985, the output of pig iron increased from 450,000 tons to 816,000 tons, that of petroleum increased from 397 million tons to 3.75 million tons, that of cement increased from 626,000 tons to 1.050 million tons, that of plate glass increased from 355,000 standard cases to 1.175 million standard cases, that of soda ash increased from 427,000 tons to 514,000 tons, that of woolen goods increased from 7.7 million meters to 13.9 million meters, that of vehicles increased from more than 5,000 to more than 20,000, that of chemical fibers increased from 427,000 tons to 514,000 tons, that of bicycles increased from 2.93 million to 5.63 million, that of sewing machines increased from 420,000 to 1 million, that of wrist watches increased from 2 million to 4.32 million, that of television sets increased from 153,000 to 902,000, that of cassette recorders increased from 42,000 to 288,000, and that of cameras increased from 12,000 to 120,000. Tianjin ranked higher than in the value of industrial output of some products.

During the "Sixth 5-Year" Plan period, we strengthened our readjustment work, and the production setups and product structure became more rational. While developing the primary and secondary industries, we adopted supportive and preferential policies to boost the development of the tertiary industry; persisted in encouraging the state, the collective, and the individual units to participate in the work; and witnessed a vigorous development in the commercial, banking, information, consultation, and service departments. The proportion of tertiary industry in the gross national product rose from 23.7 percent in 1980 to 27.2 percent in 1985. In the industrial sector, we vigorously developed the production of consumer goods for daily use; shut down and suspended the operation of some heavy industrial enterprises that lacked prospects for development, amalgamated them with other enterprises, and switched them to the manufacture of other products; worked out overall plans for the development of 18 consumer products such as bicycles, household electrical appliances, chemicals for daily use, and foodstuffs, as well as 5 other supportive trades; and created a number of quality brand-name products. Meanwhile, we also readjusted the service orientation of heavy industry, vigorously provided technology and equipment for the light and textile industries and other trades, strengthened the production of basic raw materials, and basically stabilized the ratio of light industry to that of heavy industry at 55 percent to 45 percent. In the agricultural sector, we based our work on "serving the city and making the peasants rich"; persisted in comprehensively developing agriculture, forestry, animal husbandry, sideline occupations, and fisheries, and operating the agricultural, industrial, commercial, transport, and building industries in an all-round manner; and greatly raised the commodity rate. In the total agricultural output value, the proportion of forestry, animal husbandry, sideline occupations, and fisheries (including the village-run industries) rose from 64.6 percent in 1980 to 79.2 percent in 1985. The output value of town-run and township enterprises reached 4.45 billion yuan, accounting for 68.5 percent of the total product of the rural society, and became an important force for vitalizing the rural economy.

During the "Sixth 5-Year" Plan period, we firmly grasped the technological transformation of the existing enterprises, and remarkably strengthened the economic forces. The municipality as a whole invested 6 billion yuan in the technological transformation of the industrial departments, which accounted for 60 percent of the total industrial investment in fixed assets, completed 68 key capital construction and technical projects, upgraded the quality of 26 key products, and developed some competitive products and products in short supply, as well as some export products. Through technological transformation, we expanded the production capacity of steel by 460,000 tons, pig iron by 250,000 tons, crude oil by 1.75 million tons, limestone for making cement by 900,000 tons, aluminum products by 8,600 tons, sodium carbonate by 120,000 tons, polyester flax by 80,000 tons, black and white kinescopes by 1.44 million, high- and medium-grade cigarettes by 350,000 boxes, and woolen spindles by 42,000. Through transformation, we increased economic results. According to an initial estimate, after putting all the 26 key products into production, we will increase the output value by 5.7 billion yuan and taxes and profits by 1.5 billion yuan, and create some $380 million in foreign exchange. Judging from the projects which had passed the acceptance tests, the ratio of input to output was 1 to 3 and the ratio of input to profits and taxes was 1 to 0.6. Through technological transformation, we raised our technical level. Since 1983, by using the foreign exchange we are entitled to use, we have imported foreign advanced equipment, carried out scientific research projects, transformed more than 100 production lines, upgraded and updated some outdated products, developed some new products, and made it possible for the quality of some 10,000 products, including engineering machinery products, motor vehicles, electric pumps for oil extraction [qian you dian beng 3383 3111 7193 3119], chain-type oil extractors, a laser microscopic system [ji guang chao suo wei xi tong 3423 0342 6389 4799 1792 4762 4827], and radios and television sets, to attain the domestic pioneering standards or the international advanced level. Through transformation, we strengthened the building of some basic links, and raised the levels of some basic technologies, raw materials, and component parts, which played a good role in improving the functions and quality of products and accelerating the pace of domesticizing the imported products.

During the "Sixth 5-Year" Plan period, we carried out the economic structural reform in a persistent and steady manner, thus increasing vitality and vigor in the various sectors of the national economy. In the rural areas, a decisive success was won in the first stage of reform focusing on the institution of the household output-related contract responsibility system, and we entered the second stage focusing on stimulating the development of commodity production. Through the abolishment of the systems of monopolized and fixed-quota purchases, the readjustment of the rural production setup, and the clearance of the circulation channels between the urban and the rural areas, the rural economy was reoriented toward specialized, commodity, and modern production. Commodity rate of farm and sideline products reached 77 percent, 10 percent higher than in 1980. In the urban areas, the reform focusing on invigorating enterprises is being carried out in an all-round manner. Industrial enterprises have been allocated with greater decisionmaking power to allow them to enjoy more rights and interests in planning, pricing, supply and marketing, and personnel management. The second step of tax reform changing profit delivery into tax payment was completed at large and medium-sized enterprises, and some small state enterprises were turned into ones "owned by the state, and operated by the collective, which should pay taxes according to regulations, and be responsible for their own profits and losses," thus sparking the enthusiasm for production and operation. Various forms of economic responsibility systems were extensively enforced within enterprises, which began to break with the egalitarian way of distribution, and aroused the labor initiative of the masses of staff members and workers. Construction departments introduced the bidding system and the system of signing contracts to fix the amount of wages for every 100 yuan worth of finished work to spur enterprises to strengthen their operation and management. In general, the construction period was cut by 30 percent and construction costs by 5 to 10 percent. Transportation departments changed their monopolized operation, and transportation undertakings run by collectives and individuals were developed to make up for the shortage of means of transportation. After the reform of the management system, Tianjin Harbor expanded its power and enhanced its vigor, thus greatly improving its loading and unloading efficiency, and alleviating the delay in loading. Sales departments eliminated the system of establishing wholesale units according to administrative levels; set up a group of trade centers, trade warehouses, and wholesale markets; and experimented with the system of combining industry and commerce into one in the textile, medical, and silk production trades, thus reducing the intermediate links, increasing the circulation channels, and promoting commodity exchanges. In the reforms of the price and wage systems, we followed the arrangements of the central authorities, and took an important step forward. After last May, when the plan for the price reform was promulgated, vegetables, meat, fish, poultry, and eggs were abundant, their supplies were normal, and their prices were basically stable. The first phase of the wage reform of government organs and institutions, and the coordinated wage reform of enterprises had been, by and large, completed by the end of 1985, and the wages of the masses of staff members, workers, and cadres were raised by varying degrees. In the field of lateral economic cooperation, we adhered to the principle of equality, mutual benefit, mutual supply of what is needed, learning from others' strong points to offset our weaknesses, and common development; established economic cooperative relations with more than 300 enterprises of 28 provinces, municipalities, and autonomous regions; discussed and reached agreements with 28 provinces, municipalities, and autonomous regions on more than 4,500 scientific and technological cooperation projects; and established ties with some colleges and universities of 17 provinces and municipalities in order to mutually train students. Through cooperation, our municipality's acute shortage of energy resources and raw materials was alleviated, the supply of goods for exports increased, and exchanges in science and technology and personnel were expanded. In addition, marked results were also achieved in the reform of the systems of districts and neighborhoods, and districts and neighborhoods played an important role in building and managing the city and arranging the daily lives of the people.

During the "Sixth 5-Year" Plan period, we conscientiously implemented the principle of opening to the outside world, and opened up a new situation in foreign economic and technological exchanges. Foreign exchange earned from exports showed a substantial increase. Under the circumstances in which more ports were opened throughout the country and goods shipped in from other areas declined by a large margin, the accumulated volume of exports of Tianjin Harbor reached $6.78 billion, registering a 35.6-percent increase over the "Fifth 5-Year" Plan period. Great changes also took place in export product mix, with the proportion of industrial goods being increased gradually, and some machinery and electrical products beginning to enter the international market. At the same time, nontrade foreign exchange earnings, such as earnings from tourism, also increased every year. Encouraging results were achieved in the imports of advanced foreign technologies. By the end of 1985, we had signed contracts with foreign countries for 574 projects, involving $530 million. Of these projects, 288 were completed and went into operation, and can create 3.3 billion yuan in output value and $150 million in foreign exchange through exports every year. More than 80 percent of these projects reached the foreign technological levels of the late 1970's and early 1980's. Fairly rapid progress was made establishing Chinese-foreign joint ventures. By the end of March 1986, we had signed contracts with 13 countries and regions, including Japan, the United States, Britain, France, and Hong Kong, for 153 joint venture projects involving a total investment of some $460 million, of which 47 percent was foreign capital. Fifty-eight joint ventures have opened business, and most of them achieved very good economic results and a balance in foreign exchange with some surplus. After more than 1 year of construction, the infrastructure in the first area to be developed in the economic and technological development zone took initial shape, and was provided with the conditions for accepting foreign funds. By the end of last year, contracts for 20 joint venture, cooperative, and import projects had been officially signed, with the total investment reaching $470 million. In addition, we established six joint ventures for production and management in Pakistan, North Yemen, Venezuela, Canada, and the United States, undertook a group of foreign engineering projects, and developed labor service cooperation.

During the "Sixth 5-Year" Plan period, we persistently considered the development of science and education a strategic focus, and thus achieved marked results in technological progress and intellectual development. We sparked the enthusiasm of the masses of intellectuals by conscientiously implementing the policy on intellectuals and the guidelines of the decisions on reforms of science and technology and educational guidelines issued by the central authorities. Education funds increased. In the 5-year period, spending on education reached 970 million yuan, 75.88 percent more than in the "Fifth 5-Year" Plan period. Carrying out the principle of serving economic construction, scientific research departments organized various forms of associations engaged in both scientific research and production, exerted concerted efforts to tackle major technical difficulties, developed scientific and technological markets, and carried out paid transfer of scientific research findings. More than 60 percent of the scientific research findings have been applied, thus promoting industrial and agricultural production and various undertakings. During these 5 years, 1,928 major scientific and technological achievements were scored in industry, agriculture, new technologies, and basic research. Of these achievements, 31 won the national invention award and 5 won the international invention award or gold and silver medals at exhibitions of new technologies. Among the 105 scientific and technological achievements China placed on display to be transferred at Japan's international exposition, 27 came from Tianjin. Social science workers actively carried out their research work in close coordination with the building of the two civilizations, and scored some achievements. Adhering to the principle of gearing education to the needs of modernization, the world, and the future, education departments actively implemented the education reform, strived to improve the educational quality, and developed schools of various categories at various levels. Primary school enrollment rate of school-age children reached 99.26 percent. Secondary vocational and technical education developed rapidly, and the number of students studying at secondary vocational and technical schools amounted to 45 percent of the total number of students of the schools equivalent to senior middle schools. Higher education was gradually improved. Commercial, agricultural, and science and engineering institutions were established, and some urgently needed specialities were set up. During the 5 years, the students studying at full-time schools increased by 50 percent, and the number of postgraduates increased by 410 percent. Adult education was carried out extensively. During the "Sixth 5-Year" Plan period, basically all young staff members and workers attended classes aimed at improving their general and technical knowledge, and more than 40,000 people were studying at higher educational television, spare-time, radio, and correspondence schools, showing a 290-percent increase over 1980. As a result of several years of advocation, urban and rural areas throughout the municipality launched activities to support education, the common practice of respecting teachers and stressing education was initially established, the status of teachers was greatly raised, and the conditions for running schools improved noticeably. In addition, new achievements were also scored in culture, public health, sports, press, publication, radio and television broadcast, and family planning.

Thanks to the strengthening of urban construction and management, the functions of urban areas have been improved by a big margin during the "Sixth 5-Year" Plan period. The completion of the project for diverting the Luan He water to Tianjin with an annual water supply capacity of 1 billion cubic meters has provided Tianjin with a reliable water source as well as a complete water diversion system. Thus, the problems of lacking water for production use and the people having salt water were eliminated. The newly added daily water supply capacity reached 230,000 tons with the completion of the newly built and expanded water works. Conditions for water supply have been improved and more and more places with high-pressure hydraulic power have been provided with water. Thanks to building and renovating drainage pipelines and pumping stations and excavating sewage disposal conduits, the drainage capacity increased. With regard to environmental protection, the three giant dragons that were sending out "yellow, white, and black" smoke have been handled. The Jizhuangzi sewage treatment plant was completed, 63 factories and workshops with serious pollution were moved to other places or were transformed, 217 units that created noise disturbing the people were brought under control, and the smoke and dust from more than 1,700 boilers and kilns were eliminated. Thus, our environmental sanitation has been improved. With regard to transportation and communications, the western section of the central ring road and the Jintangshugang road have been built, some main roads in urban areas have been expanded; a number of brigades have been repaired and built, subways have been opened to traffic, and the Ligang railway line has been expanded. Thus, the transportation situation has been improved. The loading capacity of Tianjin Harbor increased by a big margin thanks to the completion of six 10,000-class berths and the first container wharf in our country, and the renovation of some loading and unloading machines. Conditions have been created for opening the lower reaches of the Hai He to traffic, building factories in the areas along both sides of the river, and having the railways cross the river through building two sluice gates and the Haihe Bridge. Simultaneously, postal and telecommunications facilities have been improved thanks to 45,000 newly added telephone switchboards and the newly built long-distance telecommunications pivots. With regard to renovating the appearance of the municipality, the shacks built for temporary use and a large number of building that were not built in line with the regulations have been dismantled, hundreds of streets and roads and some buildings of artistic style have been renovated, and some ancient buildings in Jixian County, including the Great Wall and some cultural streets, have been repaired. Simultaneously, we also firmly attended to afforestation. The appearance of the municipality has been beautified through the building and repairing of some parks, grasslands, and small public courtyards with flowers and trees. All this has helped improve the conditions for production and livelihood and create favorable conditions for further opening to the outside world.

Thanks to continuing to do real deeds for the people with all our hearts, the people's livelihood has notably been improved during the "Sixth 5-Year" Plan period. Comparing 1980 with 1985, the per capita income of the urban people increased by 65 percent. Adjusted for prive hikes, the average annual increase of the per capita income of the urban people was 7 percent. The per capita net income of the peasants was doubled and the average annual increase of their income was 15.2 percent. The savings deposits of the urban and rural people increased by 270 percent. Besides, a large number of jobless people have been employed through different channels. The situation of having many people waiting for jobs was basically eliminated. In terms of the market supply situation, the total volume of retail sales of commodities increased by 83.9 percent over the past 5 years, showing an average annual increase of 13 percent. Great changes have taken place in the people's consumption structure. At present, the people are particular about food nourishment, beautiful clothing, and expensive consumer goods. The number of expensive durable consumer goods owned by households, such as television sets, cassette recorders, and refrigerators, increased by a big margin. During the "Sixth 5-Year" Plan period, houses occupying more than 17 million square meters of floor space were built in the urban areas, 2 million square meters of floor space more than the total figure of the 32 years before this period. The strain on housing was alleviated thanks to rebuilding houses that leaked and some dangerous and shabby houses. The people's housing conditions have been improved. The per capita housing areas of the rural people increased from 10 square meters of floor space to 14.5 square meters. In terms of the construction of service facilities, food streets, commercial streets, and a large number of commercial networks have been built, farm products trade markets have been set up, public transportation service lines have been expanded, more than 6,000 sickbeds and 140,000 family sickbeds have been added, and a large number of public toilets have been set up. Thus, the people's difficulties in "purchasing goods," "taking a car," "being hospitalized," and "finding a toilet" have been alleviated to varying degrees. The changes and improvements in the people's livelihood in this period have rarely been seen since the founding of the PRC.

During the "Sixth 5-Year" Plan period, we persisted in grasping the two civilizations simultaneously and unceasingly strengthening the building of the spiritual civilization. In the past few years, the municipality as a whole persisted in upholding the four basic principles and conducting education on ideals, morality, culture and the sense of discipline, and extensively launched the activities on "five stresses, four beauties, and three loves," and on implementing the "rules for citizens." In line with their own characteristics, all fronts also launched activities on vying to be the civilized units, villages and towns, and five-goods families as well as the army-people joint activities to build the spiritual civilization. The ideological and political awareness as well as the morality of the people continued to be enhanced, and the spirit of self-respect, self-esteem, and a sense of pride were gradually formed among the people throughout the municipality. The literary and art circles strived to adhere to the orientation of serving socialism and the people, and created a number of fairly good spiritual products. Meanwhile, we carried out struggles to deal severe blows to serious criminal activities and economic crimes, destroyed some vile and very harmful criminal cliques, seriously and promptly punished some criminals in accordance with law, strengthened the consolidation of social order and the comprehensive tackling of public security problems, and redeemed a number of misguided youths. At present, social order has improved remarkably, and the people have a sense of safety. Tianjin became one of the areas in China with fairly good public security.

During the "Sixth 5-Year" Plan period, we fulfilled the reconstruction task after the earthquake, and formulated an overall plan for urban development. The serious earthquake in 1976 brought great damages to our municipality, directly incurring some 3.9 billion yuan of economic losses. At that time, some 60 million square meters of houses were destroyed, of which some 16.8 million square meters of houses were residential houses, accounting for 70 percent of the municipality's total residential housing areas. Under the cordial concern of the CPC Central Committee, and the vigorous support of the fraternal provinces, cities, prefectures, and the PLA, the people throughout the municipality displayed the indomitable spirit that man can conquer nature, and launched an extremely hard and bitter struggle in an effort to restore production and to rebuild their homes. In the past 10 years, we repaired and reinforced some 800,000 houses with a total area of more than 14.4 million square meters, newly constructed some 22 million square meters of residential housing, and repaired and rebuilt a great number of houses belonging to the enterprises and establishments, roads, bridges, pipes, telecommunications lines, and some urban public facilities, which were damaged in the earthquake. The once desolate scene of broken walls and devastation after the earthquake is now putting on an entirely new outlook. In the course of rebuilding houses after the earthquake, the central authorities allocated special funds of some 4.7 billion yuan for this purpose. Together with the funds raised by the local governments, the total investment in this field reached some 5.79 billion yuan. At present, such a task has been successfully completed and Tianjin municipality's urban construction has begun to embark on a normal path. Last year, based on the original work, we organized the forces from all quarters to formulate the municipality's overall plan which was discussed and adopted at the 3d session of the 10th Municipal People's Congress. This overall plan defines Tianjin's nature, scope, and layout, and portrays a magnificent blueprint for building Tianjin into a new place with socialist modernization. Meanwhile, Tianjin's economic construction and urban construction are being gradually carried out in line with this overall plan.

Fellow deputies, the achievements and changes during the "Sixth 5-Year" Plan period were victories that came from our efforts to proceed with the work from Tianjin's actual situations and our conscientious implementation of the central line, principles, and policies as well as the results of the broad masses of people's hard struggle and their spirit of being the masters of the state. While fully affirming the achievements, we should also sobermindedly note that there are still some mistakes and defects in our work. There are still many problems in handling the relations between controlling the macroeconomy and enlivening the microeconomy. The production setups and the product structure are still far from being rational and the quality of some enterprises is still low. Their product quality is low and their economic results are not ideal. The urban infrastructure is fairly backward and the urban management work lags behind other places and is far from meeting the needs of economic development. We are comparatively weak in carrying out ideological and political work and the unhealthy trends are still far from being checked with vigorous efforts. All these should merit our full attention. The achievements and experiences gained during the "Sixth 5-Year" Plan period are the favorable conditions for implementing the "Seventh 5-Year" Plan, and the mistakes and defects during that period are the problems which we should vigorously solve during the "Seventh 5-Year" Plan period. We should conscientiously, realistically sum up the work experiences gained in the "Sixth 5-Year" Plan period, and persist in accurately correcting mistakes in an effort to better carry out the tasks for the "Seventh 5-Year" Plan period and to score greater achievements.

An Explanation on the "Seventh 5-Year" Plan

The formulation of the draft "Seventh 5-Year" Plan of Tianjin Municipality began in late 1982 in line with the unified arrangements of the State Council. In the course of the formulation, we gave heed to the opinions of relevant departments and experts of various fields extensively, carried out repeated economic and technological appraisals, and comparisons of many plans, and, on this basis, drew up the preliminary draft of the "Seventh 5-Year" Plan. Later, in line with the CPC Central Committee's proposal for the "Seventh 5-Year" Plan, and the guidelines of the Fourth Session of the Sixth NPC, we revised it once again, and worked out Tianjin Municipality's draft "Seventh 5-Year" Plan to be submitted to this session for examination and discussion.

The "Seventh 5-Year" Plan period is a very important historical period. According to the strategic objective set forth at the 12th National Party Congress, our municipality should quadruple its industrial and agricultural output value by the end of this century on the premise that economic results are improved continuously, and, according to the requirement of the overall plan for Tianjin Municipality, should gradually become a comprehensive industrial base with advanced technologies, an open, multifunctional economic center, and a modern international port city. The fulfillment of this grand strategic goal is decided, to a very large extent, by the work of the "Seventh 5-Year" Plan period. These 5 years should be a period for greatly readjusting production structure and product mix, for strengthening key construction projects and technical transformation, and for laying a solid material foundation for the future economic revitalization. They should also be a period for actively developing science and education, for accelerating the development of intellectual resources, and for accumulating forces in the field of personnel for the future technological progress. More importantly, they should be a period for carrying out in-depth economic structural reform, expediting a change of old system into new ones, and basically bringing into balance the relations between the various sectors of the economy. In addition, they should be a period for greatly reinforcing the urban infrastructure, improving the comprehensive functions of the city, and building the frames for the fulfillment of the urban overall plan.

Such a specific historical position of the "Seventh 5-Year" Plan period requires us to follow the following guiding principles when formulating and implementing the "Seventh 5-Year" Plan: It is necessary to place reform above everything else, and properly handle the relationship between reform and construction so that they can coordinate and promote each other. It is necessary to properly handle the relationship between growth rate and economic results while focusing on improving economic results, and guarantee a sustained, stable, and coordinated development in our municipality's economy. It is necessary to persistently rely on science and technology when carrying out economic construction, gear science and technology to the needs of economic construction, combine science and technology with economic construction closely, and promote economic and social development through scientific and technological progress. It is necessary to greatly strengthen the building of the socialist spiritual civilization while promoting the material civilization, and make sure that the four modernizations proceed along the socialist orientation. It is necessary to pay close attention to showing concern for and improving the people's living standards on the basis of developed production, and enable production and construction to progress in a coordinated manner together with the improvement of the people's living standards.

In line with the arrangements of the state's "Seventh 5-Year" Plan, and the actual conditions of our municipality, our major tasks and fighting goals during the "Seventh 5-Year" Plan period will be as follows:

We should maintain a definite economic growth rate, and double the industrial and agricultural output value, the GNP, and the national income by 1990. The draft "Seventh 5-Year" Plan stipulates that in 5 years the industrial and agricultural output value should increase by 34 percent, averaging an annual increase of 6 percent; the GNP should grow by 40 percent, averaging an annual increase of 7 percent; and the national income should increase by 34 percent, averaging an annual increase of 6 percent. By 1990, the industrial and agricultural output value should reach 43.8 billion yuan, 110 percent more than in 1980; the GNP should reach 23.65 billion yuan, 130 percent more than in 1980; and the national income should reach 18.6 billion yuan, 100 percent more than in 1980. The accumulated revenue during the 5 years should be 27.8 billion yuan, an increase of 30 percent over the "Sixth 5-Year" Plan period in terms of comparable standards. The volume of exports through the port will continue to grow. Of this, the volume of export goods supplied by our municipality will reach $4.8 billion, representing a 30-percent increase over the "Sixth 5-Year" Plan period.

We should develop the production of highly competitive products, and establish 10 key trades. By late this period, the number of the products which can produce more than 100 million yuan of output value annually will increase from the present 41 to 64, that of the products which can produce more than 50 million yuan of profits and taxes annually will increase from the present 27 to 44, that of the products which can create more than $5 million of foreign exchange a year will increase from the present 25 to 50, the proportion of the technology intensive trades will grow from the present 18.8 percent to 23.1 percent, and the proportion of the new industries will go up to 1.7 percent from the present 0.7 percent. We should achieve a great development in the complete sets of equipment composed of machinery and electrical instruments, and serialized products. We should be ranked among the best of the country in the output and quality of minivans, tractors, forklifts, elevators, soda ash, caustic soda, dyestuff, metal products, duplicators, color televisions, cameras, bicycles, wrist watches, woolen piece goods, and sports goods. We should initially establish 10 key trades--the auto industry, equipment and machinery for energy and other industries, electronic industry, basic and refined chemical industries, quality rolled steel and metal products, new building materials, household electric appliances, machinery for daily use, garment and woven articles for decoration use, and food industry.

We should actively develop the coastal areas, and gradually move key industries to the eastern part of the municipality. According to the urban overall plan, during the "Seventh 5-Year" Plan period, we will establish a new metallurgical industrial area in the northern bank of the lower reaches of Hai He by building large enterprises, such as a seamless steel tubing mill, and a copper smelting plant; and gradually turn the southern bank of the lower reaches of Hai He into export-oriented industrial base by expanding the Zhenhua Woolen Mill, the Liulin Woolen Mill, and the branch of the No. 3 Cotton Mill. In Tanggu and Hangu districts, we should complete the reconstruction and expansion of such large enterprises as the Tianjin Soda Plant, the Dagang Chemical Works, and the Tianjin Chemical Works, expand the crude salt production capacity of the Tanggu and the Hangu Salt Plants, and give play to the advantage of the marine chemical industrial area. In the Dagang District, we should continue to increase the crude oil production capacity, perfect the intensive processing of oil refineries, complete the long-staple chemical fiber project, renovate the natural gas separating equipment, and set up a basic frame for the petrochemical area. In the economic development zone, the construction of the 3-square-km industrial area, and the 1.2-square-km living compound should be completed, and a group of China-foreign joint ventures, cooperative enterprises, and enterprises run exclusively with foreign investment should be established. By 1990, the industrial production capacity of the entire coastal area should reach 10 billion yuan, doubling that of 1985.

We should greatly improve the functions of the city, and make the electricity supply, and transport facilities "basically compatible with the functions." During the "Seventh 5-Year" Plan period, we should continue to greatly strengthen the construction of urban infrastructure in line with the overall plan. We should study the comprehensive development and utilization of the water resources of our municipality, and achieve a balance in the supply and demand of the water resources. The Xinkaihe and the Lingzhuang water works should be expanded to make their daily water supply capacity reach 1 million tons. We should renovate the water drainage facilities of the five large areas where such facilities are poor, prepare and establish the Dongjiao sewage treatment plant with a daily capacity of 400,000 tons, improve the auxiliary environmental sanitation facilities, accelerate the treatment of waste gas, waste water, and industrial residues, and improve the quality of environments. We should reconstruct and expand the No. 1 thermal powerplant, and the Junliangcheng, Dagang, and Yangliuqing powerplants, and newly build the Jixian county powerplant, and the Chentangzhuang thermal powerplant. The total construction scale will be 3.22 million kilowatts, the newly added power generating capacity will be 1.07 million kilowatts, and by 1990 the installed capacity of the whole municipality will reach 2.37 million kilowatts. We should build the inner, central, and outer ring roads, and some dozen main roads spreading from the ring roads, expand a group of sections where traffic jams often occur, newly build and rebuild a number of bridges, continue the construction of the subways, and establish an urban road network in its initial shape. We should renovate the Tianjin bus terminal, do a good job in the auxiliary projects for the railway hub, and extend the local railways. We should complete the construction of the Tianjin section of the Beijing-Tianjin-Tanggu expressway, and renovate 5 state-level roads, and 22 municipality- and county-level roads. We should renovate the Zhangguizhuang airport for civilian use, and open new scheduled flights. We should expand the Xingang port in Tanggu, develop the lower reaches of Hai He, and build a number of berths to increase the port cargo handling capacity by 55 percent. By 1990, we should basically build a comprehensive communications and transportation network with coordinated roads, railways, waterways, and air routes.

We should vitalize the scientific and technological educational undertakings and achieve "increases in the four aspects." During the "Seventh 5-Year" Plan period, the local authorities should allocate 1.7 billion yuan of funds for developing educational undertakings, showing an increase of 79 percent over the "Sixth 5-Year" Plan period, and greatly exceeding the growth rate of financial revenue. We should establish a science village, initially form a new system which closely combines scientific research with production, and complete 800 key joint research projects, showing an increase of 53 percent over the "Sixth 5-Year" Plan period. We should also gradually popularize the 9-year compulsory educational system. By 1990, the suburban counties should make junior middle school education universal and the urban areas should make the senior middle school education universal and the student body of higher educational institutions, secondary vocational schools, skilled workers schools, and vocational schools should reach 189,000, an increase of 66 percent over 1985. In the coming 5 years, we should train 200,000 students of secondary vocational schools of various branches of learning, an increase of 70 percent over the "Sixth 5-Year" Plan period.

We should vigorously develop the tertiary industry and gradually form "five centers." During the "Seventh 5-Year" Plan period, we should speed up the development of the tertiary industry which directly serves production and the people's livelihood. By 1990, the proportion of output value of the tertiary industry to that of the GNP should rise from 27.2 percent in 1985 to 31.4 percent. The banking, insurance, and credit businesses should be developed and the banking units should be readjusted and improved. We should increase the capacity of city and long-distance telephones and telecommunications, and apply modern means such as computers to form an economic information network. We should establish fully-equipped large and comprehensive wholesale markets for the means of production, and economic and technical cooperation centers, set up three wholesale commercial areas in Dongjiao, Xijiao, and Beijiao Districts, newly build a number of high- and medium-grade guesthouses, establish and improve commercial streets, food streets, and hotel streets with their own characteristics in accordance with the functions and needs of the urban divisions, open up tourist areas in Jixian County and Tanggu District, and actively create various conditions for attracting domestic and foreign traders. Meanwhile, we should also strengthen the construction of communications, transportation, scientific and technological, and educational facilities, and lay a good foundation for developing the municipality's "five centers" including communications, trade, banking, information, science, and education.

We should continue to improve the people's livelihood, and achieve "improvements in the eight fields." First, the actual consumption level of the urban and rural residents should show an annual increase of 5 percent in the next 5 years. Second, the urban areas should build 15 million square meters of new residential houses, and the housing conditions should be improved continuously. Third, the gasification projects should be completed so that gas supply for the urban residents will be basically realized. Fourth, a number of thermal power plants should be built, the geothermal energy resources should be tapped and the heating system projects should be completed so that the heating supply rate of the residential housing will reach 40 percent or more.

Fifth, we should increase the production of nonstaple foodstuffs, and guarantee the supply of vegetables, meat, eggs, poultry, and milk. By 1990, the average per-capita supply of aquatic products of the urban residents should reach 16 kg or more. Sixth, we should plant trees and beautify the city, newly build and transform some parks, afforested land, and tourist sports, build a green belt surrounding the urban areas, and raise the urban forest coverage from 9.5 percent to 15 percent. Seventh, we should complete the new construction and expansion projects of five major hospitals, including the No. 1 hospital attached to the Tianjin hospital, and the No. 1 hospital attached to the college of traditional Chinese medicines, improve some specialized hospitals with various characteristics, reinforce the district- and county-level health units, form a three-level health network for disease prevention and treatment, increase the number of hospital beds by 5,000, and improve conditions for health and medicine undertakings. Eighth, we should develop towns in the suburban counties in line with the plan, develop public welfare undertakings in the rural areas, build roads to connect with villages, ensure water supplies to every household, form a network of post and telecommunications, and build supportive service facilities in an effort to remarkably improve the outlook of villages and towns, and make the livelihood of the peasants more convenient.

The objective defined in the "Seventh 5-Year" Plan is grand and the tasks are heavy and arduous, which need the concerted efforts of all the people throughout the municipality to do the following six fields of work well:

1) We Should Firmly Grasp the Readjustment of the Industrial Structure

During the "Seventh 5-Year" Plan period, Tianjin should keep its industrial growth at a certain rate, and lay a good foundation for the second 10 years. The key to achieve this is to form a comparatively rational trade structure and a product structure. To this end, on the one hand, we should conscientiously grasp the construction of newly constructed, and expansion key industrial projects. On the other hand, we should exert efforts to grasp the industrial readjustment work and the construction of industrial basic links.

The guiding ideology for readjusting the industry during the "Seventh 5-Year" Plan period are as follows: We should proceed from developing key trades, fist products and new industries, and take advantage of favorable conditions and avoid weakness in order to make the most of our own advantages. We should carry out an overall strategy to rationalize the structure of the product variety, the technological structure, the energy resources structure, and the marketing structure. We should adopt various measures to develop key technology and capital and labor intensive products and to gradually increase the production of technology intensive products. In line with this guiding ideology, we should take the path of "vacating the birdcage for a new bird" to readjust the industry. That is, we should close, suspend, merge or reorganize the enterprises that score poor economic results, have poor technological level, or fail to find markets for their products, or whose energy and water consumption volume is excessively high; and then use the workshops of these enterprises and concentrate labor forces, funds, energy resources, and materials on developing the products in short supply, the products with higher technological level, export products, new products, and the products that can create greater economic results, find good markets, or have prospects for development. We should extensively put these products into mass production and upgrade their quality. We should link the industrial readjustment with technological transformation and technological import. The enterprises with the capacity to promote the development of the whole trade should be armed with advanced technology. Through eliminating the barriers between different trades, between different departments, between different regions, between the army and the civilians, between the urban and rural areas, and between different sectors of ownership, we should link the production of major products with that of subsidiary products, and combine the manufacture of main engines with that of component parts. We should strengthen the construction of basic technology, basic materials, and basic component parts in order to closely combine the construction of basic industrial links with industrial readjustment. Through readjustment, we should set up a technologically advanced, economically reasonable industrial structure with strong adaptability and other special characteristics; and establish a group of industrial enterprises focusing on producing key products.

We must carry out the industrial readjustment in a planned and organizational manner since it is extremely complicated and painstaking. We should eliminate the thinking of department ownership, foster an idea of taking the whole situation into consideration, work out an overall plan for the industrial readjustment, and carry out the plan by stages and in groups. Strong leading organs should be organized to study ways for solving the problems in the readjustment, and to work out appropriate policies and measures to ensure a rapid and steady progress of the readjustment work.

2) Expand the Economic Exchange With Foreign Countries

Tianjin is one of the coastal open cities in our country. Thus, during the "Seventh 5-Year" Plan period, Tianjin should further implement the policy of opening to the outside world, and strive to expand export and import technology in order to serve the development of the national economy.

Increasing export and the capacity of creating foreign exchange is a prerequisite condition for using more foreign capital and importing more technological items. So we must foster a strategic idea of using foreign capital and imported technology to promote export, making export promote import, linking export with import, and making export volume higher than import volume. We should change the structure of export products in a step-by-step manner; enthusiastically develop expensive durable consumer goods, fine chemical industrial products, high-grade building materials, machines and electronic products as well as develop such export products as traditional light and textile products and farm and sideline products in order to gradually provide the international market with a number of fist products with competitiveness. While reasonably readjusting the export production structure, we should gradually establish and improve the export production system in line with the industrial readjustment by setting up a number of factories and workshops specializing in the production of export products and a number of "trade-industrial-agricultural" export bases. In terms of improving the management of foreign trade, we should adopt various methods and open up various channels to set up and improve marketing, information, and service networks in foreign countries in a step-by-step manner. While consolidating the original export markets in Hong Kong, Japan, and Southeast Asia, we should further open markets in European countries and the United States. We should vigorously develop tourist trade, contract for undertaking foreign projects, and provide more labor service for foreign countries in order to increase the nontrade foreign exchange earnings.

We should vigorously expand the scope of using foreign exchange and do a better job in importing advanced technology, It is necessary to import technology in a planned manner and to prevent blind actions and duplicated imports. We should combine the work of importing technology with that of transforming the technology of the existing enterprises and of organizing scientific and technological forces to "tackle difficult technical problems," and strive to raise the production and technical levels of the existing enterprises within a short period of time. We should pay attention to importing software, competent personnel, key equipment, and modern management knowledge, and do a good job in conscientiously digesting and absorbing the import technology and creating the new in order to speed up the realization of domesticization. We should use foreign funds through various channels and forms and adopt various methods to establish joint ventures and to carry out cooperative production so as to better absorb the latest foreign technology, to transplant the advanced operational and managerial experiences, to unceasingly expand exports and to raise our capability to create foreign exchange.

The economic and technological development areas should adhere to the principle of giving priority to developing industry and technology-intensive industries, creating foreign exchange through exports, and directly using foreign capital, should speed up the construction rate and ensure the quality of projects so that they will soon become windows for importing technology, knowledge, and management experiences and for studying foreign policies.

3) We Should Improve the Infrastructure of the Urban Areas

In order to meet the needs of economic construction, opening to the outside world, and displaying the role of the central cities, during the "Seventh 5-Year" Plan period, we should achieve big progress in developing the infrastructure of the urban areas and greatly enhance the city functions.

We should build the infrastructure of cities in line with the requirements of the urban overall plan. It is necessary to pay attention to the immediate interests as well as long-term interests, work out unified plans, and comprehensively develop all fields. The present construction projects should serve as a foundation for future development and by no means should we create obstacles. Some of the construction projects should serve as the organic components of the overall plan and by no means should they contradict or dislocate with one another. The infrastructure of cities is a complicated system engineering which embraces all fields of work including communications, telecommunications, energy, water supply and drainage, environmental protection, environmental hygiene, services for the people, and people's air defense facilities. We should make overall planning and build a whole range of support facilities. In the future, while building large industrial projects or expansion projects, renovating the outdated areas, opening up new areas, and developing education, science, culture, sports, public health and other undertakings, we should build a number of related public facilities, and raise the comprehensive functions of the carriers [zai ti 6528 7555]--the urban areas.

Along with the unceasing expansion of the scope of urban construction, we should further strengthen the management and maintenance of the infrastructure. It is necessary to adhere to the principle that "the people's cities should be built and managed by the people," fully display the role of the functional departments, districts, and neighborhoods such as the planning, urban administration, gardening, environmental protection, environmental hygiene, housing management, and public security units, mobilize the enthusiasm of all social quarters, and realistically manage the urban areas well. We should guarantee the supply of funds and materials needed for maintaining the urban infrastructure, continue to improve and conscientiously implement all rules and regulations for managing the urban areas, ensure the normal operation of the various city infrastructure, display their functions, and extend their service life.

We should strengthen land management work in line with the overall city planning, rationally use the land, and guard against land abuse and land left idle. Meanwhile, in view of the fact that the rivers are loaded with silt and the embankments are out of repair, we should realistically strengthen the flood prevention work.

4) We Should Speed Up the Development of Science, Technology, and Education

Developing scientific and technological undertakings is an important task mentioned in the "Seventh 5-Year" Plan, as well as an important measure for guaranteeing the realization of the "Seventh 5-Year" Plan. We should foster a strategic viewpoint of paying attention to scientific and technological progress, and realistically rely on scientific and technological progress to develop production, construction, circulation, and various economic undertakings.

During the implementation period of the "Seventh 5-Year" Plan," efforts should be made to vigorously develop and popularize the scientific and technical results with good benefits and rapid effects; to concentrate on spreading the major scientific and technical results of saving energy, water, and raw materials, and of improving the function and quality of products and labor conditions; and to earnestly enforce the "spark plan" in order to apply advanced technology to develop planting and breeding undertakings and to arm the township- and town-run enterprises with technology. We should organize various forces to make concerted efforts to overcome technical difficulties and to deal with the major scientific and technical problems cropping up in developing fist products, conducting reforms among the outdated enterprises, and in expanding exports and technical imports. Efforts should be made to accelerate the pace of developing and studying the latest technology and to strive to make great progress in the application and production of computers and software, optical fiber digit communications, laser, biological engineering, new materials, and automatic technique in order to lay a foundation for establishing some newly developed enterprises.

In order to promote the development of scientific and technological undertakings, efforts should be made to further make a success in conducting reforms in scientific and technical systems, to delegate much power to scientific research units, to encourage or support some units that have conditions to be centers in charge of developing technology, to vigorously open technical markets, to develop an advisory service of science and technology, and to carry out technical transfer with compensations. A good job should be done in opening training classes for the existing personnel in order to upgrade the quality of scientific and technical personnel's ranks and to train number of first-class talented personnel for the key enterprises and the newly rising technology throughout the country. Efforts should be made to enhance the building of scientific research bases, to build some centers in charge of metrological service and radiation research, to reinforce or conduct reforms among a number of institutes, and to upgrade the work standard among the units of patent affairs, information, physics and chemistry analysis, metrological service, radiation research, experiments, meteorology, and environment protection. We should enforce and develop various associations between scientific research and production and put together the forces of various fields, such as the central units stationed in Tianjin Municipality, the local academies and institutes, the higher educational institutions, and the military industrial departments, in order to bring into play their strong points in establishing a close tie between scientific research and production and achieving common development. Efforts should be made to actively expand the scientific and technical exchanges with foreign countries and to enhance the technical coordination with fraternal provinces and regions. We should closely integrate social sciences with the actual situation in the program of building the two civilizations and, by applying the viewpoint of Marxist basic theories, better answer and deal with the major theoretical and practical problems cropping up in the program of building socialist modernizations.

During the implementation period of the "Seventh 5-Year" Plan, it is imperative for us to pay attention to educational undertakings as we did for economic construction in order to strive to build our municipality into one of the advanced cities in education. Efforts should be made to enhance elementary education, to further reinforce the leading forces of middle and primary schools, to newly build or expand a number of middle and primary schools, and to actively develop nurseries and kindergartens. We should continuously readjust the educational structure and further develop secondary vocational and technical education in order to enable the number of students attending middle vocational or technical schools in 1990 to surpass that of students attending general senior middle schools. Efforts should be made to continuously readjust the specialized courses and level structure of the higher educational institutions, to enhance the courses in a short or weak situation, and to support the establishment of newly-rising and frontier courses. We should further restructure, consolidate, and improve various kinds of higher education for adults and encourage the activities of self-study. Efforts should be made to upgrade educational quality; to earnestly implement the principle of achieving all-round development in morality, intelligence, physical fitness, and sense of beauty; and to adequately enhance labor education in line with the specific characteristics in order to train more qualified personnel for the program of building the four modernizations. A good job should be done in enhancing the building of teacher's ranks; training new teachers; holding on-job training classes for the existing teachers, particularly for the teachers of middle and primary schools; carrying out television education under the satellite communications network; organizing teachers of middle and primary schools to study the basic knowledge of philosophy, pedagogy, and psychology; and in continuously improving teaching affairs and educational methods. Efforts should be made to deepen the activities of having the society support education and raise funds to operate schools and to foster fine morale of respecting teachers and attaching importance to education in the society as a whole.

5) Deeply Conduct Systematic Reforms

During the implementation period of the "Seventh 5-Year" Plan, efforts should be made ot push forward the drive to conduct overall reforms with the work emphasis of urban transformation; and to do a good job in conducting reforms in a coordinated manner in the three fields, such as reinforcing the vigor of enterprises, improving marketing systems, and upgrading the government's function in conducting indirect control over economic activities, in order to ensure the smooth realization of the municipal strategy in economic development.

As a large city where industries are concentrated, Tianjin should grasp firmly the central link of invigorating enterprises, which is the key to the establishment of new economic systems, and the stimulation of economic development. Measures should be adopted continuously in and outside enterprises, in particular large and medium-sized ones, in order to enhance their vigor so that the enthusiasm, initiative, and creativity of enterprises and staff and workers can be developed. We should further simplify administration and delegate power to lower levels, separate the duties and responsibilities of governments from those of enterprises, gradually narrow the scope of mandatory plans, grant enterprises greater autonomy in production, supply, marketing, and in personnel, financial, and material management. We should reduce regulatory taxes or allow exemptions from them in a planned manner, raise the depreciation rate, conscientiously lighten the irrational burden on enterprises, and enhance their ability to renovate and develop themselves. We should improve the various forms of the economic responsibility systems continuously, reform the management, personnel, and distribution systems, and give better play to the advantages and potential of enterprises. On the premise that public ownership is persistently taken as the main part, we should continue to develop various forms of ownership and management, and allow some small state-owned enterprises to be run by collectives or individuals through contracts, leasing, and other measures.

Strengthening lateral economic ties among enterprises is an important component of the economic structural reform, and also an inexorable trend of the development of the socialist commodity economy. As a central city, Tianjin should actively create favorable conditions to facilitaate lateral economic ties among enterprises. We should give wide publicity to the important significance of the lateral ties, carry out policies in support of them, formulate regulations to guarantee them, and see to it that within the municipality, and between the municipality and other areas, associations of enterprises are gradually established in different forms and at various levels in the principles of voluntary participation, and mutual sharing of benefits and risks so as to rationalize the enterprise structure.

Striving to develop the socialist commodity market, and gradually perfecting the market system are an important part of the economic structural reform, and have an important bearing on Tianjin's economic development, and the performance of its functions as a central city. We should adhere to the principle of pooling the efforts of the state, the collective, and the individual, give full play to the leading role of state commercial units, and develop various forms of a new multichannel commercial circulation system. We should eliminate the barriers between different departments and regions, welcome other provinces, municipalities, and autonomous regions to open shops or corporations in Tianjin, and encourage the commercial enterprises of our municipality to promote inter-regional cooperation. We should continue to appropriately reduce the varieties and quantity of the materials allocated under plans, and expand the market of the means of production. We should strengthen the unified leadership and management of the people's bank, give full play to the role of various specialized banks in the movement of funds, gradually establish the capital market, and turn Tianjin into an exchange center where thousands of businessmen gather.

A new socialist macroeconomic management system should be established to change mainly direct into mainly indirect control in economic management. The organizational structure of various economic management departments should be readjusted and reformed so that it can meet the needs in strengthening and improving the macroeconomic control. Reforms in planning, pricing, financial, banking, labor, and wage systems should also be carried out in a coordinated manner in order to establish a complete set of mechanisms and means which can combine, in an organic manner, planning with markets, and microeconomic flexibility with macroeconomic control.

We should successfully carry out the second step of the rural reform in an active and steady manner in line with the principle of "serving the city, and making the peasants affluent" while continuously consolidating and improving the household output-related contract responsibility system.

We should further readjust the rural production setup, never slacken grain production, and vigorously develop diverse undertakings in order to achieve a comprehensive development in farming, forestry, animal husbandry, sideline production, and fisheries, and in agriculture, industry, commerce, transportation, and construction. We should foster the strategic idea of developing the urban and the rural areas simultaneously and coordinatedly, actively explore the new ways for linking urban with rural reforms, do a good job in the commodity circulation between the urban and the rural areas, promote cooperative organizations, strengthen the rural service before, during and after production, and stimulate the development of the rural commodity economy. We should continue to uphold the principle of cities supporting the countryside, and industry supporting agriculture, expedite the technical transformation of agriculture, and the intellectual development in the rural areas, increase agricultural input, improve the conditions for agricultural production, and give active support and correct guidance to the development of township enterprises. Through the above-mentioned series of reforms, we should realize the specialized, commodity, and modern production of the agricultural economy of our municipality at an early date, and basically establish a rural economic pattern with urban and rural areas closely linking together.

Reform will be carried out in considerably wide spheres and in a considerably deep manner during the "Seventh 5-Year" Plan period. Generally speaking, the reform in this period will still be in the course of ceaselessly making exploration and accumulating experiences. Therefore, we will certainly come across many complicated problems concerning reform in this period. So, we must always be sober-minded, pay attention to investigations and study, and strengthen organizational leadership. We must persist in the orientation for reform, take reliable steps for reform, take one step and look around before taking another, and ensure that the steps for reform be dovetailed to one after another. We should correctly consider what to discard and what to introduce; define the scale, degree, and steps of direct control in a simplified manner; and strengthen the indirect control over various economic activities. In order to ensure a smooth replacement of the old economic system by the new one, we should adopt necessary administrative measures to supplement the economic and legal measures within a certain period of time. We should prudently treat and properly handle the sensitive problems in reform which are related to the interests of the masses. We should be calm and timely discover and correct the problems cropping up in the course of reform so that the people will have a unified thinking to continue making progress.

6) Strengthen Spiritual Civilization

Vigorously strengthening the socialist spiritual civilization in the course of facilitating the material civilization is an important principle for guiding the socialist modernization. We should study and work out a strategic plan for the socialist spiritual civilization in the "Seventh 5-Year" Plan period. The governments and leading cadres at all levels should persistently implement the principle of "grasping two civilizations simultaneously," and make utmost efforts to cultivate persons of the new generation characterized by socialism and to create a new socialist workstyle.

The most fundamental principle for successfully realizing the grand goals set in the "Seventh 5-Year" Plan and promoting the progress of reform is to rely on the enthusiasm and creativeness of the vast number of cadres and the masses. So, we must conscientiously strengthen ideological and political work in order to arouse the people throughout the municipality with enthusiasm and a revolutionary spirit of making progress and keeping forging ahead. In carrying out ideological and political work, we should strengthen self-reform, adopt proper methods suitable to the requirements of the masses to deeply and constantly carry out the four basic principles and the education of "having lofty ideals, moral integrity, education, and a sense of discipline" in order to make more people become laborers with lofty ideals, moral integrity, education, and a sense of discipline. In accordance with this principle and in line with the actual conditions for carrying out reform and opening to the outside world we should educate and guide the masses to correctly handle the relations between the interests of the individuals and the state, between the interests of the part and the whole, and between immediate interests and long-term interests; and to correctly handle the mistakes and complications possibly cropping up in the course of reform. While vigorously developing commodity production, we should eliminate the idea of putting money above everything else, and persist in the principle of distribution according to work as well as correct the idea of haggling over every ounce and working according to payment. Simultaneously, we should energize the enterprises by expanding their decision-making power, and oppose individualism and selfish departmentalism. In short, we must persist in socialist orientation to achieve the reform work and the work of opening to the outside world and to make the broad masses of the people maintain good spiritual outlook.

Greater progress must be made in sports and the cultural undertakings in the spheres of literature and art, press and publication, and broadcasting and television during the "Seventh 5-Year" Plan period. We must persist in the orientation of serving socialism and the people, correctly handle the relations between social effect and economic results, attach primary importance to social effects, and create more and better spiritual products so as to make contributions to the development of the two civilizations. We must set up a group of cultural facilities in this period, such as libraries, television relaying towers, large gymnasiums, artistic halls, natural museums, and concert halls; rebuild the great theater of the Tianjin Guesthouse and some other theaters; and further improve mass sports facilities in order to ceaselessly enrich the people's cultural lives.

During the "Seventh 5-Year" Plan period, our municipality will face a new birth peak, therefore, we should give first priority to family planning work and persist in grasping it with unremitting efforts. We should promote late marriage and late birth and vigorously promote the practice of giving healthy birth and raising children in a healthy manner. The various relevant departments should exert concerted efforts to resolutely bring the natural population growth rate below 9 per thousand. Meanwhile, we should strictly control the mechanical increase [ji xie zeng zhang 2623 2750 1073 7022] in the urban population.

To realize the "Seventh 5-Year" Plan, we should have a very good social environment. In the process of reform and opening to the outside world, the decadent and moribund feudalistic and capitalist things will seize the opportunities to grow. To this end, we should clarify our understanding, persist in grasping construction on the one hand and grasping the legal system on the other, strictly follow and enforce the law, and punish the law-breakers, and ensure that all the people are equal under the law. We should resolutely deal blows to all serious criminals and economic criminals, ban and check all decadent and evil trends that seriously harm the general mood of society. We should make continued efforts to comprehensively implement all measures for tackling social security problems, conduct education in popularizing legal knowledge, strengthen the sense of the legal system of the cadres and the masses, pay particular attention to strengthening youth education, and effectively prevent and reduce criminal offenses in order to consolidate the achievements in reform and opening to the outside world and to ensure social stability and the smooth progress in economic construction.

Several Suggestions for This Year's Work

This is the first year for implementing the "Seventh 5-Year" Plan and for linking the preceeding tasks with the following ones; therefore, it is a crucial year. This year, we will gradually carry out various tasks and fields of work stipulated in the "Seventh 5-Year" Plan so as to make a good start for the next 5 years, to heighten the people's spirit, and to continuously maintain the enthusiastic and progressive spirit of the people. Only by so doing, can we create a fairly good economic and social environment, ensure the smooth progress in the future reforms, promote a sustained, steady and coordinated development in the national economy, and lay a good and solid foundation for successfully fulfilling the "Seventh 5-Year" Plan.

At present, our municipality's economic and political situations are very good. However, there are still many new and complicated problems lying ahead of us and the prominent ones are the shortages of funds, foreign exchange, and raw materials. In the beginning of this year, the municipal CPC Committee pointed out that there are three possible situations which can appear in this year's economic work: First, the ineffective control of the macroeconomy will create tense situations in all fields and will bring new incoordination in the economic development. Second, equally distributing the limited amount of financial and material resources among all units will make economic construction remain stagnant and sagging. Third, we will try all possible means to overcome difficulties, and reduce all unfavorable factors which may affect the economic construction, take advantage of this opportunity to carry out reforms with strenuous efforts, to grasp management, to lay a good foundation and to keep an upward trend in industrial production and in various fields of work. This year, the focus of our work is to adopt effective measures, to resolutely avoid the first two situations and to ensure the realization of the third situation. The 1986 economic and social development draft plan has been printed and distributed to all deputies. Here, I will give a few suggestions on this year's prominent problems and on the major measures we are going to adopt. Please discuss them.

1) We Should Deeply Carry out Activities on Increasing Production and Reducing Expenditures, and Guarantee the Fulfillment of the Annual Production Plan

This year's industrial production is being carried out under a fairly difficult situation. Thanks to the vigorous efforts of the leaders at all levels and the broad masses of workers, the total industrial output value in the first quarter showed an increase of 2.2 percent over the corresponding period of last year. According to the demand of the annual plan of achieving a 6-percent increase, the tasks for the coming three quarters will still be very arduous. The municipal government is adopting all measures to solve the problems in production in order to ensure the overall fulfillment of the plan.

First, leading persons at various levels should unify their thinking, and enhance their confidence in fulfilling the production tasks. Industry is the main body of our municipality's economy, and industrial production has a bearing on the overall situation. In this year, in particular, when we enforce the fixed-quota revenue system, whether the industrial production is successful or not and whether its economic results are good or not will have a direct bearing on local revenues, on the development of various undertakings, and on the improvement of the people's living standards. For this reason, we should maintain an appropriate growth rate in industrial production with the focus on improving economic results. One-sided pursuit of overheated growth rate is wrong, but economic results cannot possibly be improved without a definite growth rate. At present, some objective difficulties do exist in some plants and enterprises, however, they are inevitable in our exploration of reform. The problem is that we should understand them, adapt ourselves to them, and regard them as an impetus to spur us to improve our work. Judging from the overall situation, our Tianjin's situation is excellent, and the morale of our cadres and people is high. We must never neglect the favorable conditions in various fields just because of the difficulties in certain areas. In the first quarter, faced with similar difficulties and conditions, many trades and enterprises still achieved good results in both production and benefit because they gave play to the role of their subjective initiative. On the contrary, some units failed to promote their production although their conditions were not bad. Therefore, leading cadres at all levels should heighten their spirit, conscientiously shoulder their responsibilities, make sure that all the economic and technical targets are fulfilled in the units provided with sufficient objective conditions, and encourage the units with objective difficulties to press forward in the face of difficulties, and to try their best to promote production and improve economic results. We should increase production at a comparatively quicker pace in the second quarter--a golden season for production--in order to gain the initiative in the production of the whole year.

Second, we should persist in the practice of working on the spot, and conscientiously help grassroots units in solving their practical difficulties. At present, some of the difficulties of grassroots units can be overcome through their own efforts, and others can be solved only with the help of higher levels. Leading persons at all levels, and relevant departments should go down to the grassroots and take the initiative in helping the grassroots eliminate their difficulties and misgivings. They should assist enterprises in solving their problem of a lack of funds, energy resources, and materials. They should do a good job in linking industrial units with commercial or trading units, organize enterprises to increase the production of readily marketable products in short supply in line with market demands, and adopt various flexible measures to promote sales. We should stress the importance of giving prominence to the quality of products, and guide enterprises to improve product quality with great efforts in order to maintain and create more top-quality, brand-name products. We should pay attention to giving play to the functions of imported or innovated technologies, and do a good job in the supplementary work for the 700-odd technical transformation projects which have already been or will soon be completed so that they will reach their designed capacity at an early date.

Third, we should extensively mobilize the masses to launch the activities to increase production and practice frugality. The municipal government and relevant departments are holding forums one after another of managers and plant directors, for workshop chiefs, for engineering, technical, and functional personnel, for work shift supervisors, and for model workers in order to encourage them to suggest measures to counter current problems. All units should publicize among the masses the grand goals of the "Seventh 5-Year" Plan, clearly explain to them the current situation, tasks, favorable conditions, and difficulties, and carry out the activities of "opposing waste, tapping potential, increasing production, and practicing frugality" in a vigorous and conscientious manner. We should organize the masses to suggest ways to rationalize production, carry out technical innovation and cooperation, strive to increase production and reduce energy and raw material consumption, produce more and achieve better economic results through frugality, and create a vivid situation in which the people are trying to catch up with one another, going all out to make progress, and vying for more contributions.

Fourth, we should consolidate and strengthen enterprise management by making a breakthrough in stopping losses of materials and instruments. Although enterprises of our municipality have shown improvement and consolidation their poor product quality and high raw material consumption still constitute a universal problem; in a small number of enterprises, production is still in chaos, discipline lax, waste serious; and losses, theft, and accidents caused by poor production safety occur frequently. At some worksites, in particular, embezzlement has become a common practice, and even carloads of building materials and equipment are carried away. This is an act seriously undermining the socialist construction. The public security departments, in earnestly investigating and dealing with the cases, should strictly punish the robbery elements on the one hand, and find out those who are to blame for the dereliction of duty on the other. As for the enterprises that have been confused in management, repeatedly caused accidents, and have suffered serious losses, efforts should be made to concentrate on consolidating and improving the building of leading bodies, strictly enforcing labor disciplines, and enhancing the work of public security and safety in order to improve the confused situation within the given date. As for the enterprises that have been poor in management and business operation, efforts should be made to establish or improve the regulations and rules, to improve the responsibility systems in the economy, and to upgrade the managerial standard. As for the enterprises that have had a better foundation in management, we should help them to continuously upgrade their standards and gradually achieve modernized management. All the enterprises should pay great attention to production safety, assign full-time personnel to assume the responsibility for safety, and should establish or improve the managerial systems of safety and the regulations and rules on operations in order to plug loopholes and to realistically prevent or curtail the occurrence of various accidents.

2) Vigorously Conduct Industrial Readjustment in Order to Have a Good Start This Year

During the implementation period of the "Seventh 5-Year" Plan, the tasks of conducting industrial readjustment are very heavy. Whether we can make a breakthrough in the tasks this year, gain a set of experience in this regard, and make a good start in the task, has an important significance on fulfilling the readjustment plan as a whole. Over the past few years, we have presented many reasons for carrying out these tasks, and done a great deal of work in industrial readjustment. Generally speaking, we have made progress and scored achievements in the task. However, the step we took and the effect we gained have not been either big enough or ideal. As of now, a large number of enterprises that have spacious workshops, new equipment, plenty of funds, energy resources, and raw materials, have long turned out backward products with poor economic results and dull market sales. Thus, some products that have enjoyed good economic returns and been needed by markets have long been backward in supply because of the restrictive production conditions. There are various reasons why the industrial readjustment is hindered, but the main one is that some comrades still have the idea of turning out a satisfactory variety of products, sticking to old ways, and indulging in departmental selfishness. Therefore, in order to do a good job in conducting industrial readjustment, first of all we should deal with the problems concerning understanding in order to enable everyone in the municipality to fully discern that the work of eliminating backward products through conducting readjustment and of developing fist products is not only an important measure for overcoming the current difficulty to push production forward, but also is the project of vital and lasting importance for carrying out the long-term construction of the municipality and bringing into play the role of industrial base. Thus, only by doing so can everyone in the municipality consciously abide by the readjustment program and actively do a good job in conducting industrial readjustment.

We should make a new breakthrough in industrial readjustment this year. In line with the demands set forth by the "Seventh 5-Year" Plan, efforts should be made to immediately conduct readjustment among the industries, trades, and products that have been determined to be necessary, such as motor vehicles, bicycles, watches, elevators, electric cables, duplicators, refrigerators, and motorcycles, in order to realistically upgrade the quality, quantity, and standards of these products. Our target is to score initial achievements in this regard this year, to score marked achievements next year, and to enjoy the benefit scored in this regard at a later stage of the implementation period of the "Seventh 5-Year" Plan. The municipal People's Government is gradually studying the problems concerning workshops, equipment, funds, and personnel who are needed by the program of developing these products. The departments in charge of comprehensive work and the bureaus concerned must make concerted efforts to vigorously implement the task and to ensure the fulfillment of the task thoroughly.

What we should point out here is that, in the course of industrial readjustment as a whole, it is imperative for us to regard as an important principle the work of making full use of the existing workshops and building fewer projects of indigenous construction style, and to strictly examine or approve the large number of projects of such construction style.

3) Realistically Improve the Measures Enforced in Conducting Reforms in Order To Achieve More Results in the Drive To Conduct Reforms

In 1985 we took a greater step in conducting reforms in economic systems, scored marked achievements, and also experienced some new problems in this regard, such as the inevitable imperfection caused by the exploration program of pioneering the road of advance, the inevitable inadequacy caused by the drive to conduct reforms which has been adopted as readjustment among the production relationships, and the inevitable discord caused by the drive to conduct reforms which has actually been a complicated project for social systems. Therefore, in line with the demands set forth by the State Council, the drive to conduct reforms this year is chiefly to successfully conduct the work of consolidation, digestion, supplement, and improvement, and to make good preparations for taking a greater step in the transformation drive. This is a more complicated and heavy task toward which we are required to adopt a careful attitude, and required to be carried out in a down-to-earth manner.

Supplementing and perfecting reform involves the work in three fields. First, we should further enliven key large and medium-sized enterprises. The Municipal CPC Committee and government have organized forces to conduct investigation especially among large and medium-sized enterprises. Through the investigation, we will understand the situation, sum up experiences, study problems, carry out the work of enlivening these enterprises on a trial basis, and give specifically to help them implement the municipality's 56 regulations concerning expanding decision-making power of the enterprises. Second, we should conscientiously carry out various kinds of economic responsibility systems in line with the improvement of wage reform. In line with the regulations of the State Council, the enterprises should use as funds for reward the portion of money that is retained as production cost after wage reform, and make the most of it. In accordance with the principle of distribution according to work, the enterprises should give awards to industrious and excellent workers and punish lazy workers and those who fail to do their job well, so as to fully mobilize the enthusiasm of the staff members and workers. The organs, institutions and establishments should take charge of solving the prominent problems left over by the wage reform. Third, we should enthusiastically explore new ways for coordinating the urban reform with the rural reform, and for enlivening circulation; further work out policies, and study ways of coordinating the urban reform with the rural reform; such as industrial-commercial, agricultural-commercial, and agricultural-industrial-commercial enterprises; and strive to gradually form a circulation network linking the urban areas with rural ones.

While supplementing and improving reform, we should pay full attention to the ideological work. Along with the profound development of reform and production, visible material interests should be created for the people. However, it is impossible for each measure for reform to certainly bring notable economic results to each and every member of society, and we must not require it either. So, through conducting the ideological work in a painstaking manner, we should educate cadres and the masses to correctly treat reform, to conscientiously grasp both immediate and far-reaching interests, and to make immediate interests subordinate to the far-reaching ones. Simultaneously, we should guide the departments and enterprises to conscientiously foster an idea of taking the whole situation into consideration, to link the interests of the part with those of the whole, and to make the interests of the part subordinate to those of the whole.

4) Strengthen and Improve Macroeconomic Control and Give Flexibility to Microeconomy Under the Situation of Properly Strengthening the Management of Macroeconomy

Thanks to conscientiously implementing the spirit of strengthening macroeconomic control, last year we successfully ensured the demands for production and construction on the premise of not surpassing the state assigned targets for investing in fixed assets, of using credit funds and consumption funds, and of using foreign exchange for import. These achievements were notable and these experiences were valuable. Practices have shown that we must improve macroeconomic control in order to strengthen it. Only when the macroeconomic control is improved can it be strengthened. With so many difficulties in economic construction to solve, this year we must further achieve the work of strengthening and improving macroeconomic control, and make the microeconomy maintain vitality and work around the sound path in which it is properly managed by the macroeconomy.

The key to strengthening and improving macroeconomic management is to strictly control the scale of investment in fixed assets and to rationally readjust the investment structure. In accordance with the demands of the state, we should control the scale of the investment in capital construction to the level of last year. Simultaneously, we should expand the proportion of the investment in production facilities and infrastructure, and reduce the nonproductive investment. Priority should be given to key projects while reducing the construction of general projects. We should arrange funds and materials first for key products. The materials and funds for a project should be defined once and for all. Designing and construction units should practice economy, oppose waste, strengthen management, ensure good construction quality, shorten construction periods, and make efforts to upgrade the returns of the investment.

A prominent issue in strengthening and improving the macroeconomic management is to do a good job in the movement of funds. We should do a good job in the movement of capital among banking departments, and between banking departments and financial departments, organize well the lateral movement of credit funds, and develop direct movement of funds among enterprises in a well-guided manner. Banks and postal departments should actively organize and increase savings deposits. Banking, and foreign trade departments should assist enterprises to make the best use of foreign funds. When issuing loans to serve as circulating funds, we should properly relax restrictions in line with different situations, and give priority to the development of readily marketable commodities, and the commodities to be exported to earn foreign exchange. All enterprises should economize on the use of funds, and fully tap their potential to manage their funds well and use them in a flexible way. In particular, they should accelerate the turnover of circulating funds by reducing stockpiled goods, and reserve materials.

We should continue to monitor funds, institutional purchases, and administrative spendings. and never allow them to exceed the state quotas.

5) We Should Strengthen the Cooperation Between Industrial and Foreign Trade Departments, and Strive to Overfulfill the Task of Earning Foreign Exchange Through Export

This year the state has assigned Tianjin Harbor the task of an export volume of $1.116 billion. Although the first quarter exports showed a 4.2-percent increase over those of the corresponding period of last year, they amounted to only 20.9 percent of the annual quota. Therefore, there are still many difficulties and problems in our endeavor to fulfill the foreign exchange earning task. Both industrial and foreign trade departments, and all quarters concerned should exert concerted efforts, cooperate closely, and step up their work.

The first task is to successfully organize the production of export goods, and strive to increase goods supply. We should try all possible means to provide necessary conditions, such as funds, electricity, and raw materials, to the production of export goods in order to improve its quality, increase its quantity, and guarantee the scheduled realization of the purchasing and marketing contracts. Policies to encourage exports should be implemented in line with the guidelines of the State Council regulations in order for the enterprises, and staff members and workers who can earn more foreign exchange through export to gain benefit, and to gain more initiative in fulfilling their export tasks. We should readjust product mix and carry out technical transformation to greatly develop the traditional products demanded by the international market, and to develop a number of high-grade new products which can yield better returns. We should help industrial departments to understand the international market, provide them with necessary information, and help them in overcoming the difficulties in dealing with foreign countries.

In the meantime, we should do a good job in the purchase and marketing of export goods. This year, goods worth 4.05 billion yuan should be purchased for exports, of which 1.35 billion yuan of goods will come from outside the municipality. We should strengthen lateral economic ties with other provinces, municipalities, and autonomous regions, provide various services, conveniences, and preferential methods for them to expand exports, and strive to obtain more supply of goods for export from other areas. We should exert our utmost efforts to organize exports, and business with foreign countries, strengthen the forecast of and the sales activities at the international market, consolidate the old market, and open up a new one. All the comrades in charge of foreign economic relations and trade should arouse their spirit, continue to improve management, raise their professional competence, and make new contributions to our municipality's foreign economic relations and trade.

In our efforts to expand exports and earn more foreign exchange, we should also pay attention to using foreign exchange in an economical way, and make still better use of our limited foreign exchange by using it where it is urgently needed.

6) We Should Pay Close Attention to Economizing on Electricity, and Successfully Use Our Limited Electricity

An acute shortage of electricity is a conspicuous problem we are facing this year, which restricts the development of production to a great extent, and has a serious impact on the people's lives, and to which great attention should be paid. The fundamental way to alleviate power shortage is to build more powerplants. Therefore, the municipal government has decided to accelerate the expansion of the Junliangcheng Powerplant in order to make it generate power as soon as possible. However, "distant water cannot quench present thirst," and therefore, the most effective way to alleviate the current power shortage is to strengthen management, and make great efforts to use electricity in a planned and economical way. At present, we are seriously short of electric power on the one hand and greatly wasting it on the other. We have great potential for saving electricity. We should mobilize the people throughout the municipality to exert the same efforts to save electricity as they do in saving water. All units and enterprises should use electricity in a planned manner, contract the energy-saving tasks and responsibility to each and every household and person, and change the situation in which there are no quotas for using electricity or for saving electricity. We should give priority to supplying electricity to enterprises that yield good economic results and limiting power that yields poor benefits. Enterprises with their own power plants should implement the reward and punishment system, use the electricity they have generated, commend those units which generate more electricity, and cancel the power supply quotas of those units **that are capable** of generating electricity but refuse to do so. We should practice the system of "imposing a label" on those "electric power departments which have a warlord workstyle" shut down and stop the operation of those that yield very poor economic results, amalgamate them with other enterprises or switch them to manufacturing other products. It is necessary to strengthen management over power supply lines, ensure the power supply quotas but not the power demands of plants, to fix the power supply quotas but not to install new power lines for them. Different prices will be set for those units that use electricity during the "peak and low periods." Higher prices will be set for those units using electricity during the low period. Those units which practice economy in using electricity should be commended and those which use electricity above the plan should be punished. Those which use electricity in a wasteful manner should be restricted in using electricity. Their rights of using electricity will be directly cancelled and their administrative responsibility will be pursued. It is strictly forbidden to use all kinds of operations that greatly consumes electricity. We should strive to ensure power supply for the people's daily needs but they should also economize on power consumption. The power supply and management units should conscientiously implement the relevant stipulations of the municipal government, improve their workstyle, and render better services.

7) We Should Basically Stabilize Commodity Prices, and Do a Better Job in Urban and Rural Market Supply

Last year, after adjusting the prices of nonstaple foodstuffs, market supplies were abundant, commodities were fairly stable and the market situation was good in general. However, market problems involve production, consumption, and other problems are that we are opening the municipality to the outside, vitalizing the economy, and basically stabilizing the commodity prices. The market and price problems have a direct bearing on the people's livelihood and social security, therefore, we should consider them as a major matter and should grasp them firmly and well.

Stabilizing commodity prices is for the benefit of all the people and its success relies on the efforts of all. Each and every department and all comrades should proceed from the overall situation and contribute to stabilizing commodity prices. Although all the people are complaining about the situation of arbitrary price increases, many departments and enterprises are still trying to raise the prices of their products. This is the current prominent contradiction in stabilizing prices. The municipal government has decided that all departments and units should not wantonly raise the prices of products that are carrying state fixed price tags or to raise the prices covertly without the approval of the government. Such a decision should be made a rule. The state commercial units should fully display their dominant role, actively participate in market regulation, and ensure continuous supply and stable prices during both the off and dull seasons. The pricing departments should realistically strengthen supervision and checkups, and strictly punish those that wantonly raise prices. The industrial and commercial administrative departments should strengthen market management and resolutely ban all illegal businesses that may disrupt the market. The public security departments should coordinate with one another, and resolutely punish in accordance with the law those persons who have engaged in profiteering, cheating, and dominating the market and who have acted against the law.

We should ensure urban and rural market supplies. In the beginning of this year, the municipal government adopted a series of measures to arrange for the production of meat, eggs, fish, vegetables, and other nonstaple foodstuffs. It has established lean-meat hogs producing bases, continued to increase the supply of lean meat and to implement the policy of encouraging the raising of chickens, and ensured the supply of poultry and eggs. We should vigorously develop fish production. This year, the average per-capita supply of fresh fish should be 13 kg. We should ensure the vegetable cultivation acreage and the market supply, and purchase vegetables according to contracts signed between peasants and commercial units so that they will jointly guarantee vegetable supplies. The industrial and commercial units should arrange industrial goods for daily use for the market and organize the production and business of small commodities. The production of briquets and heating equipment for winter should be arranged ahead of time and the supply methods should be improved. We should vigorously enliven catering, service, repair, and clothing industries, implement the preferential and supportive policies, increase the number of business units, improve facilities, extend business hours, and improve service attitude so that the situation in which the citizens find it "difficult to buy breakfast, to take a bath, to have their hair cut, to find a tailor, and to make repairs" will be changed remarkably.

8) Persistently Do Solid Things for the People and Continue to Improve the Livelihood of the Masses

Over the past few years, we have scored good results in doing a bunch of solid things for the people's every year. After summing up the experiences gained in the past few years, we know that we should grasp the following few principles with regard to doing solid things for the people. We should do the things that can bring benefits to the majority of the people, the things most urgently demanded by the masses, the things with far-reaching functions, the things that may promote the development of spiritual civilization, and the things we can do. In accordance with these principles, the municipal government has defined 20 solid things for improving the livelihood of both urban and rural people this year. These 20 solid things have been made public and are in progress at present.

The solid things for 1986 have such notable characteristics as follows: First, grasp the improvement of the people's livelihood as well as promote the production development. For instance, this year, we must complete the eastern section of the central ring road to ensure that the central ring road will open to traffic. The completion of the central ring road will not only help shorten the time people spend on their way to and from the working units, but also bring convenience in transportation to the industrial areas along the road. Upon the completion of this road, the transportation funds will be reduced and transportation efficiency will be upgraded. This year, we must complete the civil gasification project. Upon the completion of this project, gas will be supplied to the majority of the households. This not only will give convenience to the people's livelihood, but also may help save energy resources, reduce pollution and upgrade the functions of urban areas. Second, we should solve the most urgent problems in the people's livelihood. In solving these problems, we must pay attention to the work of "making perfect still more perfect" and "providing timely help." For instance, the rural areas should attach primary importance to the work of enthusiastically supporting the poor to help them extricate themselves from poverty. We should mobilize the forces from all fronts throughout the municipality to help the poverty-stricken areas open channels for making money and to help improve the people's livelihood. Simultaneously, the urban areas should attach importance to helping the household problems. All housing construction units should carry out the method of [?] the households in the order of [?] give priority to solving the housing problems for the households with most difficulties. Third, we should pay attention to the construction of cultural and educational, and public health facilities. Of the 20 solid things for 1986, 5 are related to the development of educational, scientific, cultural, and public health undertakings. This year, we should build and expand 3 institutions of higher learning and 20 primary schools; extensively reconstruct 18 primary and middle schoolhouses; prepare to construct educational and scientific research institutions; build a large library; prepare to construct educational, scientific, and cultural commercial streets; and build and expand 4 municipal-level hospitals and 3 district-level hospitals. We should build schoolhouses and teaching laboratories covering 80,000 square meters of floor space in the rural areas, and rebuild the dangerous and shabby schoolhouses covering 80,000 square meters of floor space in remote mountainous areas.

The tasks for fulfilling the 20 solid things for improving the people's livelihood are comparatively heavy. There are many difficulties in it. The municipal government called on all units to strengthen leadership over the work and to make concerted efforts to achieve actual results in these solid things. We must practice economy to do these things industriously and thriftily; set strict demands on the work in order to ensure the quality of the work; conduct the construction work in a civilized way and strive to create no or less disturbance to the people; and constantly stress actual efficiency in order to bring real benefits to the people. The municipal government also called on all units and departments to make arrangements for doing several solid things to solve the people's prominent problems this year in line with the basic principle of doing solid things for the people and in accordance with their actual conditions, then to make these things public, and to conscientiously organize forces to carry them out.

9) The Working Personnel of the Governments Should Play an Exemplary Role in Realizing a Notable Turn for the Better in Social Conduct

The central authorities have required that the large and medium-sized cities throughout the country should realize a notable turn for the better in social conduct this year. Tianjin needs to make great efforts to attain this goal.

Leading organs and leading cadres should take the lead in fostering fine social conduct. All working personnel of the governments should comprehensively implement Comrade Hu Yaobang's call on leading organs for consolidating party style, and should play an exemplary role in upgrading working efficiency, studying hard, strictly enforcing discipline, and strengthening party spirit. Simultaneously, they should persist in doing official work honestly, work selflessly for the public interests, abide by the law and discipline, eliminate bureaucratism and various unhealthy practices, do their job well, render better service to the grassroots units and the people, work hard to promote the development of production and the work in all fields, and to take the lead in realizing a notable turn for the better in social conduct.

Lofty professional morality and professional style and features represent an important manifestation of fine social morale. In conducting education on "four haves," various industries and trades should enhance the education on professional morality in order to enable every staff member and worker to ardently cherish their industry and job. Efforts should be made to earnestly implement the pledge of "several should nots" and "several not allows," which was formulated by every industry and trade early this year, in order to enable some people to correct their malpractices of indulging in back-door deals, establishing a relationship only with leading personnel, and seeking personal gains by taking advantage of their positions. In particular, the commerce, service, public utilities, tourism, medical, public health, and public communications industries and trades, which are closely connected with the masses, should stress professional morality, foster professional standards, and ardently serve the people.

Abiding by public morality and safeguarding public order represent a prominent sign of fine social morale. Generally speaking, the social morale in the municipality has been fine. However, there are still some backward aspects in this regard, such as the frequent occurrence of the phenomena of immorality, savagery, disorder, and being unsanitary. We should continuously and earnestly implement the "citizens' regulations"; and deeply carry out the activities of "fostering new practices, stressing sanitation, and building Tianjin into a civilized city" in order to enable armymen and civilians to mutually build spiritual civilization and to foster fine morality and morale in the society as a whole. We should also enhance the work of consolidating public security in a comprehensive way and do a good job in safeguarding public order, particularly maintaining the public order of public places and downtowns, such as business districts, cultural halls, sports arenas, railway and bus stations, and port areas. We hope that the people throughout the municipality set an example now with concrete deeds in order to truly achieve an obvious turn for the better in social morale this year.

10) Uphold the Principle of Taking Economic Construction as a Main Task and Making Overall Arrangements for Work

Our municipality's tasks in 1986 for building the two civilizations are quite heavy. Therefore, we must make overall plans for the task, take all factors into consideration, and make reasonable arrangements for it. Efforts should be made to not only earnestly fulfill the tasks in order to ensure that the work will not be carried out perfunctorily, but also to uphold the principle of taking economic construction as a center and ensuring the fulfillment of the key tasks. In making arrangements for various work including those for building spiritual civilization, we should make our tasks conform to and serve the party's general line and task in order to prevent the phenomenon of attending to one thing and ignoring another, which can be caused by inadequate arrangements and would influence the leading forces in grasping economic work. Conducting the current work of correcting the malpractices and dealing blows to economic crimes in line with the central arrangements has an important significance in ensuring the progress in the drive to conduct reforms, in the enforcement of the open policy to the outside, and in the program of building the four modernizations. We should earnestly grasp the work and bring about results to the work in a down-to-earth manner. Correcting the malpractices is aimed at better ensuring and promoting economic construction, which requires us to enhance organizational leadership and to successfully deal with the relationship between correction and construction. In correcting the malpractices and dealing blows to economic crimes, efforts should be made to concentrate on grasping major or serious cases and to refrain from letting cases be dealt with perfunctorily and indifferently. As for the cases exposed by the masses, efforts should be made to earnestly investigate and deal with them and to adopt a careful attitude toward the methods of dealing with these cases, such as refraining from spreading the case material at will before obtaining actual evidence and from dealing with the case rashly. Efforts should be made to strictly deal with those who have committed malpractices and violated the law and discipline by taking advantage of conducting reforms and enforcing the open policy. As for the pure flexible and expedient practices cropping up in the drive to pioneer the road of advance and create something new, we should earnestly analyze them and refrain from regarding all of them as malpractices. We should allow, as usual, the process of normal economic activities, such as commodity sales, material purchasing, technical transfer, and exchanging activity with foreign countries. Efforts should be made to earnestly implement the central provisions concerned and to formulate some practical regulations in line with the local actual situation, particularly with the reality created in the drive to conduct reforms and enforce the open policy, in order to enable everyone in the municipality to have rules to follow and the criterion for distinguishing between right and wrong. All in all, while correcting the malpractices, efforts should be made to enable the programs of economic construction, systematic reforms, and open policy enforcement to achieve vital development along a healthy road.

Fellow deputies, the "Seventh 5-Year" Plan has unfurled a promising future full of hope before us and also entrusted us with a higher work demand. During the implementation period of the "Sixth 5-Year" Plan, workers, peasants, intellectuals, the PLA commanders and fighters, public security cadres and policemen, various democratic parties, the mass organizations, and the patriotic personages of various circles, created a new vital situation by following the central guiding orientation, uniting as one, doing pioneering work arduously, breaking through brambles and thorns, pressing forward in the face of difficulties, and displaying their indomitable revolutionary will and high political enthusiasm. During the implementation period of the "Seventh 5-Year" Plan, we should also follow such spirit to create another splendid future and to scale heights in the program of building the two civilizations. Under the party's leadership, let us earnestly study and implement the spirit of the Fourth Session of the Sixth NPC, unite as one, enhance our vigor, carry forward the spirit of the foolish old man removing the mountain, and boldly make progress in fulfilling the grand target of the "Seventh 5-Year" Plan and building Tianjin into a new beautiful socialist modern city with prosperous business and developed civilizations.

JIANGSU GOVERNOR DELIVERS PLAN REPORT

OW152239 Nanjing XINHUA RIBAO in Chinese 2 May 86 pp 1-3

[Report on Jiangsu Province's Seventh 5-Year Plan at the Fourth Session of the Sixth Jiangsu Provincial People's Congress on 22 April 1986 by Governor Gu Xiulian]

[Text] Fellow deputies:

On behalf of the Jiangsu Provincial People's Government, I now make a report on the draft Seventh 5-Year Plan for our province's national economic and social development for your deliberation.

This report is divided into three parts: First, the implementation of the Sixth 5-Year Plan which is the basis for the formulation of the Seventh 5-Year Plan, and then the objectives and tasks during the Seventh 5-Year Plan period, and the main tasks for 1986.

I. The Implementation of the Sixth 5-Year Plan

Under the leadership of the Party Central Committee, the State Council, and the Jiangsu Provincial CPC Committee, the people of the whole province in the past 5 years implemented the principle of adjustment, reform, consolidation, and improvement, and the policy of stimulating the domestic economy and opening to the outside world and, through common efforts, pre- and over-fulfilled the major targets of the Sixth 5-Year Plan. We have achieved still better political stabilization and unity, a gradual improvement in the social atmosphere, and sustained, steady, and harmonious development of the national economy. As in the case of the whole country, our political and economic situation represents one of the best historical periods since the founding of our country.

1. During the Sixth 5-Year Plan, Jiangsu's economy featured a sustained tendency for vigorous development. We achieved better results than we had expected. Profound changes have taken place in the economic and social outlook as a whole.

The national economy maintained sustained growth. The total product of society increased from 70.3 billion yuan in 1980 to 147.5 billion in 1985, increasing an average of 10.5 percent annually, based on constant prices.

The gross industrial and agricultural output value increased from 62.3 billion to 126.9 billion yuan, increasing in average 15.3 percent each year. The gross national product increased from 32.2 billion to 67.2 billion yuan, an average increase of 15.9 percent per year. The national income increased from 27.3 billion to 58 billion yuan, an annual average increase of 15.3 percent. The total product of society, the gross industrial and agricultural output value, the gross national product, and the national income all increased at a rate higher than in other 5-year plan periods. These 4 indexes all doubled in the past 5 years.

The rural economy upsurged as a whole. Our province's total rural society product increased from 27.4 billion yuan in 1980 to 77 billion in 1985, up 280 percent and averaging 23 percent annually. Of this, the output value of industry, the building industry, transportation, and commerce accounted for 62.5 percent of the total product of rural society in 1985, compared with 49 percent in 1980. Some 5.6 million of the rural labor force, or 25 percent of the total labor force in the countryside, shifted from farming to working in town and township enterprises. The commodity marketability rate of agriculture, sideline occupation, and industry increased from 50 percent to over 70 percent. These major changes testify that our rural economy has developed to a new level. The upsurge in the rural economy as a whole in our province was realized under the condition that agriculture was steadily growing. Compared with the Fifth 5-Year Plan, the Sixth 5-Year Plan's average yearly grain output increased from 23.14 million to 29.81 million metric tons; that of cotton from 444,000 to 589,000 metric tons, and that of oil-bearing crops from 321,000 to 819,000 metric tons. Our province has a large population, but limited acreage of cultivated land. Even as the population was yearly increasing, the acreage of cultivated land was yearly decreasing, and the structure of agricultural production began to undergo adjustment, the average per-capita consumption of grain surpassed the 1,000-jin mark in the 2 consecutive years since 1984. The forestry, animal husbandry, sideline occupation, and fishery all developed comparatively fast. The rapid development of town and township industry proved to be decisive to the upsurge of the rural economy as a whole. In 1985, the output value of town and township industry was 38.3 billion yuan, up 350 percent from that of 1980, and accounting for 30 percent of the total industrial and agricultural output value of the whole province; its export commodities earned U.S. $300 million foreign exchange, or 20 percent of the whole province's earnings; it handed in 1.7 billion yuan taxes, 19 percent of the province's revenue; it turned in nearly 700 million yuan profits to the town and township level, supporting the development of agricultural, cultural, educational, and public health undertakings and the construction of small towns; and it paid nearly 4 billion yuan in wages, i.e., an increase of 80 yuan for each peasant.

Development of industrial production has accelerated. The province's total industrial output value increased from 43.1 billion yuan in 1980 to 86.4 billion in 1985 (not including the output value of industrial enterprises at and below village level). The average annual growth rate was 14.9 percent, but the actual growth was at an accelerated rate. During this period, our province persisted in vigorous development of the production of consumer products. As a result, market commodity supply was no longer as short as before. The production of the three old commodities--bicycles, sewing machines and wristwatches--increased by a large margin. The production of the three new commodities increased rapidly. The annual output of household refrigerators rose from 4,570 to 148,700 units, that of household washing machines from 7,740 to 750,000 and that of electric fans from 1.64 million to 4.64 million. In this period, our province improved its energy and raw materials industries and broadened the heavy industry service area. The annual output of coal increased from 18.15 million to 21.94 million metric tons, that of electricity from 16 billion to 23.4 billion kilowatt-hours, that of rolled steel from 1.05 million to 1.45 million metric tons, and that of cement from 6.29 million to 11.17 million metric tons. This period also witnessed the development of newly-emerging industries with greater efforts. More than 1,500 applications for use of computers were developed. Fairly fast development was achieved in the fodder and packaging industries. Some machinery and light industry products began reaching world standards. The products showed some quality improvements. In 1985, 73 of the province's products won either a gold or silver prize from the state. Energy consumption per 10,000 yuan output value dropped year after year. The overall economic result of the industry were also fairly good. For industrial enterprises which are fully independent accounting units, the rate of profit and tax payments delivered to the state for every 100 yuan invested was 29.9 percent. The per capita productivity of the workers of enterprises of ownership by the whole people was 18,840 yuan.

Construction of key projects has been stepped up. In this period, the province as a whole completed a total of 26.8 billion yuan investments in fixed assets. Of these, 59 were large and medium-sized projects built according to the state plan. These include the Yangzi Ethylene Plant, Yizhen Large Chemical Fiber Plant, Lianbi Power Plant in Zhenjiang, Xuzhou Power Plant, Lianyungang Harbor, the Nanjing-Hangzhou Section of the Great Canal, and seven other key projects. This was the period seeing the largest number of large and medium-sized projects commenced in our province by the state. Technical renovation was clearly accelerated. Among the invetments made in fixed assets in the enterprises of the whole people, the ratio of investments in equipment renewal and plant renovations rose from 17.4 percent in 1980 to 34.3 percent in 1985. Capital construction and technical renovations resulted in an increase in the province's production capacity. The 5-year total of actual increases in fixed assets was worth 10.8 billion yuan. The increase mainly included an annual output capacity increase of 856,000 kilowatt in installed power generation capacity, of coal mining of 1.066 million metric tons, of 120,000 metric tons of short polyester fiber, and the completion of nine 10,000-metric ton class berths.

Trade with other parts of the country and foreign countries continued to grow. The retailed total of social commodities in the province increased from 15.4 billion yuan in 1980 to 30.7 billion yuan in 1985, averaging a 14.9 percent growth a year. The market in town and country had brisk transactions. The shortage of some commodities was greatly alleviated. In this period, foreign trade continually expanded. The export total jumped from U.S. $850 million to U.S. $1.56 billion at an average growth rate of 12.9 percent a year. The 5-year total of exports was worth U.S. $6.71 billion, an increase of 1.8 times compared with the Fifth 5-Year Plan. Some export commodities accounted for a fairly larger portion of the nation's total. Rice accounted for one-third, cotton and frozen pork one-fourth each, cotton garments and filature silk one-fifth each, and there were altogether 40 varieties of commodities accounting for one-tenth or more of the nation's total exports. Our province has established trade ties with over 130 countries and regions throughout the world. We also registered a fairly fast increase in nontrade earnings, including foreign construction projects, labor cooperation ventures and tourism.

Social and economic benefits were raised markedly. The province's per capita income increased by 103 percent, from 461 yuan in 1980 to 937 yuan in 1985, while the actual increase of people's income per 100 yuan of accumulation went up by more than two-fold from 20 yuan to 68 yuan. Social labor productivity registered an 81.6 percent increase, from 998 yuan to 1,806 yuan. Financial revenues rose from 6.24 billion yuan to 8.78 billion yuan, an increase of 40.6 percent. Financial revenues of 11 counties exceeded 100 million yuan. Among them, four counties (cities), namely Wuxi, Changshu, Jiangyin, and Wujin, topped 200 million yuan. Displaying the spirit of self-reliance and working hard, 13 counties in the northern Huai He area which had received financial subsidies continuously increased local financial revenues and built up their financial strength by launching economic cooperation with fraternal cities and counties in southern Jiangsu and by developing the economy.

Scientific, educational, and cultural establishments advanced continuously. Operating expenses for scientific, educational, cultural, public health, and physical cultural establishments financed from provincial financial resources rose from 679 million yuan in 1980 to over 1.47 billion yuan in 1985, representing an average annual increase of 16.7 percent and exceeding the average annual increase of 7 percent for total expenditures during the same period. Local governments at various levels also increased their expenditures and raised funds through various channels to improve buildings and teaching facilities of primary and middle schools. Notable progress was achieved in applying science and technology to economic development. Of the 9,500 scientific and technological projects completed during the 5 years, including those related to the exploitation and utilization of Huang He and Huai He, the comprehensive control of Hai Lu, comprensive surveys and planning of beaches, and double pulse hologram photography, some reached domestic advanced levels and others approached or reached the world's advanced level. Advances were made in the study of social sciences, focused on strategies for economic development and structural reform. Educational establishments developed at a fairly fast pace. The Sixth 5-Year Plan's demand to make primary education universal in the province was basically fulfilled, and fruitful results were achieved in restructuring the unitary secondary educational system, as evident from the drop in the ratio between enrolment of regular senior middle schools and that of vocational and technical schools from 5.6 to 1 to 1.9 to 1. Schools of higher learning further expanded, with enrolment of full-time students at universities and colleges rising from 84,000 in 1980 to 119,000 in 1985; they trained a total of 109,000 graduates during the 5 years, topping the Fifth 5-Year Plan target by 160 percent. Enrolment at radio and TV universities and workers' universities was equivalent to 80.4 percent of that at regular universities and colleges. Progress was also achieved in literature and art, press and publications, radio, cinema, television, public health, and physical culture.

The people's living standards improved markedly. The average wage of the province's urban workers went up from 667 yuan in 1980 to 1,037 yuan in 1985; after adjustment for price rises, the annual increase was 5.9 percent. Per capita net income of peasants rose from 218 yuan to 493 yuan; after allowing for price rises, the annual increase was 14.3 percent. Urban and rural savings deposits increased at a relatively fast pace, with a total of 9.93 billion yuan in savings deposits at the end of 1985, an increase of more than three-fold as compared with 1980. During the period, the living conditions of most urban and rural residents improved. A total of 25.99 million square meters of living quarters were built in the cities, and over 300 million square meters of housing was built with private funds in rural areas, both all-time-high figures. The daily water and natural gas supply capacity, the number of public transportation vehicles, and the road mileage in cities increased. Construction of small towns proceeded smoothly. Achievements were made in controlling and preventing environmental pollution in urban and rural areas, and more trees were planted in cities. The improvement of the people's living standards were the results of economic development, readjustment of the investment structure, and implementation of the policy of allowing some people to become better off first. Although a handful of people still face difficulties in their everyday life, the marked improvement of living standards of the majority of people during such a short period was something we could not imagine in the past. The improvement of the people's livelihood was closely related to the province's work in family planning. At the end of 1985, the province's population was some 800,000 less than the number targeted in the Sixth 5-Year Plan.

The PLA units stationed in Jiangsu performed maritorious service in supporting the local people's construction and joining them in building socialist spiritual civilizations, thereby bringing closer relations between the army and the government and between armymen and civilians. Public security, procuratorial, and people's armed forces departments dealt severe blows at serious economic crime and criminal offenses, thereby safeguarding public order and ensuring the smooth progress of reform and construction. In foreign affairs, advances were made in enhancing friendship; developing economic, technological, and cultural exchange and cooperation; and promoting friendly ties with provinces and cities of other countries. Patriotic personages from the overseas, minority nationalities, religious, and other circles also contributed their share to the modernization drive and the reunification of the motherland.

2. During the Sixth 5-Year Plan, the broad masses of cadres and people in Jiangsu strived to creatively carry out the party's principles and policies in the light of reality in the province, and they accumulated some preliminary experience.

Persist in shifting the emphasis of work. The broad masses of cadres and people in Jiangsu have firmly and promptly implemented the strategic policy decision on shifting the focus of work to socialist modernization since it was put forth by the 3d Plenary Session of the 11th CPC Central Committee.

Conscientiously eliminating the influence of "leftist" ideas and the erroneous theory and practice of "taking class struggle as the key," the people throughout the province laid a sound ideological foundation for shifting the focus of the work. Since the beginning of the Sixth 5-Year Plan, leaders have really concentrated their efforts on economic construction, and have paid close attention to reducing the scale of capital construction to ensure key construction projects. They have been speeding up the development of agriculture and light industry, and readjusting the orientation of heavy industry, following a correct guiding principle in administrative work and clarifying that the work in all fields must serve and be subordinated to the central task of modernization program, raising the economic efficiency and shifting the emphases from output value and output to variety and quality, and exercising macroeconomic control and applying economic and administrative means to organically combine macroeconomic control with microflexibility. The experience showed that in shifting the focus of the work, it was necessary to, first of all, work with one heart and one mind on the modernization drive, never wavering our determination because of other happenings. Second, leaders should concentrate their attention on the central task of economic construction and never slacken their efforts. Third, the leadership method should be improved, and the economic work responsibility system should be introduced to avoid neglecting the focus. The shift of the focus of work provided the fundamental guarantee for Jiangsu's fulfillment and prefulfillment of the Sixth 5-Year Plan.

Persist in promoting the structural reform. The agricultural production responsibility system, which was successively introduced to various localities in Jaingsu in the light of each locality's actual conditions, has effectively combined unified with separate management primarily in the forms of all-round contracting and contracting of specialized productive undertakings. It has harnessed the enthusiasm of rural households in management, brought into play the superiority of the collective economy, liberated rural productive forces, stimulated the development of agricultural production, and upheld the road of common prosperity. Areas in northern Jiangsu have not only basically solved the problem of providing the people with enough food and clothing, but have also become new bases for commercial grain and other farm and subsidiary products. The grain output of Xuzhou, Huaiyin, and Yancheng Prefectures and Lianyungang rose from 10.07 million metric tons in 1980 to 15.36 million metric tons in 1985, an increase of 53 percent. The big increase in northern Jiangsu's grain production created the conditions for industrial development. As a result of the second step in the rural reform, which changed the previous unified or fixed state purchase system to purchase by contract, large numbers of rural peasants are engaged in production according to the state plan and market needs. The structure of agricultural production was readjusted with prudent steps and a clear direction to achieve stable agricultural production, actively promote the development of industry and the building trade, and properly develop transportation, commerce, and service trades. In the urban economic structural reform, we paid keen attention to invigorating enterprises to further enliven the economy as a whole. Aside from carrying out reforms according to state plan, various localities have adopted supplementary reform measures in the light of each locality's actual conditions. In invigorating enterprises, for example, they have emulated the experience of Yanqiao Township, Wuxi County, in instituting the economic contract responsibility system and changing cadres' appointment to a system of engaging them, workers' permanent employment to a contract system, and fixed wages to a floating wage system, and they have gradually popularized such practices among collective enterprises and small state-run enterprises in cities and towns. Measures have been taken to revitalize large and medium-sized enterprises and to stimulate commodity circulation. Following the expansion of the enterprises' decisionmaking power, industrial enterprises stepped up reorganization and association. Associations of enterprises were organized in various places. In economically advanced areas, between 20 and 30 percent of their enterprises have joined economic associations. The development of economic associations has improved the enterprises' structure and raised the level of specialization. In addition, it has brought about technological progress and raised economic effectiveness. The management structure of the building industry and capital construction has also been reformed, with a number of enterprises instituting a system of responsibility for investment and a system of contracting out projects through public bidding. Regarding efforts to develop the cities' functions, experiments with comprehensive reform have been carried out in depth. The reform has improved the two cities' capacities in providing comprehensive services. New paths have been broken by Changzhou in structuring production, circulation, technology, and financing networks, and by Nanjing in invigorating city districts. The consolidation and improvement of the system of cities exercising leadership over counties has accelerated the integration between commerce and agriculture and between urban and rural areas.

The comprehensive reform experiments carried out by Changshu, Haian, and Tongshan counties (cities) strengthened economic management at the county level and satisfactorily overcame the problems in overseeing their economies. Regarding wage distribution, Wuxi and other cities instituted a system of labor insurance for retired workers to cope with the longstanding problem of the excessive financial burden on old enterprises which have too many retired workers. Positive steps were carefully taken in various places last year to initially reform price and wage systems. Rstrictions were first eased on the procurement prices of grain, edible oil, and pork. This was followed by the lifting of restrictions on their market prices. Steady steps were taken regarding vegetable prices, lifting or imposing controls as circumstances warranted. In reforming the price system, attention has been paid to the law of value and market demands in order to help develop production, establish production bases, display the dominant position of state commerce, and strengthen market management. Every effort has been made to ensure price flexibility without bringing about chaos and to control prices without having too rigid a structure. Practice has shown that in economic structural reform, it is necessary to follow unified state plans and, at the same time, adopt suitable concrete measures in light of local conditions; it is necessary to uphold the general principle and, at the same time, borrow the successful experience gained by the masses to supplement the general principle with auxiliary measures; and it is necessary to have a positive, exploratory spirit and, at the same time, adopt prudent, careful methods and measures in light of the capacities of the state, the collectives, and the individuals. Only by continuing the economic structural reform and gradually setting up a vigorous management structure in various sectors can we ensure long-term, steady economic growth.

Opening to the outside world was continued. Jiangsu, especially a number of places in the province's south, began to carry out economic and technological exchanges with many foreign countries very early. Jiangsu's economic links with foreign countries have further developed since the State Council designated Nantong and Lianyungang open coastal cities and Suzhou, Wuxi, and Changzhou Prefectures open economic zones. As a result, Jiangsu's economy has become outward oriented. The five open cities have more economic power. They accounted for 54 percent of Jiangsu's industrial and agricultural output value and 61 percent of its financial revenue. In 1985, they procured 3.55 million yuan worth of goods for export, an increase of 16.2 percent over the previous year and 60 percent of export goods procured in the whole province. At the same time, they signed contracts to import 642 technologies, worth $470 million. Most of the imported projects were productive in nature and primarily for increasing their export capacities and renovating old enterprises. Work has begun to digest the imported technologies and to cope and improve the imported equipment. In addition, the cities have approved 44 joint ventures. General planning for the Nantong and Lianyungang economic and general planning development zones is complete, and work has begun to implement the plan. While opening themselves to the outside world, they also actively sought to establish lateral economic ties at home. Lianyungang City is developing its port in cooperation with seven provinces and regions along the Lianyungang-Lanzhou railway line. It also reached agreement with a number of provinces, municipalities, autonomous regions, ministries, state commissions, colleges, research institutes, and military industrial units on more than 200 joint projects. Eighty of these projects have been completed and are in full or partial operation. During this period, Jiangsu has made major progress in widening the path of cooperation. During this period cooperation in our province advanced from cooperation in mainly materials to a new phase of comprehensive cooperation in materials, technology, qualified personnel, and funds. Our province entered economic cooperation with provinces and autonomous regions in central and west China. In 1985 alone, the cooperation in funds amounted to more than 470 million yuan and the cooperation in materials was worth over 2.12 billion yuan. Nanjing City cooperated with Wuhan, Chongqing, and other large cities along the middle and upper reaches of the Chang Jiang to jointly develop the river's "golden water channels." Taking advantage of its position as a communication center, Xuzhou City established ties of economic and technological cooperation with adjoining areas in Jiangsu, Shandong, Henan, and Anhui provinces. Experience in the past two years shows that to develop a favorable situation in opening to the outside world, we must do three things: First, we must expand exports in order to earn more foreign exchange; second, we must pay attention to the utilization of foreign capital and the importation of technology; third, in accordance with the principle of doing what we can, we must step up the construction of the urban infrastructure and in various ways create a favorable environment for investment. Our persistence in opening to the outside world and in promoting internal economic cooperation has stimulated further economic development throughout the province.

The management of macroeconomic activities was strengthened. The Party Central Committee and the State Council made a series of policy decisions to tighten controls over the macro aspects of the economy when disproportion factors appeared in the national economy in the fourth quarter of 1984. Governments at all levels in our province conscientiously carried out these decisions by adopting macroeconomic control measures in the light of actual conditions. Notable results were achieved. By the end of 1985, the province's total credit was kept within the quota fixed by the state lending plan; the use of foreign exchange was restrained to remain within the adjusted quota approved by the state; the money supply shrank by 17 percent over 1984; budgetary investment in fixed assets stayed within the state plan; and the irrational increase in consumption funds also brought under control. Many localities and departments did their best to explore feasible ways to exercise macroeconomic control. For example, after the state moved to control the scale of investment in fixed assets, Shazhou County promptly established some requirements aimed at raising quality and economic results and improving technology and management. Notable results were achieved in popularizing its experience throughout the province. The experience of Changzhou City and Jingjiang County in creatively using their funds was also popularized throughout the province. This forcefully stimulated the development of production. Our province's economy was able to maintain a sustained growth while exercising macroeconomic control because we did fairly well in invigorating the microeconomy while controlling the macro aspects of the economy. This means that we exercised controls over macroeconomic operations in accordance with state policies by proceeding from actual conditions; we did our best to carry out construction and production in accordance with our capacity; we made loans available and readjusted economic operations in an effort to invigorate the microeconomy while exercising macroeconomic control and make macroeconomic control promote microeconomic development.

We persisted in building two civilizations simultaneously. In recent years, while stepping up the building of a material civilization, various localities have begun to pay attention to the building of a spiritual civilization. They have conducted education on situations, policies, the four basic principles, as well as education to encourage people to cherish lofty ideals and moral integrity, to become better educated, and to observe discipline. In light of the people's thoughts in the new period, a variety of colorful educational activities have been carried out, including drives to make people models and urging others to learn from them; to promote the "five stresses, four beauties, and three loves"; to mobilize armymen and civilians to jointly build civilized units; and to invite heroes from the battlefront to report on their deeds. Some units invited people to tell stories of their pursuit of ideals and discipline and to use their own revolutionary thinking and spirit to inspire the vast numbers of people and arouse their tremendous enthusiasm in building socialism. Models of good ideological and political work emerged in various trades and professions. They included the Chenguang State Machinery Factory in Nanjing, the Xiexin Wool Textile Mill in Wuxi, the Yangzi Ethylene Project, and the Xinjiekou Department Store in Nanjing. The vast numbers of cadres were affected by economic measures and administrative actions and were able to realize the role of ideological education and political work. They saw the tangible effects of material civilization and felt the invisible power of spiritual civilization. They were encouraged to attend to ideological, political, and economic work simultaneously in order to obtain results in both spiritual and material civilizations.

3. During the transitional period of the Sixth 5-Year Plan, which had profound historical significance, we encountered many new circumstances and problems and had shortcomings and faults in work. There are still many difficulties and contradictions on our road.

In this period, China carried out strategic shifts in its economic development, management structure, and foreign economic relations. This had a profound historical significance in ensuring the sustained and balanced development of our national economy. In this transitional period, the vast numbers of cadres and people in Jiangsu did a tremendous job and produced impressive results. Their work and achievements must be fully affirmed. However, because our thinking was not adequately adapted to the situation, our work was not very solid and our workstyle was not satisfactory; we have left many problems unsolved. In the process of reform, we tended to use old methods to resolve new problems. After the scope of mandatory planning was reduced and the scope of guidance planning and market regulation was expanded, we failed to satisfactorily handle the relationship between planning and marketing. In our economic construction, infrastructure, such as energy and communications, remained the weak link despite some progress. Along with the development of production and improvement of the people's living standards, contradictions in these sectors will become more prominent. The idea of taking agriculture as the foundation weakened. Input into farmland capital construction declined in recent years. In some areas, water conservancy projects were in disrepair, land deteriorated, and farm machinery became old. The economic effectiveness of our industry did not rise fast enough, some of our products were inferior in quality, high material consumption continued without much change, and our technological and managerial standards and organizational levels were not very high. In addition, progress in controlling urban and rural environmental pollution was slow, and in some places, new sources of environmental pollution appeared. In social welfare, we made some progress in recent years. However, because this work was neglected for so long, our efforts still lack for behind the needs of our economic development. In building spiritual civilization, we failed to give adequate attention to it at a certain period. We failed to fully study ways to integrate ideological and political work with our economic work and carry out the task accordingly. Not many leading comrades went to the grassroots units to gain experience and to serve them. We must make serious efforts to resolve all these questions in the future.

II. Goals and Tasks of the Seventh 5-Year Plan

The Seventh 5-Year Plan is a crucial period for all-round reform of the system of economic, scientific and technological, and educational management. It is also an important period for making material and technical preparations to achieve better economic performance in the 1990's. Success in our work in these 5 years, which will result in a more coordinated development of the socialist modernization program, is of tremendous importance in further consolidating and developing the current excellent situation and in realizing the grand goals by the end of this century.

In keeping with the guidelines of the National Conference of Party Delegates and the fourth session of the Sixth NPC and based on the "Suggestions for the

Seventh 5-Year Plan on Economic and Social Development" adopted at the enlarged meeting of the Third Plenary Session of the Seventh Provincial CPC Committee, the provincial people's government has made special efforts to analyze the overall economic and social development in our province and has compiled the "Draft of the Seventh 5-Year Plan for Economic and Social Development of Jiangsu Province." Some revisions have been made to the draft after preliminary deliberations at the 18th Session of the Standing Committee of the provincial people's congress to be examined, approved, promulgated, and put into force.

The goals to be achieved in Jiangsu's Seventh 5-Year Plan are: By 1990 the province's total industrial and agricultural output value shall be 187 billion yuan, up 47.4 percent from 1985, with an average annual increase of 8 percent. Gross national product shall be 100.1 billion yuan, up 48.9 percent, with an average annual increase of 8.3 percent. National income shall be 85.2 billion yuan, up 46.9 percent, with an average annual increase of 8 percent. Financial revenue shall be 11.8 billion yuan, up 33.8 percent, with an average annual increase of 6 percent. Natural population growth rate shall be kept below 10 per thousand in the 5 years. Scientific and technical progress as well as intellectual development shall be accelerated. All kinds of social undertakings shall be developed. The quality of life as well as the living environment and housing conditions shall further improve. The actual consumption level of urban and rural residents shall increase by 6 percent annually. The pattern of consumption for the people in our province shall gradually take on the characteristics of a comparatively well-off family.

1. On Structural Reform

The central authorities have called for carrying out comprehensive and thorough reform of the economic system in the Seventh 5-Year Plan and straightening out economic relationships in all aspects, so that reform and construction can proceed hand in hand and promote each other's advance. Reform shall be carried out primarily in three aspects: 1) further invigorating the enterprises, the large and medium-sized state-owned enterprises in particular, so that they will truly become relatively independent economic entities and will act as socialist producers of and dealers in commodities, practising independent operation and assuming sole responsibility for their own losses and profits; 2) Further developing socialist commodity markets and gradually perfecting the market structure; 3) gradually switching from direct state control of enterprises to indirect control and establishing a new socialist system to exercise macroscopic management. In accordance with these general requirements of the central authorities, specific guidelines have been studied and presented to our province.

In rural reform, we should sum up experiences and further perfect the output-related system of contracted responsibilities on a household basis, thus firmly, steadily, and thoroughly promoting the development of the second-stage rural reform. The work of switching from unified grain purchase to contract purchase has just got onto the right track. It should be gradually improved and perfected. While maintaining prolonged stability of the two-tier operating system based on household contracts, we should undertake to improve services. Sound regional cooperative economic organizations should be established in accordance with actual needs and capabilities of the localities so that peasant households will be given comprehensive services in information storage, transportation, sales, and so on. This will gradually promote socialization and specialization. While insisting on certain essential requirements and following the principle of voluntary participation by the masses, we should proceed step by step, encourage business operations of varied forms and appropriate sizes, and support the development of integrated entities and specialized households. Continued efforts should be made to readjust the production structure; to correctly handle the relationships between grain production and a diversified economy, between agriculture and the rural industry, and between production and circulation; to form into an organic whole the ideas that "without agriculture, there is no stability," "without industry, there is no prosperity," and "without commerce, there is no flexibility": to promote rural economy; to gradually expand the comprehensive scale of rural commodity production; and to considerably raise economic results. Special efforts should be made to speed up the reform of the system of commodity circulation in rural areas, open up new business opportunities, and find every possible means to clear obstacles in commodity circulation. Supply and marketing cooperatives should truly become collective-owned commercial establishments of the peasants and match the development of the.commodity economy in rural areas.

On the reform in cities, we must continue to make it the central task to further invigorate enterprises, in particular, state-owned large and medium-sized enterprises. We must continue to simplify administration and delegate powers to lower levels in order to enhance the self-transformation and self-development capacity of enterprises. Urban collective enterprises and town and township enterprises must continue to perfect the responsibility system of "one contract and three changes," and state-run small enterprises must be revitalized through lease, concessions, and other forms. Regardless of size, enterprises must look to themselves, constantly perfect their various economic responsibility systems, continue to enforce the plant director (manager) responsibility system, and improve their quality. We must, through reforms, perfect the relations between large and medium-sized enterprises on the one hand and small ones on the other, between state-run and collective enterprises, and between processing industries and industries producing raw and semifinished materials in order to further enhance industrial organization and the capacity of enterprises to supplement one another. We must gradually improve the market system and stimulate commodity circulation. While developing the consumer goods market, we must expand the market for means of production, strengthen relations between urban and rural areas, and smooth out the relationships between producers and consumers and between agricultural and industrial departments. The state-run commercial sector, the supply department, and supply and marketing cooperatives must play their predominant role and take an active part in market regulation. We must step by step develop the capital, technical, and construction markets and effect a rational flow of the labor force in order to meet the needs in the development of the commodity economy. To establish and perfect the socialist market system, the key is to reform the price and price control systems step by step in a planned way according to the State Council's unified arrangements.

In the course of reforming the price system, we must stick to the principle of moving forward steadily and integrating decontrol with adjustment and fully take into consideration the receptivity of the state, enterprises, and people in order to maintain basic stability of commodity prices as a whole. We must continue to successfully carry out reform in the planning, revenue tax, banking, labor, and wage systems. The organizational structure of economic management department should be strengthened while the specialized economic management departments should expand its control over the production and operation of not only enterprises directly under its jurisdiction but also of enterprises of the entire industry. As economic restructuring is being intensified and the national economy is developing, more principles and regulations on economic relations and activities should be finalized in the form of laws so that laws will become an important means to regulate economic relations and activities. Therefore, we must attach tremendous importance to economic legislation and judicial work so that all economic activities will have laws by which to follow. We must ensure that laws are strictly observed and enforced.

On scientific, technical, and educational reform, we must continue to intensify it according to the guidelines of the Party Central Committee's two "decisions." In scientific and technical reform, we must bring into full play the role of the technical market, increase enterprises' technical development ability, and bring about a still better connection between science and technology and production. The management of scientific research units must be improved; the academy president's (institute director's) personal responsibility system must be perfected; and the system of engaging professionals and technicians must be popularized. Reform should continue in the appropriation system. To strengthen the self-development capacity of scientific research units, they should externally follow the remunerated contract system, and internally, they should follow the scientific-research contract responsibility system. In the reform of the educational system, we must accelerate the training of qualified personnel by running schools of all forms at all levels through all possible channels. Regular schools should be run and managed at different levels. Structural reform of secondary education will continue, and the development of vocational and technical education will accelerate. The university and college enrollment system must be reformed, and the scope of training personnel by commission and selective quotas must be expanded. Normal education must be strengthened and reformed to improve the quality of teachers. Research and study of educational and scientific theories must be stepped up; educational philosophy must be quickly reformed; contents and methods of teaching must be improved; and the quality of teaching materials must be raised. On reform in the cultural, public health, and physical education fields, we must further emancipate our minds, continue to adopt effective policies, and carry out the reform in depth.

Reform is a gigantic social systems engineering project with extremely arduous and complex tasks. In the course of reform, old and new structures will continue to coexist and interact, and thus they are liable to give rise to all sorts of loopholes in management and frequent imbalances, or even contradictions, between microflexibility and macroeconomic control. At the same time, reform represents a profound and sustained transformation which does not have a ready model. Some mistakes in our endeavor to explore new ground cannot be avoided. However, compared with the mainstream of reform, which has stimulated the development of productive forces, difficulties and problems in our course of advance are undoubtedly secondary, regional, and temporary phenomena. We should not raise doubts about reform because of contradictions we encounter. Problems cropping up in the course of reform can only be resolved not by taking the road of retrogression but through the continuous deepening and perfecting of reform. As far as leaders at various levels are concerned, they should, with political enthusiasm and enterprising spirit in the practice of reform, seek truth from facts, proceed cautiously, map out careful plans, and exercise meticulous guidance in order to promptly discover and solve problems in the work. With the clear-cut directions, principles, and measures for reform put forth by the central authorities and as long as we closely rely on the broad masses of people throughout the province, tailor measures to local conditions, and realistically sum up experience in practice, we will certainly continue to promote reform on various fronts.

2. On Agriculture

During the Seventh 5-Year Plan, we should further raise our understanding that agriculture is the foundation of the economy, strengthen leadership, and deepen the reform in order to promote agricultural production. Under the Seventh 5-Year Plan, the total value of agricultural production (including industries run by villages and lower units) in 1990 shall be 55.6 billion yuan, topping that of 1985 by 37.3 percent and averaging 6.5 percent annual growth. In line with the principle of sparing no effort in promoting grain production and actively developing diversified undertakings, we will adopt measures suited to local conditions to readjust the structure of agricultural production. Since agriculture is the foundation of the economy and grain is the foundation of agriculture, we should pay close attention to grain production and arrange the production according to the demand for "steady increase, 1,000 jin per capita output, and self-sufficiency with a little surplus to be delivered to other localities," striving to stabilize annual output between 31 and 34 million metric tons. It is also necessary to achieve steady cotton output at around 600,000 metric tons annually. Production of cash crops must be based on domestic and international market needs, and adequate provincial and regional plans should be mapped out to ensure rational distribution of crops. It is necessary to exploit natural resources in an all-round manner and develop forestry, animal husbandry, fishery, and sideline production. Existing bases for producing grain, cotton, edible oil crops, silk cocoons, and hogs should strive to increase output, improve quality, and offer a large proportion of marketable products. It is necessary to step up efforts to carry out plans to build bases for agricultural and subsidiary products and export commodities. In developing agriculture from now on, we will, in addition to implementing policies, rely more and more on scientific and technological progress to improve agricultural production conditions. More investment in agriculture will be made from provincial financial resources, and the practice of spending 25 percent of the investment raised in the province for agricultural capital construction will be gradually resumed. City and county governments should adopt various means and increase agricultural investment through various channels, with the focus on building irrigation and water conservancy facilities and improving production conditions. It is necessary to continue to implement the policy of "actively supporting, rationally planning, correctly guiding, and strengthening the supervision of" the development of village and town enterprises and offer practical guidance case by case in order to make the best use of economic advantage of various localities. In areas with relatively developed village and town enterprises, it is necessary to especially improve quality and efficiency and divert the market target from mainly serving domestic needs to equally stressing the development of overseas markets. In areas with a relatively late start in village and town enterprises, they should make ample use of local resources and set up various kinds of enterprises in a more effective way. It is necessary to carry out technical transformation of existing enterprises in a planned and selective manner. Efforts should be made to carry out the "spark plan" and strive to complete a number of projects that require a short construction period and little investment but will yield quick economic results. It is necessary to pay special attention to raise the quality of management, improve its basic work, and turn out standard products. It is also necessary to uphold the policy of "subsidizing agriculture with industry"; to balance personal incomes in industry and agriculture; to develop agriculture along the direction of "building up agriculture on the basis of industry"; and to reinforce material and technological foundations in order to promote a sustained, steady, and balanced development of agriculture and the rural economy as a whole.

3. On Industry

During the Seventh 5-Year Plan, we must consider the increase of economic effects as the key to industrial development, striving to improve product quality, lower material consumption, and maintain an appropriate growth rate. The Seventh 5-Year Plan stipulates that the total industrial output value in 1990 should be 131.4 billion yuan, 52.1 percent over that of 1985 and averaging an 8.7 percent annual increase. This is a positive growth rate, yet it leaves some leeway. This is because, on the one hand, we want to further balance economic relations, prepare a good economic environment for restructuring, and focus our attention on increasing economic effects, improving product quality, and elevating our technical and management levels. On the other hand, we have taken into consideration that in the near future, the production and supply of energy and raw and semifinished materials will not increase markedly, the problem of a shortage of transportation will not be greatly changed, and shortages of funds and foreign exchange cannot be greatly countered. Historical experience shows that the plan targets, if safely set in view of a comprehensive balance, are conducive to protecting and increasing the enthusiasm of the masses and production units and ensuring that the national economy develops harmoniously and proportionately. Under the precondition that we must seek economic effects and social benefits and at the same time must not disrupt plans for capital construction, credit and loans, foreign exchange, and consumer funds, we must strive to achieve a sustained, higher speed according to needs and possibilities. This will help ensure good markets and export and revenue situations and preserve the good tendency of the vigorous economic development. Capital construction and technical transformation during the Sixth 5-Year Plan constituted new production capabilities. More new input will be added during the Seventh 5-Year Plan. As reform is intensified, more enterprise potentials will be tapped. If we just do our work well, the results of implementing the plan may and should surpass the above-mentioned targets.

To improve economic effects, efforts should be made chiefly to improve our technical and management levels. We should conduct technical transformation, remodeling, and expansion of existing enterprises on the present basis. This is the important way to increase economic effects. During this period, our province's technical transformation should be conducted to improve product quality and processing levels, increase variety, and lower consumption of energy and raw and semifinished materials. Emphasis should be placed on large and medium-sized enterprises which have a bearing on the national economy as a whole, the backbone enterprises which can act as role models in industrial technical progress, and enterprises which are charged with the mission of exports. The machinery and electronic industries are the equipment department of the national economy and, therefore, should be the first to undergo technical transformation. Technical transformation should be perfectly connected with industrial adjustment and enterprises' structural reorganization. It should be conducted step by step in selected key enterprises, and systematically throughout an industry instead of the past scattered technical transformation here and there. We must encourage enterprises and the masses of staff members and workers to make rational proposals and launch a mass movement in technical innovation. We must make full use of the national defense industry's technological superiority and successfully effect the transfer of military industrial technology to civilian industries. We must pay attention to the world's new technological revolution, selectively use new technologies to reform our traditional industries, and actively develop new technologies and form certain new industries. At the same time, we will continue to import advanced technology and equipment, stressing digestion, assimilation, imitation, and innovation and gradually producing our own technologies. We will strive, through hard work, to have over 50 percent of our major industrial products by the end of the Seventh 5-Year Plan match the international standard of the late 1970s and early 1980s, with some of them reaching the current international advanced level. We must attach importance to technical transformation and still greater importance to management. In view of the practical condition of our province, improvement and strengthening of management and elevation of the operational management level are of more urgent and immediate significance. All industries must study their respective economic and technological policies and, according to the principle of specialized and socialized great production and economic feasibility, make efforts to form various types of associations of scientific research, design, and production units. Enterprises must gradually enforce all-out quality control and cost and financial management, do the foundation work for enterprise management well, and perfect all the management systems for quality control, energy conservation, and consumption reduction. Enterprises with a better foundation must promote modernized management and establish a high-efficiency management system.

4. Concerning the Key Construction Projects

In the Seventh 5-Year Plan, while maintaining the appropriate scale of investment in fixed assets, we should reasonably readjust the investment structure, guarantee the construction of key projects in energy, communications, and raw and semifinished materials, and strive to increase investment returns. The state has earmarked 25.8 billion yuan of investment in fixed assets for our province, of which 16.7 billion yuan is investment in capital construction projects, 47.9 percent more than the Sixth 5-Year Plan. Some 60 large and medium-sized projects will be built, including the Yangzi Ethylene project, the Yizheng Large Chemical Fiber Plant, the Lianyungang Soda Plant, the Nanjing Automobile Manufacturing Plant, the No. 742 Microcomputer Scientific Research and Production Complex, and other projects which have been continued or have just started. The province also plans to build some civil aviation facilities and ports. On completion, these projects will provide a powerful basis and support for Jiangsu's economic development and technical progress. In industrial production, more manufactured goods and fewer farm and sideline products are being used as raw and semifinished materials. Transportation has also improved. These very important factors constitute a powerful force for sustaining our province's economic growth. The question of electric power should be addressed here. The acute problem in the supply and demand of electric power currently experienced by our province has created many difficulties for production, construction, and the people's livelihood. Great efforts should be made to gradually solve this problem. During this period, our province has listed power projects as the most crucial of the key projects. The planned construction scale is 3.38 million kilowatts. Large and medium-sized projects included in the state plan are the power plants in Xuzhou, Jianbi, Tianshenggang, Yangzhou, Xinhai, Yancheng, and the No. 2 Nanjing Thermal Power Plant. Other power plants that combine hydroelectric and thermal power as well as self-contained power stations of large enterprises will also be built. Therefore, by 1990 the installed capacity will reach 6.98 million kilowatts, nearly doubling the figure at the end of 1985. By that time, power shortages in many places will be eased. Meanwhile, the construction of corresponding projects for power transmission and transformation should be stepped up. Preparatory work for the construction of the Gishuyan Power Plant, the Xuliujing Power Plant, and others should be done well. All cities and counties should also closely attend to the small and medium-sized generating sets now under construction, in addition to the key projects of the state and the province.

V. Concerning Foreign Exchange Earning Through Exports

In the Seventh 5-Year Plan, we should persist in opening to the outside world and raise the standard of work in this field. It is necessary to fully realize the importance of the "two cities, one area, and four ports" (namely, Nanjing and Lianyungang Cities; the Suzhou-Wuxi-Changzhou area; and the ports of Nantong, Lianyungang, Zhangjiagang, and Nanjing) as well as the advantages of opening them to the outside world. We should strive to do our work well, vigorously develop foreign trade, speed up the use of foreign capital and the import of technology, and actively develop knowledge- and technology-intensive enterprises as well as hi-tech enterprises. Large amount of foreign exchange is needed to import advanced technology and the essential materials, to serve as principal and interests for repaying the foreign capital used, to develop economic and technical cooperation with foreign countries, and to carry out technological exchanges. Therefore, we should regard enhancing the capacity to earn foreign exchange through exports as the key to ensuring success in

production and construction. We should explore new approaches to earn foreign exchange through exports in order to meet the need of the ever-expanding economic and technical exchanges with foreign countries. This is a strategic measure for invigorating our province's economy. The Seventh 5-Year Plan requires that by 1990 the province's export volume reach $2.4 billion to $3 billion, an increase of 56 to 95 percent over 1985, with an average annual increase of 9 to 14 percent, and that some $500 million to $750 million of foreign capital be used. To earn more foreign exchange through exports, it is necessary to set store by the quality of export commodities, exploit the advantages of light industrial products and textiles, and increase the exports of farm, sideline, and native produce, as well as new types of foods. To promote exports of chemicals, pharmaceuticals, building materials, and mineral products, more varieties should be offered. We should improve the technology for manufacturing machinery and electronic products and successfully combine the mechanical and electrical equipment and instruments to provide a good foundation for exports. Measures to be taken include:
1) Establishing a system for producing export commodities. In keeping with the principle of combining foreign trade, industry, and agriculture, we should run well the bases for producing farm, sideline, and native produce for export, and convert into specialized export commodity plants those enterprises whose export products account for more than half of the products manufactured and whose foreign exchange earnings have reached a certain level. Meanwhile, armament enterprises and village and town enterprises should be encouraged to produce export commodities so as to exploit new advantages in foreign trade. 2) Improving the product mix of export commodities, and gradually switching from exporting primary products to exporting end products. 3) Constantly implementing inducement policies and measures such as the system of profit retention for those who have earned foreign exchange through exports, so as to mobilize the enthusiasm of enterprises and individuals for producing and supplying export commodities. 4) Actively promoting the integration of foreign trade with industry, agriculture, and technology, and of imports with exports; and give selected, qualified large and medium-sized enterprises the power to deal with foreign firms directly. Open areas and cities should run well the corporations for foreign economic relations and trade which have been approved. 5) Actively exploring the international market, adopting flexible and varied trading methods to increase transaction volume, and gradually establishing and perfecting sales and service networks abroad. We should also develop tourism, do a good job of contracting for construction projects abroad, and expand labor service cooperation and technical exports.

6. On Science, Education, and Culture

During the Seventh 5-Year Plan, we should accelerate the development of scientific and educational undertakings and gradually adapt them to meeting the needs for developing the economy and improving the people's livelihood. Science and technology should be oriented to economic construction and closely combined with production to ensure that Jiangsu's economy will develop along with scientific and technological progress. Currently it is of strategic importance to stress science and technology in all quarters, instilling in them a pressing sense of speeding up scientific and technological development. It is necessary to develop all undertakings in the fields of production, construction, and circulation along with scientific and technological progress, and to earnestly concentrate efforts to tackle key projects assigned by the state and the province. Investigation should be conducted in all trades for finding out problems existing in production and solving them through scientific research. At the same time, we should promptly apply the fruits of scientific and technical projects that can produce quick economic results to promote production. It is also necessary to explore new areas of technology and gradually set up new industries. Study of agricultural sciences, development of technology, and farm mechanization should be listed on the agenda. It is necessary to step up the study of philosophy and other social sciences, especially economic theory, for exploring and solving new problems cropping up in reform and construction. Since talented personnel are the key and education the foundation for promoting scientific and technological progress and accelerating development in all fields of endeavor, we must earnestly strengthen basic education, actively popularize the 9-year compulsory education system, continue to improve higher education and adult education, and raise the quality of education at all levels. It is also necessary to gradually institute and perfect a system of continuing education for scientific and technical personnel and teachers, and to ensure that an increase in educational expenditures must be higher than that of the regular financial revenues of provincial, city, and county governments, and that educational expenses per student enrolled in school be increased accordingly. The proportion of educational appropriations in financial expenditures should be gradually expanded, and increases in capital construction investment should first be used for educational undertakings. It is necessary to intensify the supervision of educational expenditures and persist in running school industriously and thriftily. Further efforts should be made to promote cultural, public health, and physical sports undertakings so that they can advance along with economic development. It is also necessary to vigorously tap potentials and coordinate state, collective, and community forces to jointly achieve progress in these undertakings.

7. On the People's Livelihood and Social Welfare

The aim of socialist production is to continuously satisfy the people's growing material and cultural needs. This is the starting point of all policies for socialist modernization. While formulating Jiangsu's Seventh 5-Year Plan, we paid attention to properly handling the relationship between improvement of the people's livelihood and production and construction on the one hand and the increase in workers' wages and the growth of labor productivity on the other hand. We made all-round arrangements to ensure that the people's livelihood would continue to improve on the basis of development of production and better economic effectiveness. It should be pointed out that while increases in workers' wages and greater employment opportunity constitute an important aspect of continuously improving people's livelihood, providing better public facilities and living conditions is another important aspect. The latter is the area in which we lag behind. We should intensify the construction of such public facilities as water, power, and gas supply; drainage works; roads; transportation; and telephones, and should speed up housing construction in a planned manner and within the limits of our resources. In order to provide clean and comfortable living and working conditions for the people, we should step up the monitoring, preventing, and controlling of environmental pollution by industrial waste, noise, and other public hazards, as well as plant more trees and build more gardens to beautify the environment. We should also gradually set up and improve a social security system, develop social welfare undertakings, and actively take care of the life of the aged, children, and disabled by providing adequate relief for them. We should show concern for and assist the construction of old revolutionary bases and help the impoverished there to become better off through developing production. While continuing to improve the people's livelihood and raise their material and cultural living standards, we should also advocate the spirit of working hard and arduously, strictly control excessive growth of consumption funds, and guard against irrational competition for higher wages and better welfare.

8. On Geographical Distribution of Regional Economic Undertakings

Jiangsu is a province in the eastern coastal region with a comparatively better economic foundation. We should accelerate our pace in introducing investment from abroad and establishing lateral ties at home, and make more contributions to China's economic development in accordance with the central authorities' instruction on correctly handling the relations among China's east, central, and west economic regions and on expediting the development of the eastern region. Geographically, Jiangsu is divided into the southern and the northern regions. As the two regions had different economic foundations, they are now at different levels in economic development. The principle of actively improving the conditions of southern Jiangsu and accelerating the development of northern Jiangsu, put forward by the provincial party committee, is an important strategy for Jiangsu's regional economic development. In the past 3 years and more, the province and all cities and counties have done a great deal of work and explored some ways to improve the conditions of the southern region and develop the northern region. On the basis of what we have done, we should strive to make greater achievements during the Seventh 5-Year Plan. The southern region should take advantage of its favorable natural and geographical conditions and its comparatively more developed commodity economy to strive to raise its science, technology, and modern management to the world's advanced level. It should speed up the modernization of agriculture, improve the technology and equipment of its village and town enterprises, actively develop new urban industries, and develop the production of high-grade consumer goods and the tertiary industry. After the productive forces are enhanced to a considerable extent, we should help the people in the southern region become well-to-do first. Northern Jiangsu should take full advantage of its abundant natural resources and make proper development and use of its water areas, beaches, the old Huang He riverbed, and other resources. It should step up the construction of communications, electric power, water conservancy and other basic facilities. The provincial authorities should build, renovate, and expand a number of key projects in the northern region according to plan; develop education and accelerate personnel training there and support it with flexible policies and materials; and transfer office cadres to work there on a rotational basis. Various provincial organs have already dispatched 600 persons to grassroots units. In the last few years, some counties and townships in northern Jiangsu have gained some experience in success. We should make great efforts to sum up and popularize their experience to promote economic development in the region. By making efforts in various respects, we should gradually turn northern Jiangsu into a production base for yielding a large quantity of commercial grain and agricultural and sideline products, and into a production base for energy, raw and processed materials, and food, and develop a number of processing industries there according to local conditions. Southern Jiangsu and northern Jiangsu should take their own road of economic development in consideration of their own realities. At the same time, they should support and cooperate with each other to promote a common prosperity. This is not only important to realizing the objectives of Jiangsu's Seventh 5-Year Plan, but is also of far-reaching significance to accomplishing the province's grand objectives for the period between now and the end of the century.

In order to ensure the fulfillment of the Seventh 5-Year Plan, we should step up the building of socialist spiritual civilization while building material civilization. Socialist construction includes the building of socialist material civilization and the building of socialist spiritual civilization, and we must persistently build both. If we build only material civilization and neglect spiritual civilization, we will be unable to guarantee a correct and socialist orientation for our modernization drive. The development of education, culture, public health, and physical culture is an important prerequisite for building material civilization, as well as for raising the people's ideological awareness and moral standards. We should persistently keep to an orientation of serving the people and socialism, correctly handle the relationship between economic results and social benefit, and put social benefit above all else. In education, we should seriously implement the policy of promoting the moral, intellectual, physical, and aesthetic development of students. Schools should intensify education in the love of labor to varying degrees according to their specific requirements and train qualified personnel in various specialities. Teachers should teach and cultivate students and be worthy of their name. Literary and art workers should strive to create more and better works that reflect the new look of the times and enrich the people's cultural life. We should actively promote mass cultural and sports activities to invigorate the people's spare-time cultural life. Ideological and political work is a fundamental guarantee to keep the four modernizations on the right track. We should persistently educate the cadres and people in the four basic principles and to have lofty ideals, moral integrity, knowledge, and a sense of discipline. We should enhance our ability to resist corruption by capitalist and feudalist thinking under the new circumstances and strive to foster a civilized, sound, positive, and enterprising mental attitude. We should carry out education in the current situation and policies as an important part of the ideological and political work taking into consideration reality; we should further identify the people's thinking with the line, principles, and policies laid down since the 3d Plenary Session of the 11th CPC Central Committee. In the economic field, we should energetically advocate good working ethics and enterprise reputation; run business operations and factories in a civilized way; oppose the attitude of "putting money above all else" and the behavior of seeking private gains at public expense; abide by law and discipline; and resist all irregularities and decadent business practices. Government organizations at all levels should set examples of correcting unhealthy tendencies. The majority of our government functionaries is conscientious, diligent, and hard working, and the main trend is good. However, problems do exist in some localities and organizations. For instance, some of their personnel are bureaucratic; neglect their duties; violate regulations; engage in business operations for profits; vie to go abroad under various pretexts; or go sightseeing at government expense. Others even commit such serious crimes as embezzling and taking bribes. We must resolutely correct these phenomena because they not only hurt the prestige of the government but also corrupt social values. Leading organs and leading cadres at all levels should set strict demands for themselves and set an example in performing good deeds to bring about a fundamental change for the better in the standards of social conduct. We should strengthen the building of democracy and the legal system and carry out education in legal knowledge among all citizens group by group and step by step. We should guide the people in learning legal knowledge, knowing and obeying laws, and conscientiously applying the law in dealing with serious crimes, including serious economic crimes. At the same time, we should strive for a general improvement in public order and persistently take measures to bring about a fundamental change for the better in public order and in the standards of social conduct.

Deputies, the tasks during the Seventh 5-Year Plan are heavy and arduous. If we unite and work hard in a down-to-earth way in the spirit of the foolish old man who moved mountains, we can surely fulfill the Seventh 5-Year Plan completely, and we can surely do better during the Seventh 5-Year Plan than we did in the last 5 years becuase we now have a clear and definite blueprint and many favorable conditions. After we accomplish this task, Jiangsu's economy will have more vitality and greater strength; our levels of science, technology, and management will be raised; and the living standards of urban and rural people will be further improved. By then, this province will enter a new period of vigorous economic development, and we will be marching toward the grand objectives set for the period between now and the end of the century.

III. The Principal Tasks in 1986

1986 is the first year of the Seventh 5-Year Plan. It is also the first year of the crucial period for the overall reform of the economic structure. It is highly important to do a good job of economic construction and all other work this year in order to make a good start on the implementation of the plan. The "Draft Plan for Jiangsu's Economic and Social Development in 1985," drawn up by the provincial people's government, will be separately submitted to our fellow deputies for deliberation.

On this year's economic work, we must continue to keep total consumer demand under control to guarantee steady growth in the economy. With this general requirement in mind, we must not only further enliven our local economy, but also strengthen and improve our overall management. We must stop demanding uniformity in everything. We must continue to keep our excessive consumer demand under control and at the same time strive to improve supply. We must maintain appropriate economic growth rates on the basis of increased economic results. According to this year's plan, the total value of industrial and agricultural output should increase at a rate of 8.7 percent of last year's. Of that total, the value of industrial output will rise at a rate of

10 percent while the value of agricultural output will rise at a rate of 3.5 percent (not including industries at and below the village level). The gross national product is to increase by 8 percent while revenues are to increase by 9.6 percent (guaranteed rate).

Considering what we achieved in the first quarter, the province's economic situation is good. The value of industrial output reached 20.7 billion yuan, an increase of 7.6 percent over the corresponding period of last year. Revenues amounted to 2.27 billion yuan, an increase of 6.8 percent. It should be noted that while there are numerous favorable conditions in our production, we also face quite a few difficulties. Therefore, we must seek unity of thinking, develop a positive and enterprising spirit, and strive hard to fulfill this year's economic tasks.

1. Strive for bumper harvests by every possible means

The grain production task the state sets for our province is 31.5 million metric tons, while the cotton production task set for our province is 600,000 metric tons. We must guarantee the fulfillment of both tasks. To guarantee the successful production of grain and cotton we must pay attention to acreage, strengthen field management, and increase per-mu yields. It is necessary to do a good job of preventing floods and fighting natural disasters. We must be able to fight natural disasters while striving for bumper harvests.

In addition, it is necessary to actively develop forestry, animal husbandry, sideline production, and fishery. It is necessary to firmly grasp vegetable production in the suburbs of large and medium-sized cities. Rural enterprises must disseminate the experience of improving product quality, technology, and management; making high quality products; earning more foreign exchange; and raising economic results, so as to promote steady and healthy development. In order to guarantee the sustained growth of agricultural production we must reform and strengthen our service structure. It is necessary to do a good job of service before, during, and after agricultural production and exert effort to increase the production and supply of chemical fertilizer, insecticide, farm machinery, and other means of production. It is necessary to assign personnel to design new farm machines, finalize their design, and form complete sets of them. It is necessary to continue strengthening rural land management and resolutely curb the unhealthy trend of irresponsibly enclosing or using arable land.

2. Strive to develop the production of consumer goods

It is necessary to draw up a plan for increasing the production of famous brand, top quality products, marketable products, and high- and medium-grade products. It is necessary to do a good job of economic coordination. It is necessary to restrict the production of goods the supply of which exceeds demand and guarantee increased production of goods the supply of which falls short of demand. It is necessary to create new production categories and develop new varieties and products.

It is necessary to increase the rate of quality stability this year from 74 percent to more than 80 percent, so that the quality of 100 key products can reach or be close to advanced international levels and 500 products can reach advanced domestic levels. This year all enterprises directly under the counties and units above the county level must strive for production in accordance with standards. In order to need demand in the production of consumer goods, we must conserve and rationally use energy resources and raw and other materials and reserve the upturn in production costs. We must strive to improve existing enterprises' technology. This year we must firmly grasp the technical transformation of 100 most marketable products, 200 backbone enterprises, and 300 key projects; the digestion, absorption, and reproduction of 10 projects; and the tackling of key technical problems in 21 projects.

We have taken and are still taking measures to ease shortages in the power supply. We are striving to increase our power supply by 3.7 billion kwh by making our old generators generate electricity stably and at full capacity and our new generators generate more electricity earlier, subject to the prerequisite of safety and improvement in operation and construction. We must use electricity in a planned way and encourage people to conserve 600 million kwh of electricity. We must firmly grasp the above-mentioned measures to greatly develop the production of consumer goods and markedly raise our economic results in industry.

3. It is necessary to strictly control the scale of investment in fixed assets. Of the 825 million yuan investment for capital construction in state enterprises in Jiangsu this year, the portion of funds raised by the province is 10 percent less than last year, and of the 1,547 million yuan investment for technological transformation, 25 percent less. Although these decreases may create certain difficulties, we must consider the overall situation and ensure that we do not overspend. In strictly controlling investment scale, we must not only reduce the overall scale but must also rationally readjust the investment structure and step up efforts to liquidate unauthorized projects already under construction to guarantee key construction projects. Local budgetary investment should be used mainly on finishing up or continuing projects already under construction, while local extrabudgetary investment should be focused on the construction of energy, transportation, and raw and semifinished materials industrial infrastructure and on tertiary industry. As far as assistance to village and town enterprises is concerned, it is necessary to pay attention to their geographical distribution as well as local resources in determining the focal points and proper ratio of our investment.

4. It is necessary to strive to expand foreign trade and ensure market supply. We should strive to overfulfill the target of $1,532 million foreign exchange to be earned from Jiangsu's exports under the state plan this year. Currently, it is of crucial importance to ensure sufficient supply of marketable export commodities and guard against their diversion to the domestic market. To ensure steady supply of export goods, it is necessary to continue to give them priority in the supply of funds, raw and semifinished materials, and electric power. Vigorous efforts should be made to improve the quality of export commodities, increase their variety and design, and update them so that we can timely win a bigger international market with better and newer goods. While improving export commodity supply, it is necessary to map out an overall plan to ensure domestic market supply. Commerce departments should take active measures to formulate commodity purchasing and marketing plans

and improve the procurement and supply of manufactured consumer goods, especially those in short supply. They should also cooperate with industrial departments in coordinating production and consumption and striving to balance supply and demand. It is necessary to intensify the supervision over the procurement and supply of farm and subsidiary products to ensure the fulfillment of procurement and allocation plans for grain, cotton, and some other farm and subsidiary products having a vital bearing on the national economy and the people's livelihood. In order to improve supply, it is necessary to purchase or trade, by contract, meat, poultry, eggs, aquatic products, and vegetables, for which the fixed purchase system has been abolished. State-run commercial establishments should play the leading role in controlling the wholesale of goods in short supply by setting up a reserve system of major commodities and actively taking part in market regulation. At the same time, it is necessary to expand commercial facilities and outlets for enlivening circulation. It is necessary to reinforce market price supervision and strictly prohibit wanton price hikes or price rises in disguised form in order to effectively protect consumer interests.

5. It is necessary to improve financial and banking work and the allocation of funds and materials. Jiangsu faces a rather tough financial task this year, which must be fulfilled. The key to the fulfillment lies in expanding production and exploring new financial resources. At the same time, it is necessary to pay close attention to tax work and to collect taxes in full and in due time. It is also necessary to continue to make efforts to fulfill the state quota to reduce deficits and increase profits by focusing our attention on major deficit-ridden or profit-making units and on unprofitable products of profit-making enterprises. In view of the relatively difficult task in Jiangsu's financial revenues and expenditures this year, we should map out proper arrangement within the limits of our abilities and in line with the principle of giving overall consideration and ensuring priorities. Aside from expenses for technological transformation and price subsidies for meat, priority should be given to appropriately increasing investment in the development of intellectual resources and to agriculture expenditures, key construction projects, and retention of indispensable funds to combat natural disasters. It is necessary to reinforce financial and economic discipline and successfully complete the general checkup of financial and tax work. To assist production and construction units in raising funds, banking departments should explore new fund sources and increase savings deposits through various channels. It is also necessary to rationally utilize funds, readjust the structure of loans, improve management method, and raise the utilization rate of funds. Material supply departments should accelerate the delivery of materials, earnestly carry out warehouse inventory, pay close attention to conservation, and step up cooperation with other departments. They should also appropriately increase imports to replenish resources that Jiangsu needs.

6. Conscientiously reform the economic structure,

The principles of this year's economic structural reform are "Consolidation, assimilation, supplementation, and improvement," keeping the advantages and eliminating the disadvantages, and solving outstanding questions, so that reform can bring us greater benefits and we can fully prepare for the important new steps in reform during the next 2 years. This principle, when carried out, can help our economy grow steadily. It can also further deepen our reform. To implement this principle, we must firmly grasp the following: First, allow assimilation and supplementation of existing price and wage reforms, and solve persistent, outstanding questions. On price reform, the state has decided not to adopt further major measures this year. This is mainly to allow all sides to assimilate and improve the measures already carried out, to keep the general level of commodity prices basically stable. The upswing in the general level of Jiangsu's retail commodity prices this year must be kept within 5 percent. This will call for great efforts to stabilize the price of nonstaple foods, particularly vegetables, meat, and eggs. It is necessary to systematically solve long-standing questions concerning the price of industrial consumer goods. Prices of rolled steel, cement, and other principal means of production not under the state plan must be kept under proper control. It is necessary to straighten out collection of fees for tertiary industry and gradually readjust various charges in order of importance and urgency. Raising prices at will is not permitted. This year, it is necessary to solve outstanding unreasonable questions concerning reform of wage system in state organs and institutions. It is necessary to readjust and reform wage structure in enterprises according to the state's related regulations and plan. Second, further invigorate large and medium-sized enterprises. This year, the state will adopt the important measures of reducing regulatory tax and raising the depreciation rate. Departments concerned under the provincial government must, on the basis of investigation and study, draw up specific plan and submit it to the authorities for approval, and guarantee that the money is used properly. It is also necessary to continue to put various companies in order. The focal point of the work is to consolidate and reorganize companies of an administrative nature and those whose administrative responsibility is inseparable from their enterprise responsibility, and reduce the number of intermediate levels. Inside an enterprise, it is necessary to lay emphasis on consolidating and improving various economic responsibility systems, properly assign lower-level units to be accounting units, practice management at different levels, and correctly handle the relationship between control and decontrol, between undertaking one production task and the diversified economy, and between production and auxiliary workshops. It is necessary to raise an enterprise's ability to transform and develop through internal and external reforms. Third, promote lateral economic integration. We must make great efforts to promote lateral economic ties among enterprises and continue to develop them among prefectures, based on the principles of voluntary participation, fostering strengths and circumventing weaknesses, adopting a variety of forms, mutual benefits and simultaneous development. We must gradually establish a new form of enterprise structure, characterized by integration of urban and rural areas, well-proportioned development of big, medium, and small enterprises, a close combination of production, scientific research, and circulation of commodities, and rational use of productive forces, to promote development of the province's economy for specialization and modernization. Through grasping economic integration and promoting reforms, we must discover and resolve, in a timely manner, those problems existing in our present systems, regulations, and rules which hamper economic integration, so that our work of economic structural reform will be further promoted. Fourth, we must correctly carry out various experimental reforms. Regarding the experimental work in Changzhou and Zhenjiang cities on the establishment of markets for means of production, reform of the banking system, commercialization of living quarters, and organizational reform, it is imperative to conduct investigation and study, map out plans, and strengthen leadership to see that the work is earnestly carried out.

As far as science, education, culture, public health, and physical culture are concerned, we should successfully carry out the reform and work in all fields this year in line with the demands set in the Seventh 5-Year Plan.

The intensification of ideological and political work and stress on building a socialist spiritual civilization are important guarantees for fulfilling the tasks of this year. Currently, it is necessary to pay particular attention to studying and publicizing the guidelines of the Fourth Session of the Sixth NPC and Premier Zhao Ziyang's report on the Seventh 5-Year Plan, regarding them as essential contents of the ideological and political work. Through study and publicity, it is necessary to make the broad masses of cadres and people have a better assessment of the situation, achieve greater unity in thinking, and understand the tasks more clearly, thereby inspiring their fighting spirit, enthusiasm, and dedication to build socialism. In order to further improve general social conduct, all trades and professions in Jiangsu should launch extensive and in-depth activities to cultivate, learn from, and catch up with advanced models, encourage socialist justice, and oppose and resist all sorts of unhealthy trends.

Fellow deputies:

In retrospect, implementation of the Sixth 5-Year Plan shows that under the correct leadership of the Party Central Committee and the State Council, Jiangsu's economy developed along a new road at a more reliable pace, with better efficiency, and more benefits to the people. As a result of practice and exploration over the last few years, a new socialist economic system full of vigor and vitality is now taking shape; economic and social development is becoming more harmonious; and a bright future for socialist modernization is emerging. Looking at the prospects of the Seventh 5-Year Plan, we shall continue to advance along the correct course chartered by the Party Central Committee. Inspired by the guidelines of the National Conference of Party Delegates and the Fourth Session of the Sixth NPC, the people of the whole province have gone all out to carry out the four modernizations program. The Seventh 5-Year Plan of Jiangsu, after it is approved by the current session, will give the people throughout the province a clearer fighting goal for the near future. We are convinced that as long as we continue to implement the party's principles and policies in the light of actual conditions in Jiangsu; carry out the current work with our long-range development in mind; build socialism in both its material and spiritual aspects; and struggle in unity to realize the splendid plan, the socialist undertaking in Jiangsu will advance with each passing day, our Seventh 5-Year Plan will certainly be fulfilled, and Jiangsu's economy will surely prosper!

ECONOMIC PLANNING

SHANXI PLANNING, FINANCE CHIEFS REPORT ON WORK

HK090117 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 8 May 86

[Excerpts] The fourth session of the Sixth Provincial People's Congress held its second full gathering on 8 May to listen to a report by (Wu Jinzhou), director of the provincial planning commission, on the draft plan for economic and social development in 1986, and a report by (Yan Yuansuo), director of the provincial finance department, on the final accounts for 1985 and the draft budget for 1986.

(Wu Jinzhou) said: The draft plan calls for total social output value this year to rise by 8 percent over 1985, national income to increase by 8.2 percent, and agricultural and industrial output value to rise respectively by 4 percent and 7.9 percent.

(Wu Jinzhou) stressed: We must vigorously promote agricultural diversification this year, under the premise of ensuring a steady increase in grain output, so as to invigorate the rural economy. In industry, we must maintain an appropriate growth rate on the basis of improving product quality and economic results. We must strictly control investment in fixed assets, and improve the structure and results of investment. At the same time we must do a good job of arranging supplies of best-selling products for the markets, further enliven the markets, and ensure basic price stability. We should also further expand external exchanges.

(Yan Yuansuo) said in his report: The growth of industrial production in Shanxi last year was relatively sound, and there was a synchronous rise in output value, sales, income, and profit and tax delivery. Despite serious natural disasters, the province achieved the third best harvest since the founding of the state.

He said: The main principle in arranging this year's budget is to correctly bring into play the functional role of finance and maintain steady growth in revenue on the basis of promoting the development of production and improvement in economic results.

SHANGHAI PORT PLACED UNDER 'DUAL LEADERSHIP'

OW090557 Beijing XINHUA Domestic Service in Chinese 1414 GMT 8 May 86

[By reporter Feng Yizhen]

[Text] Shanghai, 8 May (XINHUA)--Beginning this year, Shanghai Port, the largest seaport in China, will be placed under a system of dual leadership--leadership by the Ministry of Communications and by the Shanghai Municipal Government--especially under the leadership of the Shanghai Municipal Government. A ceremony to change leadership was held in Shanghai today.

At the request of a leading comrade of the State Council, Zhao Weichen, deputy head of the State Council's leading group in charge of sea, land and air ports, presided over today's ceremony. Qian Yongchang, minister of communications, and Jiang Zemin, mayor of Shanghai, signed and exchanged the texts of the Protocol on the Change in the Administrative System of Shanghai Port.

Shanghai is one of the 10 largest seaports of the world, each handling over 100 million metric tons of cargo annually. It is also China's largest seaport handling domestic and foreign trade and an important center for river and sea transportation. Reforming the administrative system of Shanghai Port is an important decision of the central authorities. It serves as a major step in restructuring communications and transportation administration, as well as an important part of the project to restructure the entire economic system. The reform is aimed at giving Shanghai port greater decisionmaking powers to further revitalize its operation as an old seaport and to better serve production, foreign trade, and all provinces and municipalities along the Chang Jiang as well as various other parts of the country.

Following the reform, the Shanghai Port fiscal policy will be that of "supporting itself with its own resources." It will also expedite the reconstruction of the old port zone and the construction of a new port zone. Under Shanghai's general development plan, it will also intensify efforts to complete the various preliminary projects in developing the new port zone in order to solve once and for all the problem of port capacity not keeping up with objective needs.

After the ceremony, the Shanghai Harbor Administration of the Ministry of Communications was renamed "Shanghai Port Bureau," and the "Shanghai Bureau for the Supervision of Sea Security` of the Ministry of Communications" was established.

JIANGSU'S GU XIULIAN ATTENDS INDUSTRIAL MEETING

OW071235 Nanjing Jiangsu Provincial Service in Mandarin 2200 GMT 6 May 86

[Excerpts] The Ministry of Electronics Industry and the Jiangsu Provincial Government held a meeting on 6 May in Nanjing on placing some enterprises originally run by the ministry under the authority of the City of Nanjing. It was announced at the meeting that a total of seven enterprises originally run by the Ministry of Electronics will be placed under the authority of the City of Nanjing. The seven enterprises are: the Nanjing radio factory, the Changjiang machinery plant, the Nanjing telecommunications equipment plant, the Huadong electron tubes factory, the Xinlian machinery plant, and the Jinling radio equipment plant. They are large and medium-sized enterprises with fairly high technical standards and a solid foundation. They constitute the main force of Jiangsu's electronics industry.

In a joint circular, the Ministry of Electronics and the Jiangsu Provincial Government pointed out: With the transfer of the seven enterprises to Nanjing, the original pay scales and grades of the workers and staff will remain unchanged. The relevant departments and the City of Nanjing should delegate the necessary decision-making powers to the enterprises, and the enterprises should do a good job in establishing lateral economic and technical ties with other departments, areas, and trades on the basis of the principle of voluntary participation and mutual benefit and in effecting coordination with specialized departments.

(Qian Ming), deputy director of the Office of Industrial Streamlining Program for Inland Provinces under the State Council; Liu Jianfeng, vice minister of electronics; Gu Xiulian, governor of Jiangsu; and Zhang Yaohua, mayor of Nanjing, attended the meeting and made speeches.

JILIN AUTO ENTERPRISES JOIN CHANGCHUN ASSOCIATION

SK180320 Changchun Jilin Provincial Service in Mandarin 0930 GMT 15 May 86

[Text] Four local auto industrial enterprises in our province joined the auto industrial association of the No 1 motor vehicle plant.

Today, the auditorium of the guest house under the Changchun No 1 Motor Vehicle Plant was permeated with a joyful atmosphere. The Jilin City Auto Industrial General Company, the Changchun City Dongfeng Motor Vehicle Manufacturing Plant, the Changchun City Motor Vehicle Engine Plant, and the Changchun City Motor Vehicle Gear Plant joined the auto industrial association, which takes the Changchun No 1 Motor Vehicle Plant as the main body, and in which the economic cooperative system is being implemented. The joint agreement-signing ceremony was held at 1400. Responsible persons of the four enterprises joining the auto industrial association of the Changchun No 1 Motor Vehicle Plant, the chief of the Changchun No 1 Motor Vehicle Plant, the manager of the Changchun Motor Vehicle Industrial Company, and the mayors of Changchun and Jilin cities signed the agreements.

In his speech, (Geng Zhaojie), chief of the Changchun No 1 Motor Vehicle Plant, pointed out: The practice of the four enterprises in Jilin and Changchun cities in joining the auto industrial association of the Changchun No 1 Motor Vehicle Plant has provided us a very successful example. We should sum up and promote experiences gained in this regard and further consolidate and develop joint businesses.

Governor Cao Dezhan gave a speech at the signing ceremony. He said:

[Begin recording] The auto industry is our province's first major support industry and the most important industry among other heavy industries. A failure in grasping the auto industry in the course of grasping the economy of Jilin Province means a failure in grasping the economy itself. The Changchun No 1 Motor Vehicle Plant is the country's key motor vehicle producing enterprise. Its development, whether rapid or slow, has a vital bearing on the country's key construction projects and exerts a great influence on our province's economic development. In order to develop motor vehicle production, the

Changchun No 1 Motor Vehicle Plant has done much to develop lateral economic cooperation. Our province has also done much to organize lateral cooperation and set up support facilities for the No 1 Motor Vehicle Plant, and has a fairly good foundation in this regard. In order to establish further cooperation and to develop the auto industry, we called, last year, for efforts to establish cooperation between the army and the people and among all the people throughout the province. However, such cooperation is just a loosely-organized cooperation or a form of joint ventures. At present, on the basis of the original foundation, we should unceasingly deepen the cooperative work and march towards a higher level of cooperation along with the development of the current situation. This new type of economic cooperation has a pioneering nature. The cooperation has the following characteristics:

1. This is a practical and close cooperation different from other kinds of general cooperation. It is neither a loosely-organized cooperation nor a jointly-financed and cooperative operation. It is a change of subordinate relationships among the four enterprises in Changchun and Jilin Cities. The production, supply, sales, personnel, financial and material resources as well as the plans and channels of the four enterprises will be transferred to the No 1 Motor Vehicle Plant and be under its unified leadership, planning, management and operation.

2. This cooperation is really an economic cooperation of mutual benefit. It differs from the general amalgamation of plants or the taking over of enterprises. The four enterprises joining the auto industrial association of the Changchun No 1 Motor Vehicle Plant will have a relatively independent nature and the status of being a legal person. They will implement the independent accounting system in management.

3. It is a realistic enterprise-like economic cooperation. Enterprises joining the association will change their subordinate relationships and will be under the leadership of large key enterprises such as the Changchun No 1 Motor Vehicle Plant. Breaking the barriers between departments and regions will be conducive to separating the functions of the government from those of enterprises and adhering to the correct orientation of reforms. Through this cooperation, we will greatly promote the province's lateral cooperation. Our general demands for this work are to unify thinking, to have a vigorous attitude, to accelerate the pace, to do steady and reliable work, and to yield actual results. [end recording]

(Wang Jiatong), acting mayor of Changchun City, Wu Cuangcai, mayor of Jilin City, and (Cai Shiting), deputy manager of the (?China Motor Vehicle Company) also gave speeches at the signing ceremony.

XINJIANG TO PUT MORE GOODS UNDER MARKET REGULATION

HK141530 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 12 May 86

[Roundup: "Develop Lateral Economic Ties, Enliven Goods Circulation"]

[Excerpts] Over the past few years, the state has reformed goods supply methods, reduced the types and proportions of goods distributed by the state in a unified way, and put more goods under market regulation. According to statistics, the types of goods distributed by the state in a unified way have reduced from 465 to 23. Of all the goods distributed to the region by the state in the past, 35 percent have now been put under market regulation. Therefore, catering to the market, developing lateral ties in goods circulation, and enlivening goods supply are very important new problems which goods supply departments at all levels now face.

Over the past two years, goods supply departments in the region have done a lot of work developing lateral ties and strengthened the role of market regulation in goods supply, achieving some results.

We must earnestly sum up and study the new situation and new problems in markets; further break the barriers between areas, departments, and trades; attract extensive commercial, foreign trade, goods supply units and production enterprises to take part in the purchase and sale activities of trading centers so that they can coordinate goods supply, jointly exploit natural resources; and reasonably readjust goods circulation.

In short, provided that we act upon objective economic laws, base ourselves upon the market, cater to society, and extensively develop lateral ties in circulating goods, we can definitely enliven goods circulation in the region and ensure the supply of goods needed in the various economic constructions in the region.

GANSU CPC, GOVERNMENT VIEW URBAN ECONOMIC REFORM

HK051352 Lanzhou GANSU RIBAO in Chinese 22 Apr 86 p 1

[Report: "Provincial CPC Committee and Government Put Forward Opinions on Arrangements for This Year's Urban Economic Structural Reform"--capitalized passages published in boldface]

[Text] Recently, the provincial CPC committee and provincial government put forward "opinions on arrangements for urban economic structural reform in 1986," urging various localities throughout the province to do well in "consolidating, digesting, supplementing, and improving" on the basis of reform over the past 2 years, to continue to grasp the key link of invigorating the enterprises, to place emphasis on enlivening large and medium-sized enterprises, to expand lateral economic ties, and to create conditions for further deepening reform to promote sustained, stable, and coordinated economic development of the whole province.

The opinions on arrangements put forward by the provincial CPC committee and provincial government cover the following six aspects:

1. WE SHOULD EXERT GREAT EFFORTS TO REINVIGORATE ENTERPRISES, LARGE AND MEDIUM-SIZED ENTERPRISES IN PARTICULAR. We should truly deepen comprehensive reform inside enterprises. Instead of depending upon external assistance and asking the higher authorities for power, our policy should be based on the efforts of enterprises. Enterprises should do well in their internal reform and in tapping their own potentials. Instead of carrying out unitary reform, they should shift their efforts to carry out comprehensive and systematic reform and enliven their various "cells." Instead of paying attention only to their short-term results and the immediate interests of workers and staff members, enterprises should pay more attention to their long-term interests and strengthen their staying power. Instead of locking their doors against the outside world, they should implement an open policy. Instead of imitating others, they should proceed from actual conditions and select their own breakthrough points for reform. 1) They should further improve responsibility system of factory directors (managers), and pursue an administrative and responsibility system covering targets during the term of service of factory directors (managers). 2) They should carry out administration by different levels and delegate power, and rationally define small accounting units. 3) They should improve internal distribution systems, further overcome the practice of "eating from the same big pot," and closely link responsibility, power, and interests. 4) Reform of enterprises should be closely integrated

with business management and technical reform. In the meantime, good external conditions and environment should be created in various aspects in order to reinvigorate enterprises.

2. WE SHOULD TAKE A BIG STEP IN EXPANDING LATERAL ECONOMIC TIES. We should fulfill or overfulfill the targets set in the 3-year plan of the province concerning the expansion of product manufacturing, further develop various transregional and transdepartmental production factors, and cooperation in various fields, and improve multichannel, multilayered, and multiform ties. We should follow a down-to-earth manner to help enterprises solve their practical problem of expanding lateral economic ties, and straighten out various relations. The province will continue to implement a policy of giving preferential treatment to, and supporting, enterprises that expand their lateral economic ties.

3. WE SHOULD OPEN UP VARIOUS KINDS OF MARKETS AND ENLIVEN CIRCULATION. We should continue to expand the consumer goods market and improve the market of agricultural goods in both urban and rural areas. In localities in which conditions exist, efforts should be exerted to gradually establish well the technology market, labor affairs market, transport market, building construction market, and housing market, with emphasis on the experiment in the reform of the market of means of production and capital market. We should also do well in commercial reform in towns and cities.

4. WE SHOULD CONTINUE TO IMPROVE THE PRICE SYSTEM AND DO WELL IN WAGE REFORM. With regard to price reform, we should adopt a prudent policy. Our emphasis should be placed on improving measures of reform, which have been adopted, so that various quarters will gradually conform with the new situation. Price reform of the means of production should be beneficial to stabilizing prices of goods required by key construction projects, and industrial consumer goods. Regarding the prices of industrial goods needed by people in their daily life, we should adopt the methods of reducing production costs and consumption, enhancing economic results, and promoting self-digestion [zi wo xiao hua 5261 2053 3194 0553] to overcome the factors of price increase. We should continue to carry out wage reform. To gradually straighten out wage relations, we should appropriately carry out experiments in comprehensive reform of our labor system, insurance system, labor protection system, and staff training system.

5. WE SHOULD ACTIVELY PROMOTE THE EXPERIMENTS IN SOME SELECTED CITIES IN CARRYING OUT COMPREHENSIVE REFORM TO GIVE PLAY TO VARIOUS FUNCTIONS OF CITIES, AND ADVANCE THE DEVELOPMENT OF PLANNED COMMODITY ECONOMY. According to our province's existing arrangements, we should actively promote the experiments in comprehensive reform in Lanzhou, Tianshui, Baiyin, and Wuwei, and take positive measures to make exploration aimed at preeminent reform. We should also provide experience in improving measures for reform.

6. WE SHOULD CONTINUE TO STREAMLINE ADMINISTRATION AND DELEGATE POWER, CHANGE THE FUNCTIONS OF GOVERNMENT DEPARTMENTS, AND IMPROVE MACROSCOPIC CONTROL. Economic administrative departments of the government should continue to streamline administration and delegate power; do well in reform in terms of guiding thinking, work style, organization, and system; and their functions should be gradually shifted to planning, coordination, supervision, and service. We should strengthen management of enterprises and exercise indirect control over them. In accordance with the principle of separating the function and responsibility of government from those of enterprises, we should continue to create conditions to transfer enterprises formerly owned by the government to the lower level to actively promote the establishment of the indirect management system. To make preparations for carrying out structural reform and streamlining administration in the future, the relevant departments should continue to do well in conducting investigations and studies.

In the opinions on arrangements, the provincial CPC committee and provincial government finally urge the departments concerned to strengthen leadership, vigorously promote coordination, cooperate with each other closely, and do their work in a down-to-earth manner to constantly promote the reform of the economic system.

SOUTHERN XINJIANG HOLDS FORUM ON GETTING RICH

HK150701 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 13 May 86

[Excerpts] Between 5 and 11 May, the three prefectures and autonomous prefecture in southern Xinjiang held a forum in Kashi on eradicating poverty and getting rich. The forum urged all cadres and masses of the three prefectures and autonomous prefecture to unite in striving for achieving the goal of eradicating poverty and getting rich.

Wang Enmao, vice chairman of the national CPPCC and chairman of the regional advisory committee; Song Hanliang, Tomur Dawamat, Janabil, and other leading comrades of the regional party, government, military, and the production-construction corps; responsible comrades at the prefectural, autonomous prefectural, county, and city levels of Kashi, Kizilsu, and Hotan prefectures and autonomous prefecture; as well as responsible comrades of the region's relevant departments, committees, offices, and bureaus, attended the forum.

Also present were leading comrades of the State Nationalities Affairs Commission and the Ministry of Water Resources and Electric Power, as well as leaders and experts of the scientific investigation team under the Chinese Academy of Science.

Focusing on the issue of helping southern Xinjiang promptly eradicate poverty and get rich, the forum held a comprehensive and lively discussion.

There is now wide gap between the living standards of the people living in the three prefectures and autonomous prefecture and the average level of the region's living standard.

The participating comrades held: Though southern Xinjiang faces problems in the areas of developing the economic and other undertakings, the area still has many favorable conditions. Provided that we make full use of them, we shall certainly achieve the goal of getting rich and invigorating the economy of southern Xinjiang.

On the base of seeking and heightening common understanding, the forum decided that we should do well in the following tasks in the course of casting away poverty and getting rich:

First, we must educate the cadres and masses on establishing the thinking of self-reliance and struggling hard. We must take it as the guiding ideology for the work of eradicating poverty and getting rich.

Second, we must give play to the advantages of various places, and readjust well the production structure.

Third, we must unremittingly tackle the work of farmland capital construction, which focuses on water conservancy, and constantly improve the production conditions as well as the environment for production.

Fourth, depending on the advancements of science and technology, we must take the road of economization. Poor areas must use science and technology to end the situation of reaping small harvests despite comprehensive cultivation, and having poor economic results. They should also abandon the method of raising livestock by simply depending on the weather.

Fifth, we must greatly develop town and township enterprises, which should be based on the industry of processing farming tools. In connection with this, we should also develop such service industries as packaging, storage, transport, and marketing. We should also develop tertiary industry.

At the closing session, Wang Enmao, Song Hanliang, Tomur Dawamat, Janabil, and other leading comrades made speeches. In their speeches they urged the cadres and masses of southern Xinjiang to be united, to enhance their revolutionary vigor, to struggle hard, and to strive to get rich during the Seventh 5-Year Plan period.

BRIEFS

HENAN ECONOMIC ISSUES--On 10 May, the provincial government summoned responsible comrades of prefectures and cities to discuss current economic work. Governor He Zhukang and vice governors Zhang Zhigang, Qin Kecai, Hu Tingji, Hu Tiyun, Liu Yujie, and Zhao Zhengfu attend. He Zhukang called on everyone to take an all-round and systematic view of the province's economic situation. Generally speaking this situation is very good, but there are also certain difficult problems, mainly in the following respects: 1) The state of industrial production is not good enough; 2) in rural work there are problems of ineffective information, failure of readjustment measures and comprehensive services to keep abreast of needs, and [words indistinct]. At present, while continuing to get a good grasp of rural work, we must grasp industrial production as an important task. All areas and departments must brace their spirits, persevere in reform, and get rid of slackness and fear of difficulties. We must get a good grasp of management and consolidate the fruits of reform. [Excerpts] [Zhengzhou Henan Provincial Service in Mandarin 2200 GMT 13 May 86] /8309

XIZANG REGIONAL TAXATION WORK CONFERENCE ENDS

HK141231 Lhasa Xizang Regional Service in Mandarin 1130 GMT 10 May 86

[Text] The regional taxation work conference concluded in Lhasa on 9 May. This conference was the largest of its kind since the peaceful liberation of Xizang. The main subjects of the conference were to implement the spirit of the enlarged meeting of the Standing Committee of the regional CPC committee, further correct people's guiding thought on taxation work, sum up the experiences in taxation work over the past few years, revise and formulate policies and regulations on taxation work, and arrange taxation work for 1986. Through the conference, taxation personnel in the region have deepened their understanding of the role and position of taxation work in the region's economic construction.

Puquin, vice chairman of the regional people's government, briefed the conference on the political and economic situation in the region and highly valued the region's taxation work over the past few years. He demanded that all taxation personnel further eliminate leftist influence, correctly understand and bring into full play the role of taxation work as an economic lever, and reasonably readjust the region's taxation policies, so as to meet the region's real situation and serve the purpose of peasants and herdsmen getting rid of poverty and becoming better off.

The vice chairman expressed the hope that governments at all levels will strengthen their leadership over taxation work and support the work done by taxation departments. The participants earnestly discussed Puquin's speech and raised valuable suggestions on concrete methods and policies for improving taxation work.

The conference commended advanced collectives and individuals in the region's taxation field. A proposal written by the advanced collectives and individuals to all comrades on the region's taxation front was read at the conference.

FINANCE AND BANKING

BRIEFS

QINGHAI ENTERPRISES' CAPITAL NEEDS--The province's financial sector has worked hard to improve macroeconomic control and to make the best use of funds, and has solved the enterprises' normal and reasonable capital needs in a down-to-earth manner and in order of importance and urgency. Compared to the same period last year, industrial loans granted in the first quarter this year increased by 76.8 percent, thereby promoting industrial development. In the first quarter this year, the province's contradiction between demand and supply of capital was rather prominent. In order to meet the enterprises' normal and reasonable capital needs, various banks appropriately granted loans while strengthening macroeconomic control, thereby basically ensuring the funds for the enterprises' normal production and circulation. By the end of the first quarter, loans granted by banks increased by some 147 million yuan compared to the figure at the beginning of this year. This included an increase of 99 million yuan in industrial loans and construction enterprises' circulation fund loans compared to that at the beginning of this year. According to the statistics of the provincial industrial and commercial bank, for steel, cement and coal industrial enterprises alone, the bank increased the amount of loans by 75 million yuan for importing raw materials. NORTHEAST CHINA EXPORTS POWER PLANT EQUIPMENT

OW291229 Beijing XINHUA Domestic Service in Chinese 0112 GMT 28 Apr 86

[Excerpts] Harbin, 28 Apr (XINHUA)--An electrical machinery economic and technical group from northeast China, which was formed through eliminating contradictions between higher and lower levels and between departments and regions, has consolidated the superiority of individual products of various enterprises into that of complete sets of equipment, forming China's first enterprise group for exporting large power plant equipment.

In 1983, 38 enterprises, most located in northeast China, freed themselves from restrictions imposed by different departments and regions to jointly set up the Harbin Complete Power Plant Equipment Company, a northeast China electrical machinery economic and technical group aimed at supplying complete sets of power plant equipment. The company contracts to supply equipment for thermal, hydroelectric, and nuclear power plants in China and in foreign countries, and then subcontracts production work to enterprises under it. By doing so, it is able to provide a package service to customers, which includes electrical engineering design; equipment manufacturing, supply, and installation; ground work for power plants; and other technical matters, thereby doing away with various malpractices which had long existed. Currently, the company can produce more than 90 percent of the power plant equipment it contracts to supply.

In 1983, the company was awarded a contract to supply (Kudu) Power Station in Pakistan with 210,000-kilowatt power plant equipment, enabling China to export large power plant equipment for the first time. The power station was put into operation ahead of schedule in early February, winning a good reputation for China's power plant equipment on the international market. Currently, the company is bidding for projects at the (Jamushiaoro) Power Station in Pakistan, the (Katlan) Power Station in Turkey, and power stations in Bangladesh and Iraq, striving to expand the international market for China's power equipment.

The company also organized enterprises under it to actively expand their capability to produce nuclear power plant equipment. After undergoing a short-term technical renovation, the company will be able to produce nuclear power plant equipment amounting to 1 million kilowatts annually.

FOREIGN TRADE AND INVESTMENT

YUNNAN INCREASES FOREIGN EXCHANGE EARNINGS

HK021344 Kunming YUNNAN RIBAO in Chinese 19 Apr 86 p 1

[Report by Lu Jianhua [7120 1696 5478]: "Our Province's Foreign Exchange Earnings From Exports Last Year Exceeded $120 Million"]

[Text] According to reports from the provincial Economic and Trade Department, the foreign trade departments in our province have, through energetically carrying out reforms, basically put an end to the situation in the past few years in which the foreign exchange earned from exports fluctuated around $100 million. Last year, the foreign exchange earned from exports was $129 million, which was 140.8 percent of the state plan for our province and 15.8 percent over the previous year.

According to reports, of the nearly 300 kinds of export commodities of the province, 24 earned over $1 million each. They included buckwheat, beans, bamboo shoots in salt water, cotton yarn, textiles, garments, black tea, puer tea, walnut kernels, dried peppers, geranium oil, rosin, cured tobacco, pseudoginseng, bark of fagus longipetiolata, work gloves, tin, antimony, machine tools, yellow phosphorus, calcium, magnesium, and phosphorus fertilizers, and so on. Foreign exchange earned by exported tobacco (including cured tobacco and cigarettes), tin (including refined tin and soldering tin), and tea (including black tea and puer tea) was $72.02 million, accounting for 56 percent of the total foreign exchange earned by the province from exports.

There are three main reasons why the foreign trade departments in our province could attain such relatively great achievements last year:

--The foreign trade departments energetically carried out reforms, completely removed the restrictions of the circulation structure in procuring export commodities that had only "one plan, one channel, and one price." They directly participated in market regulation. Last year, in accordance with actual situations and through making calculations, the provincial tea import and export company fixed competitive prices, correctly made use of economic levers, and participated in market regulation. In March last year, in view of the price rise of raw materials for tea factories, the company raised the average producer price of export tea by 7.13 percent on the basis of the contract price. Last year, this company exported more than 5,500 tons of tea, reaching an all time high. The sum of commodities directly procured from the market for export by foreign trade departments of prefectures and counties throughout the province accounted for about 40 percent of the total procurement value.

--Foreign trade enterprises universally implemented the economic responsibility system and the post responsibility system, thus putting an end to the practice of "eating out of the same big pot" in enterprises and among the workers and other employees, and arousing the enthusiasm of workers and other employees. The Qujing prefectural company and most county (city) companies established one after another the contracted economic responsibilities system last year and their annual procurement value reached over 21 million yuan, an increase by a big margin over that of the previous year.

--Foreign trade departments at all levels paid attention to building export commodity bases and special factories (mines) in their vigorous efforts to boost export commodity production. Some of them energetically provided information, helped develop new products, made great efforts to promote sales of products of enterprises, and peasants and others provided financial, material, and technological support.

XIAMEN JOINT VENTURES LACK SUFFICIENT INVESTMENT

HK050809 Beijing ZHONGGUO XINWEN SHE in Chinese 0222 GMT 3 May 86

[Report by reporter Zhuang Nuo [8369 6169]: "Some Xiamen Joint Venture Enterprises Lack Sufficient Investment"]

[Text] Xiamen, 3 May (ZHONGGUO XINWEN SHE)--In some of the Chinese and foreign joint venture enterprises in the Xiamen Special Zone, the capital actually paid is much less than that registered; this has already roused the attention of the relevant departments.

According to a recent survey of 94 Chinese and foreign joint venture enterprises by the Xiamen City Auditing Administration, the registered capital of these enterprises totals 1,015 million yuan, but their actually paid capital is only 445 odd million yuan. Both the Chinese and foreign parties to the joint ventures have only paid on average of 44 percent of the capital that they have undertaken to pay. The enterprises of joint investment under the investigation include those engaged in industry, commerce, real estate, construction and decoration, tourism, transport, animal breeding, and service trade. The lack of paid capital has to some extent affected the turnover of funds in these enterprises.

The survey has also discovered that the 130 enterprises of Chinese-foreign joint and cooperative venture, only 19 have had their capital audited, while 111, or 85 percent, of the enterprises have not had their capital audited. Without the auditing of capital by certified Chinese accountants, we will not be able to effectively supervise the various parties concerned and urge them to pay the capital in a timely manner.

The Xiamen Auditing Administration has also found through the survey that 82 Chinese-foreign joint venture enterprises have violated the regulations concerning the accounting system of Chinese-foreign joint ventures. Their accounting statements for last year show that they failed to assign accounting firms to audit their accounts before they distributed their profits. The relevant department pointed out that these problems that had not cropped up in our Chinese-foreign joint ventures are detrimental to the development of these joint ventures.

SPECIAL ECONOMIC ZONES

SHENZHEN FEDERATION OF INDUSTRY, COMMERCE SET UP

HK290801 Beijing ZHONGGUO XINWEN SHE in Chinese 1448 GMT 28 Apr 86

["Li Hao Says the Shenzhen Federation of Industry and Commerce Will Become a Link Between the Mainland and Traveling Businessmen"--ZHONGGUO XINWEN SHE headline]

[Text] Shenzhen, 28 Apr (ZHONGGUO XINWEN SHE)--At the inauguration ceremony of the Shenzhen Federation of Industry and Commerce today, Shenzhen Mayor Li Hao said that the Shenzhen Federation of Industry and Commerce will become an influential mass organization in Shenzhen and a link between the mainland and compatriots residing abroad, as well as industrialists and businessmen in Hong Kong, Macao, and Taiwan.

Of all the federations of industry and commerce in various parts of China, the Shenzhen Federation of Industry and Commerce has the largest number of investors. Eighty-three of its 120-odd members are Hong Kong businessmen or overseas Chinese investors; 3 of its 6 vice presidents are Hong Kong businessmen. Henry Fok, president of the Hong Kong General Chamber of Commerce, and over 100 Hong Kong businessmen attended the inauguration meeting of the Shenzhen Federation of Industry and Commerce.

Li Hao said: It is hoped that after its founding the Shenzhen Federation of Industry and Commerce will extensively contact friends in the industrial and commercial circles in Hong Kong, Macao, and Taiwan and among overseas Chinese, as well as foreign industrialists and businessmen, understand and reflect their views, help the relevant authorities develop cooperation with them, run enterprises well, and gradually carry out consultant services, such as training personnel for industrial and commercial enterprises and providing industrial and commercial information.

Shao Junyan, president of the Shenzhen Federation of Industry and Commerce, said that in the future the federation will recruit a large number of industrialists and businessmen from Hong Kong, Macao, and Taiwan and among overseas Chinese who invest in Shenzhen, as well as Shenzhen industrialists and businessmen now residing in Hong Kong, Macao, and Taiwan.

It is reported that there are now more than 3,000 enterprises wholly financed by businessmen from outside the country and Chinese-foreign joint ventures and cooperative enterprises.

HEILONGJIANG MODEL WORKERS MEETING HELD

SK300927 Harbin Heilongjiang Provincial Service in Mandarin 1000 GMT 29 Apr 86

[Report on opening of the provincial model workers representative meeting held in Harbin on 29 April--with portions recorded]

[Excerpts] This afternoon, the Sixth Heilongjiang Provincial model workers representative meeting was ceremoniously held in Harbin City. This afternoon, the Harbin Worker's Cultural Palace was colorfully decorated for the festival. Several hundreds of youths and children, holding flowers and colored streamers in their hands, sang and danced to welcome the model workers representatives who came to attend the meeting. Greeting the model workers representatives outside the meeting hall were leaders of the provincial CPC committee, the provincial People's Congress, the provincial government, and the provincial CPPCC committee, including Chen Yunlin, Zhang Xiangling, Lu Guang, Liu Zhongli, and Bao Zong. They warmly shook hands with the model workers representatives. With the approval of the provincial government, 1,194 people were named model workers of the province, 52 units advanced enterprises, and 196 units advanced collectives. The last provincial model workers representative meeting was held in May 1980.

The meeting was formally opened at 1500. Hou Jie, deputy secretary of the provincial CPC committee and governor, presided over the meeting.

After listening to a congratulatory message given by the young pioneers, Wang Jun, vice chairman of the provincial People's Congress Standing Committee, announced the decision of the provincial People's Congress Standing Committee on naming the provincial special-grade model workers. Du Xianzhong, secretary general of the provincial government, announced the decision of the provincial government on naming the provincial model workers, and the provincial advanced enterprises and collectives. Chen Youyi, director of the provincial Trade Union Council, announced the namelist of winners of the province's 1 May labor medals on behalf of the All-China Federation of Trade Unions. Sun Weiben, secretary of the provincial CPC Committee, said: [Begin Sun Weiben recording]

All representatives: You are the meritorious workers in the four modernizations from all fronts throughout the province, as well as the examples for emulation by the broad masses of people. First of all, let me extend high respects to you and warm regards to the broad masses of workers on all fronts and the working people throughout the province on behalf of the Heilongjiang Provincial CPC Committee and the Heilongjiang Municipal People's Government. [end recording]

In his speech, Sun Weiben reviewed the province's political and economic situations and highly praised the model workers for their outstanding contributions to the two civilizations. Sun Weiben said: The recent Fourth Session of the Sixth NPC discussed and adopted our country's Seventh 5-Year Plan. Comprehensively fulfilling the Seventh 5-Year Plan is a heavy task entrusted to us by the era. Sun Weiben called on the broad masses of workers to contribute to realizing the Seventh 5-Year Plan. He said:

[Begin recording] The provincial CPC Committee and government hope that all model workers and advanced collectives will unite as one, and lead the broad masses of workers and staff members from all fronts in actively responding to the call of the party, the state and the province, and will actively go into action to extensively carry out the socialist labor emulation drive and to offer plans and exert efforts to fulfill the Seventh 5-Year Plan and to make contributions.

First, it is necessary to deeply study and implement the guidelines of the Fourth Session of the Sixth NPC. Leaders at all levels and model workers should lead the broad masses of workers and staff in conscientiously studying and deeply understanding the essence of the document guidelines, and should enhance understanding, reinforce confidence, boost fighting will, and clearly define the tasks. Furthermore, leaders and model workers should also integrate the development and construction plans of their own units and localities with their own work in an effort to fulfill or overfulfill their production tasks. Through enhancing their initiative in reform and construction, they should strive to eliminate blind actions, and to create a new situation in fulfilling the Seventh 5-Year Plan.

Second, it is necessary to care for and support reforms, and stand in the vanguard of reform. All our achievements scored in the Sixth 5-Year Plan period fundamentally came from reforms. The key to fulfilling the Seventh 5-Year Plan still lies in reform. Only by persisting in reform can we install vigor and vitality into our socialist construction cause and accelerate the development of the socialist productive forces. We should deepen our understanding of reform, reinforce our confidence in reform, display the spirit of daring to explore and to blaze new trails, and do a good job in the reforms of our own departments, units, and fronts, thus promoting the deep and healthy development in reform.

Third, it is necessary to vigorously contribute to vitalizing enterprises and raising economic results. In his Seventh 5-Year Plan Premier Zhao emphatically pointed out that under the new situation in which we are comprehensively carrying out reforms, all enterprises should enhance their sense of quality and economic results,their sense of catering to market and social needs, and the sense of contributing to making the country prosperous and strong and the people happy; continue to improve operation and management; and raise economic results. Otherwise, they will be eliminated by the trends. We should deeply understand this problem, and realistically and organically integrate the destiny of enterprises with our immediate interests in the production process, and manage enterprises and our own work with an attitude of being masters of the state. All fronts throughout the province should proceed from the reality; carry out all forms of the socialist labor emulation drive; fully display the key and vanguard role of model workers and advanced personages; foster the advanced, learn from, and catch up with the advanced; create more advanced units and foster more model workers and advanced personages in the province; and lead the broad masses of people in making great contributions to the two civilizations.

Fourth, it is necessary to study politics, culture, [word indistinct] and to improve our skills in serving the four modernizations. Our model workers should rally around the broad masses of workers and staff members; fully use all opportunities to study politics, culture, and technology; enhance their political, cultural, and professional expertise; and unceasingly improve their skills in serving the four modernizations and the people.

Fifth, it is necessary to consciously observe law and discipline, and resolutely resist and oppose all unhealthy trends. Our broad masses of workers and staff members should keep the true qualities of the laboring people. First, they should consciously observe the party and state policies, decrees, as well as the regulations and systems of their departments and enterprises, and be models in observing discipline and law. By no means should they follow the tide. Second, they should actively expose and report all kinds of criminal activities to the authorities, and resolutely struggle against them. In the course of checking unhealthy trends, we should also pay attention to drawing clear lines of demarcation in applying a policy in order to accurately and effectively check unhealthy trends and to ensure the smooth progress in reform and construction.

Comrades, the provincial CPC Committee and government are firmly convinced that the model workers and advanced collectives will take root, blossom, and bear fruit in every corner of Heilongjiang like seeds. Let us promote the spirit of the foolish old man who removed the mountain under the leadership of the party, unite as one, work with one heart and one soul, and exert efforts to realize the Seventh 5-Year Plan. [end recording]

After Sun Weiben's speech, the meeting participants unanimously adopted a letter of proposal for all workers throughout the province.

Attending today's meeting and sitting on the rostrum were responsible comrades of the provincial and Harbin City party, government, and army organs as well as of mass organizations, including Sun Weiben, Chen Lei, Hou Jie, Li Genshen, Chen Yunlin, Liu Chengguo, Zhou [name indistinct], Wang Yusheng, Wang Ochen, Zhu Dianming, Bai Jingfu, Huang Feng, Zhang Xiangling, Zhang Lin, Chen Yuanzhi, Lu Guang, Wei Zhimin, Wang Jinling, Wang Pili, Wang Zhaozhi, Wang Jun, Zhao Zhenhua, Zhang Ruoxian, Liu Zhongli, Jing Bowen, Li Rui, Bao Zong, Yang Zirong, Tang Liandi, Wang Weizhi, Guo Shouchang, Li Min, Huang Dexin, Fu Shiying, Hong Jing, Ma Xinquan, Xie Yong, Sha Zhao, Du Xianzhong, Zhang Li, Chen Youyi, (Shi Qing), and Hou Xuyu.

BRIEFS

BRAZIL WORKERS' DELEGATION--Yesterday evening, at the Cadres' Club, Ni Zhifu, director of the All-China Federation of Trade Unions and secretary of the Tianjin Municipal CPC Committee, received the delegation of the Brazil Federation of Industrial Workers, headed by its director Hesai Kalisiduo, and held a cordial discussion with them. After the reception, responsible persons of the Tianjin Municipal Trade Union Council hosted a banquet in honor of Hesai Kalisiduo and his entourage. The delegation of the Brazil Federation of Industrial Workers arrived in Tianjin on 21 April for a visit at the invitation of the All-China Federation of Trade Unions. The delegation visited Xingang Harbor, the International Seamen's Club, and the No 6 Cotton Textile Mill. Where the delegation went, it was warmly welcomed by the people. Responsible comrades of the Tianjin Municipal Trade Union Council briefed the delegation on the role played by the municipal Trade Union Council in reforming the economic structure. BRIEFS

LIUZHOU RAILROAD BUREAU SUCCESSES--At a press briefing this morning, Chen Kejie, director of the Liuzhou Railroad Bureau, said that the bureau scored notable success during the Sixth 5-Year Plan and fulfilled its target 1 year ahead of schedule. In 1985, the bureau increased its transport revenue by 25 percent compared with 1984, while profit rose by 19 percent, profit and tax delivery to the state increased by 16 percent, and transport labor productivity rose by 13 percent. The bureau outperformed all other railroad bureaus in the country in these four aspects. The bureau also ranked second in the whole country in passenger and freight turnround and in accident-free days. During the Seventh 5-Year Plan, the railroad bureau will increase transport capacity, carry more freight, and run more passenger trains through launching overall contract activities. It will ensure that railroad transport will provide better service for invigorating Guangxi's economy. [Excerpts] [Nanning Guangxi Regional Service in Mandarin 1000 GMT 17 May 86] /8309

ECONOMIC CONFERENCE WITH SAUDI ARABIA BEGINS

OW011049 Taipei CNA in English 0942 GMT 1 May 86

[Text] Taipei, 1 May (CNA)--The Ninth ROC [Republic of China] -- Saudi Arabia economic and technical cooperation conference opened in Taipei Thursday morning with the Saudi side calling for greater ROC participation in the kingdom's fourth 5-year development plan.

The meeting was jointly presided by Economics Minister Lee Ta-hai and Shaykh Muhammad Aba al-Khayl, Saudi minister of finance and national economy.

The conference is divided into five panels: technical cooperation, science-technology, finance, industry and trade.

Speaking at the opening ceremony, the Saudi minister said the present meeting marks more than a decade of "fruitful cooperation" between the two nations and underlines their "ongoing commitment to a strengthening of the traditional ties of friendship."

The shaykh recalled that Saudi Arabia had just completed its first 5-year plan when the initial agreement for economic and technical cooperation was signed 10 years ago.

"Today, in 1986, we are almost into the second year of our fourth 5-year plan, and can boast an economy which is fully equipped with a sound basic infrastructure, effective financial and administrative institutions and some very sophisticated export-oriented industries," he said.

In the fourth development plan, the Saudi minister said, the country is especially concerned with technology transfer and economic diversification.

"To this end," he added, "joint ventures have been designated as the main vehicle within the private sector for investment and industrial diversification."

The Saudi dignitary reminded his audience that his country remains one of the world's largest markets even with weaker oil prices.

While stressing governmental cooperation, he said Saudi Arabia also hoped to arouse Chinese interest in private sector joint ventures in the country that can help its middle-sized businessmen play a more effective role in the country's overall economy.

ECONOMIC GROWTH REPORTED UP IN FIRST QUARTER

OW300459 Taipei CNA in English 0315 GMT 30 Apr 86

[Text] Taipei, 30 April (CNA) -- With buoyant foreign trade, high industrial production, strong investment willingness, and in-pouring orders, the ROC's [Republic of China's] economic growth rate for the first quarter of this year reached 6.98 percent, and a further upward swing is expected, according to the Ministry of Economic Affairs [MOEA].

Meanwhile, owing to the appreciation of European currencies and the Japanese yen against the U.S. dollar, to which the NT [New Taiwan] dollar is pegged, Taiwan-made products have gained a stronger competitive edge in foreign trade. As a result, the equipment utilization rates for local manufacturing sectors have risen to 77.6 percent in March while the inventory for finished products has dropped to a moderate 62.5 percent.

Other economic indexes reveal that the ROC's economic performance in the first quarter include:

-- Import and export sales in the period totalled U.S. dollars 13.7 billion, up 13.9 percent over the same period a year earlier. Exports were U.S. dollars 8.38 billion, up 18.3 percent, and imports were U.S. dollars 5.33 billion, up 7.5 percent.

-- The gross national product (GNP) for the first quarter was NT dollars 620.6 billion, up 7.4 percent over the figure for the first quarter of 1985. The per capita GNP was U.S. dollars 825, 5.9 percent higher than the same period last year.

-- The output of industrial products advanced 7.6 percent, while the labor productivity of the manufacturing sector increased some 6.8 percent over 1985's first quarter record.

-- The gross fixed capital formation was 5.32 percent higher than the record a year earlier, among which machinery equipment investments increased 17.49 percent, investments in transportation equipment decreased 17 percent, and construction industry investments grew 2.5 percent. Investments by government agencies during the period increased 13.5 percent while investments by public-owned enterprises grew 13.2 percent.

COMMENTARY: AUTOMOBILE INDUSTRY NO THREAT TO U.S.

OW052317 Taipei International Service in English 0200 GMT 4 May 86

[Station Commentary]

[Text] Vincent Siew, the Republic of China's top trade official, said yesterday that the export ratio requirement the ROC Government has set on foreign-invested car plants in Taiwan will have no adverse effect on the American auto industry and should not be viewed as an unfair trade practice. He was commenting on reported U.S. concern that the export ratio requirement set for the joint-venture between Japan's Toyota Motor Company and the Kuo Chi Motor Company in Taiwan will adversely affect the American car makers.

Siew, who has a task force set up to deal with the question, said: The Kuo Chi-Toyota Agreement is not in violation of the General Agreement on Tariffs and Trade. He pointed out that the export ratio requirement will actually be beneficial to American interests in Taiwan. If the ROC Government did not insist that a certain percentage of Toyota's production in Taiwan be exported, the American-invested Ford-Liuho Company would probably be the first to suffer from raging competition from Toyota. Furthermore, the export ratio requirement in the Toyota-Kuo Chi joint venture can hardly be directed against the U.S. The reason is very simple. Toyota has already set up a large car plant in the U.S. It has no reason to export Taiwan products to U.S. markets to compete with its own cars made there.

Besides, there are arguments in favor of the Republic of China. The export ratio requirement should not be considered a violation of free trade principles because many developed countries, as well as developing nations, have similar requirements on joint venture companies. Even the U.S. itself has imposed a similar requirement on its semiconductor industry. If Washington insists on investigating the ROC's auto development project, the U.S. would also face similar requests from European nations in the future. That is not all. The ROC Government began discussing the export ratio requirement with Toyota long before the American Government worked out its new trade and tariff bill. Therefore, it is rather unfair for the U.S. to impose its recently passed domestic laws to force Free China to change the contents of its trade agreement with other countries. The export ratio requirement is only one of the irritants in the trade relations between the two countries. At the bottom of the issue, it is the huge trade surplus the ROC enjoys. The reasons for the development are complicated, as ROC spokesman Chang King-yuh pointed out in a recent speech in Houston. Nor is it as serious as the trade figure suggests. The important thing is that the strong economic relations between the Republic of China and the United States are mutually beneficial. Otherwise, they could not have developed so fast. With the ROC Government taking every step to redress the lopsided trade situation, a more equitable solution to the problem will not be difficult to find.

ECONOMIC DEVELOPMENT ZONES

SHANGHAI ECONOMIC ZONE MEETING HELD IN JIANGXI

OW222032 Nanchang Jiangxi Provincial Service in Mandarin 1000 GMT 20 May 86

[Text] According to our reporters Shi Shihai and Xue Renxin, the fifth theoretical symposium on the development of the Shanghai Economic Zone opened today in Shanghai City. Attending the symposium are Wang Lin, director of the Shanghai Economic Zone Planning Office of the State Council; Zhou Guangchun and Bai Yang, deputy directors of this office; Ni Xiance, deputy secretary of the provincial CPC committee and governor of the province; and Zhao Zengyi, chairman of the provincial advisory commission. Others attending are leading comrades from the relevant ministries and commissions of the State Council, the Shanghai Economic Zone Planning Office, and other provinces and municipalities, as well as experts and scholars, numbering more than 200 in total.

The main purpose of this symposium is to discuss in depth the strategic outline for the development of the Shanghai Economic Zone by integrating theory with practice and to probe the question of how to put the development of this zone in high gear with a view to bringing about the common prosperity of Shanghai Municipality and the four provinces involved.

Qin Benli, president of the Shanghai Economic Zone Research Society, delivered an opening address.

Comrade Ni Xiance also made a speech at the symposium. On behalf of the Jiangxi Provincial CPC Committee and People's Government, he extended a warm welcome to the comrades who had come for the symposium. Then, he said: Over the past 1 year or so since Jiangxi was included in the Shanghai Economic Zone, we have learned a lot of successful experiences and received guidance and assistance from Shanghai Municipality and the other provinces in this zone. Because of abundant resources, our province has a very great potential for development. During the Seventh 5-Year Plan, we will make active efforts to exploit our province's abundant resources according to the general strategy of making use of the favorable condition of rich resources to invigorate Jiangxi's economy. We must act more boldly and daringly to utilize more foreign capital and even dare to run into debt in order to proceed with construction. At the same time, we must go all out to develop economic and technological cooperation with others in the Shanghai Economic

Zone and with other provinces and municipalities. We must also acquire capital and technical personnel from other provinces and learn from their managerial experience so as to exploit the abundant resources and transform the enterprises so as to exploit the abundant resources and transform the enterprises in our province with a view toward common economic prosperity of our and other provinces.

Concluding his speech, Ni Xiance said: Jiangxi is prepared to adopt more preferential measures to solicit others in the Shanghai Economic Zone, departments of the State Council, other provinces and municipalities, and people from all circles to engage in development undertakings in our province so as to speed up the pace of our common progress.

ECONOMIC PLANNING

YUNNAN'S 1985 ECONOMIC, SOCIAL DEVELOPMENT STATISTICS

HK280726 Kunming YUNNAN RIBAO in Chinese 5 Apr 86 p 2

["Communique on Yunnan's 1985 National Economic and Social Development Statistics Issued by the Yunnan Provincial Statistical Bureau"]

[Text] In 1985, under the leadership of the provincial CPC Committee and provincial government, the people of all nationalities in Yunnan earnestly implemented the policy if invigorating the domestic economy and opening up to the outside world, developed the reform of the economic structure in depth, and promoted Yunnan's economic and social development. The total product of society came to 28,757,000,000 yuan, a 12.6 percent increase over 1984. (The total product of society is the sum of the total output value of agriculture, industry, the building trade, transportation, posts and telecommunications, and commerce, including the supply and marketing of materials and equipment and the catering trade. National income is the sum of the net output value of the above five material producing departments. All figures for the total product of society, the total industrial and agricultural output value, national income, and gross national product cited in this communique are calculated in terms of 1985 prices, and the percentage increase over the previous year is calculated in terms of comparable prices.) Of this sum, the total industrial and agricultural output value reached 22,514,000,000 yuan, an increase of 11.8 percent over 1984 and exceeding the planned target of 7.2 percent growth. National income totaled 14,277,000,000 yuan, a 10.5 percent increase over 1984. The major national economic targets prescribed by the Sixth 5-Year Plan were fulfilled or overfulfilled. Along with the sustained growth of production, the market was brisk, revenue rose remarkably, and urban and rural residents' income increased. According to preliminary estimates, Yunnan's gross domestic product for 1985 was 15.69 billion yuan, or 11 percent more than in 1984. (Gross domestic product refers to the value of products and labor services used by society and supplied by material production departments and non-material production departments, not including the value of products and labor services consumed by intermediate units.) The major problems in Yunnan's national economic development are excessive investment in fixed assets, social purchasing power outstripping the supply of commodities, and substantial price hikes of some goods, particularly fresh vegetables, fruit, meat, poultry, eggs, books, newspapers, and magazines.

I. Agriculture

In 1985, Yunnan's rural areas took a major step toward reforming the system of fixed state purchases of farm produce and readjusting the production setup, both of which sparked continued and comprehensive rural economic development. The total product of society in the rural areas was 11,628,000,000 yuan, a 12.6 percent increase over 1984. (Total rural product of society includes the gross output value of agriculture, the gross output value of town and township industry and individually run rural industries, and the gross output value registered by collective and individually run building industry, transportation, posts and telecommunications, and commerce.) Of this sum, the proportion of the output value of industry, the building trade, commerce, and transportation rose from 20.7 percent in 1984 to 23.6 percent.

The total output value of agriculture was 9,656,000,000 yuan (including that from rural industries), up 8.2 percent from 1984 and exceeding the planned target of 6 percent growth. Of this, the proportion of forestry, animal husbandry, fishery, and sideline production rose from 44.2 percent in 1984 to 47.7 percent. After deducting the output value of rural industries from this sum, the total output value of agriculture is 8,883,000,000 yuan, a 6.4 percent increase over 1984.

The crop cultivation structure underwent major readjustment. As a result of frequent natural disasters, the total output of grain was 9.35 million tons (18.7 billion jin), 700,000 tons (1.4 billion jin) less than in 1984. Except for oil-bearing crops, whose output decreased because of a reduction in cultivated areas, the output of all other major cash crops registered a fairly big increase. The output of major farm products was as follows:

	1985	Percentage Increase Over 1984
Grain	9,350,000 tons (1.87 billion jin)	- 7.0
Oil-bearing crops	118,100 tons	- 4.5
of which, rapeseed	71,700 tons	-14.3
Sugarcane	4,797,700 tons (95,954,400 dan)	27.0
Cured tobacco	410,000 tons (8,200,000 dan)	49.1
Tea	31,100 tons (621,500 dan)	10.3
Silkworm cocoons	1,800 tons	2.9

The further implementation of the forestry policies aroused the enthusiasm of the masses for afforestation. The whole province afforested an area of 60.57 hectares (9,086,000 mu), an increase of 9.6 percent over 1984. The output of major forest products increased somewhat. The output of rubber increased 4.1 percent; raw lacquer, 10.8 percent; walnuts, 8.6 percent; and chestnuts, 19 percent. But the output of tung-oil and tea-oil seeds decreased slightly.

Further progress was made in animal husbandry. The output of pork, beef, mutton, and milk increased rapidly. The number of large animals and pigs on hand at year-end continued to increase, but the number of sheep on hand dropped slightly. The output of major animal by-products and number of livestock were as follows:

	1985	Percentage Increase Over 1984
Output of pork, beef, and mutton	568,300 tons	10.2
of which, pork	544,000 tons	9.0
Milk	42,200 tons	13.7
Large animals at year-end	8,741,300 head	5.9
Pigs at year-end	17,033,000 head	0.1
Sheep and goats at year-end	7,239,400 head	- 2.6

Fish production grew considerably. The output of aquatic products was 26,500 tons, a 22.7 percent increase over 1984.

Farm machinery and electricity consumption in the rural areas increased, with the exception fo large and medium tractors and irrigation and drainage equipment, which decreased. The aggregate power of the province's farm machines reached 5,972,400 horsepower, a 7.9 percent increase over 1984. The number of large and medium tractors was 17,700, a decrease of 3.8 percent from 1984; small capacity and walking tractors, 73,800, an increase of 20.8 percent; trucks, 10,500, up 40 percent; irrigation and drainage machines, 41,800, down 9.9 percent; chemical fertilizers applied, 1,558,600 tons, up 5.9 percent; and consumption of electricity in rural areas, 754 million kilowatt hours, up 12.5 percent. The area under effective irrigation was 14,474,300 mu, an increase of more than 50,000 mu over 1984.

The province's meteorological departments improved their weather forecasting and made timely and accurate forecasts in some areas threatened by natural disasters, thus reducing losses to agriculture caused by calamities.

II. Industry

In 1985, the reforms of the industrial system progressed steadily, the vigor of enterprises was further enhanced, light and heavy industry developed in a coordinated manner, energy production basically met the needs of national economic development, output of marketable products increased remarkably, and overall economic results improved. The total industrial output value for 1985 was 12,858,000,000 yuan, an increase of 14.6 percent over 1984, exceeding the planned growth target of 8.2 percent. When added to the output value of rural industry, the total figure is 13,626,000,000 yuan, a 15.5 percent rise over 1984. Of the total, the output value of state-owned industry increased 13.1 percent over 1984, collective-owned industry grew by 20.9 percent, individually-run industry in cities and towns went up by 21.8 percent, and industry of other kinds of ownership rose 130 percent. The total industrial output value of 8 autonomous prefectures and 19 autonomous counties increased by 17.4 percent over 1984. The output of 42 of the 60 major industrial products met or topped provincial plans. They included steel, 10 kinds of nonferrous metals, coal, generated energy, caustic soda, chemical fertilizer, tires, cement, power generating equipment, walking tractors, television sets, bicycles, chemical fibers, woollen piece goods, machine-made paper and paperboard, cigarettes, bulbs, detergents, household washing machines, and beer. The output of 18 industrial products failed to meet the 1985 planned quotas. They included phosphate rock, phosphate fertilizer, insecticides, and sewing machines. The production of these goods was curtailed as a result of supply outstripping demand.

The total output value of light industry in 1985 was 6,223,000,000 yuan, a 16.2 percent increase over 1984. The designs and varieties of light industrial products expanded and the output of high and medium grade products increased considerably. Some products that had been in short supply, however, still failed to keep up with demand. The output of major light industrial products was as follows:

	1985		Percentage Increase Over 1984
Cotton yarn	35,712	tons	9.9
Cloth	151.52	million meters	5.6
Woolen piece goods	271,300	meters	29.1
machine-made paper and paper board	101,645	tons	31.7
Sugar	328,300	tons	6.7
Cigarettes	2,062,500	cartons	17.8
Fine tea	22,036	tons	6.9
Chemical Pharmaceuticals	142	tons	2.3
Detergents	19,198	tons	36.0
Bicycles	250,100	tons	91.4

Sewing machines	7,404	500.0
Wristwatches	72,400	11.7
Televisions	111,408	79.0
of which, color sets	31,155	2,950.0
Cassette recorders	30,525	35.8
Household washing machines	45,369	61.1
Household refrigerators	17,000	750.0

The 1985 heavy industrial output value was 6,635,000,000 yuan, up 13.1 percent from 1984. Primary energy output was equivalent to 11,638,600 tons, an increase of 8.1 percent over the previous year. The output of major heavy industrial products was as follows:

	1985		Percentage Increase Over 1984
Coal	16,380,000	tons	6.6
Electricity	7,545,000,000	kilowatt-hours	7.4
of which, hydro-electricity	4,523,000,000	kilowatt-hours	14.8
Steel	561,600	tons	5.2
Rolled steel	483,900	tons	- 4.0
10 kinds of nonferrous metals	149,753	tons	9.6
Timber	3,315,000	cubic meters	8.1
of which, commodity timber	2,680,800	cubic meters	24.5
Cement	3,077,600	tons	16.4
Plate glass	874,200	standard cases	-17.1
Sulphuric acid	210,421	tons	- 9.2
Caustic soda	21,527	tons	4.8
Chemical fertilizers	602,000	tons	1.6
Chemical insecticides	952	tons	-35.4
Outer tires	295,800		3.6
Power generating equipment	48,300	kilowatts	87.5

Machine tools	3,594	14.8
Trucks	5,455	100.0
Walking tractors	11,629	17.8
Internal-combustion engines	730,400 horsepower	43.7

Industrial economic efficiency further improved. Per capita productivity for state-owned industrial enterprises was 1,789 yuan, 7.9 percent higher than in 1984. The total output value of the budgeted industrial enterprises increased by 18.9 percent over 1984. Their sales income went up by 17.8 percent, their profits and product sales taxes rose by 24.5 percent, and their taxes turned over to the higher authorities increased by 23 percent. The turnover period for working funds was shortened from 97.8 days in 1984 to 95.3 days in 1985. However, the production costs for some comparable products rose by 6.2 percent over 1984. The quality of some products declined, consumption of raw materials increased, and deficits of some departments and localities went up.

III. Investment in Fixed Assets and the Building Trade

The construction of key projects and the updating and revamping of old enterprises were stepped up in 1985, and the management system underwent further reform. Total investment in fixed assets throughout the province came to 4.8 billion yuan, a 45.5 percent increase, or 1.501 billion yuan more than in 1984. Of the total, 3.372 billion yuan was in state-owned enterprises, 743 million yuan was in urban and rural collectively-owned enterprises, and 685 million yuan was from urban and rural individual investment. Of the investment in fixed assets for state-owned enterprises, 2.147 billion yuan went into capital construction, a 56.4 percent increase, or 775 million yuan more than in 1984. Of this, 572 million yuan was investment directly called for by the state plan, accounting for 91.5 percent of the state's adjusted plan. The newly added fixed assets in 1985 was 1.507 billion yuan and the rate of fixed assets put into use was 70.2 percent.

Construction of key projects was strengthened. Of the investment in capital construction, 567 million yuan was for energy projects, up 80.2 percent from the previous year; 239 million yuan for transportation and posts and telecommunications, up 190 percent; 34 million yuan for scientific research, up 39.3 percent; and 171 million yuan for education, up 49.7 percent. Investment in productive projects totaled 1.181 billion yuan, a 43.5 percent increase over 1984. Investment in non-productive projects was 966 million yuan, up 75.7 percent. Of this, investment in housing projects amounted to 438 million yuan, up 60.6 percent.

A number of key construction projects were completed on schedule and put into operation. The first phase project of the Kunming timber sodium phosphate plant, a key project of the state, passed the state inspection test and was put into operation. In the Nubuge hydropower station project, a dam was successfully built on schedule in November. Of the 36 key projects of the province, the following were completed and put into operation: The Jingkan sugar refinery, the Nongzhang sugar refinery, the Ruili sugar refinery, the Pengpu sugar refinery, and the Yimen copper mine. The following were expected to be completed and put into operation within a year: the No 1 generating unit of the second Xiaolongtan power plant, the southern vulcanization section of the ore dressing plant under the Yunnan Tin Company, the double superphosphate and sulphuric acid workshop of the Yunnan phosphate fertilizer plant, and the Puing phosphate mine of the Kunyang Phosphate Mining Bureau.

Capital construction last year helped add the following industrial capacities: 25,000 tons of detergent, 59,000 tons of machine-processed sugar, 119,000 kilowatts of power generating capacity, 1,184 tons of tin-containing concentrate, 3,366 tons of concentrate (containing copper), 296,000 tons of copper, and 300,000 tons of rock phosphate.

Headway was made in the technological transformation of existing enterprises. In 1985, state-owned enterprises made use of a total investment of 1,225 million yuan for equipment replacement, technological transformation, and other fixed assets, 17.7 percent more than the previous year. Of this amount, 978 million yuan was invested in equipment replacement and technological transformation, 133.7 percent of the planned 615 million yuan investment. Of the investment in equipment replacement and technological transformation, 207 million yuan was used to increase product variety and improve product quality and 237 million yuan was used to conserve energy and raw and semi-finished materials and strengthen transportation and posts and telecommunications. Of the 2,272 projects undergoing equipment replacement and technological transformation, 1,299 were completed and put into operation, which played an important role in bringing about technological progress in enterprises.

Equipment replacement and technological transformation last year helped and the following industrial capacities: 5,000 tons of caustic soda, 335,000 tons of cement, 14,000 tons of alcohol (including 5,000 tons of beer), 35,000 tons of sugar, 195,000 cartons of cigarettes, 538 kilometers of rebuilt highways, and 3,000 telephone switchboards in urban areas.

Further advances were made in the reform of the administrative systems of the building industry and capital construction. Of the 6,659 state-owned construction projects, 5,464 introduced various forms of contracted responsibility systems. The reforms brought about better economic results. The total output value of state-owned construction enterprises in 1985 rose 21.3 percent over the preceding year and per capita labor productivity was 19.4 percent higher than in 1984.

Geological survey work registered marked achievements in 1985. The provincial geological bureau and the geological units of the non-ferrous metal, coal, building materials, chemical industrial, and petroleum departments discovered and assessed 116 mineral-bearing areas and submitted 44 geological reports for industrial and agricultural construction. The targets for discovered reserves of 8 major minerals all surpassed the state targets.. Tunnelling footage completed in the year totaled 300,000 meters, 30,000 meters more than in 1984.

IV. Transportation, Posts, and Telecommunications

Reform and the measures adopted to tap latent potential enhanced the capacity of transportation. The volume of goods handled by various transportation means totaled 200 million tons, up 7.4 percent from 1984. Of the total, the goods handled by non-transportation departments increased by 22.9 percent over the previous year. The various transportation departments handled 8,562 million ton-kilometers of goods, a drop of 1.1 percent from 1984. Of this, the railways handled 6,483 million ton-kilometers, up 3.4 percent; trucks handled 2,039 million ton-kilometers, down 2.9 percent; ships and boats handled 39.45 million ton-kilometers, down 1 percent; and planes handled 541,600 ton-kilometers, up 28.3 percent.

The gross volume of passenger transportation was 7.285 million person-kilometer, a 26.5 percent increase over 1984. Of this, the volume of railway passenger transportation was 1,956 million person-kilometers, up 16.9 percent from 1984; the volume of road passenger transportation, 5,254 million person-kilometers, up 30.7 percent; the volume of waterway passenger transportation, 32.14 million person-kilometers, up 13.3 percent; and the volume of air passenger transportation, 43.02 million person-kilometers, up 23.7 percent.

Posts and telecommunications developed considerably. Transactions in 1985 amounted to666.75 million yuan, a 15.5 percent increase over the previous year. The number of letters handled went up 18.9 percent; newspapers and magazines distributed rose 12.8 percent; telegrams increased 22.6 percent; and long-distance telephone calls were up 16.1 percent. The year-end number of telephone subscribers in urban areas was 36,500, a 12.8 percent increase over the previous year.

Economic results improved in the transportation and posts and telecommunications departments. Income from railway transportation went up 7 percent and per capita productivity increased 7.2 percent over 1984. The average output of each locomotive rose 1.2 percent a day. Profits earned by enterprises directly under the administration of the Ministry of Communications increased by 150 percent over 1984. Local and rural telephone service reduced deficits by 300,000 yuan.

V. Domestic Trade and Supply and Marketing of Materials

Urban and rural markets thrived in 1985. The province's 1985 retail sales reaches 9.320 billion yuan, a 26.39 percent increase over the previous year (a 16.9 percent increase if price increases are factored in). Of the total sum, retail sales of consumer goods rose 28.8 percent and retail sales of farming materials and equipment went up 6.7 percent. Retail sales of 8 autonomous prefectures and 19 autonomous counties increased by 28.3 percent over 1984.

Retail sales of most principal consumer goods increased over 1984. Increases included grain, up 6.6 percent; vegetable oils, down 7.8 percent; eggs, up 13.3 percent; sugar, up 21.6 percent; cotton cloth, 31 percent; synthetic fabrics, up 22.6 percent; woollen piece goods, up 18.6 percent; silks and satins, up 52.4 percent; knitting wool, up 4.4 percent; knitwear, up 18.5 percent;

wristwatches, up 46.1 percent; bicycles, up 60.8 percent; cameras, up 25.2 percent; electric fans, up 67.3 percent; television sets, up 42.2 percent; cassette recorders, up 58 percent; washing machines, up 52.6 percent; and refrigerators, up 1,000 percent.

The reform of the commercial system developed significantly and the circulation of commodities quickened. By the end of 1985, the province had decontrolled 12 second-level industrial goods wholesale centers, accounting for 63.2 percent of those that should be decontrolled. A total of 4.325 small state-owned enterprises in the retail business, the catering trade, and other services were given a free hand in management, accounting for 96.5 percent of the total number of small enterprises. The number of commodity fairs in both cities and countryside increased from 2,554 at the end of 1984 to 2,665 in 1985. Trade value in 1985 amounted to 2.228 billion yuan, a 42.5 percent increase over the previous year. Retail sales in all economic sectors increased considerably. The total amount of retail sales in the state-owned sector grew 6.1 percent, while retail sales in the collective sector (including the supply and marketing cooperatives) rose 36.5 percent. Sales in the individual sector went up 82.8 percent. Sales in other economic sectors increased 84.4 percent, while retail sales by farmers to non-agricultural residents went up 48 percent.

The smooth take-off of the price reform in 1985 accelerated the development of the commodity economy, and market prices rose considerably. The general price indices for state purchases of farm and sideline products rose an average of 16.7 percent over 1984. The general retail price index in 1985 increased 8 percent over the previous year. The general retail price index rose an average of 12.7 percent in the cities and 4.9 percent in the countryside. The price of fresh vegetables rose 52.6 percent; meat, poultry, and eggs, 33.5 percent; aquatic products, 31.5 percent; fruit, 54 percent; grain, 10 percent; traditional Chinese medicines, 6.5 percent; books, newspapers, and magazines, 38.6 percent; and fuel, 3.1 percent. Retail prices for consumer goods such as garments and cultural and recreational goods increased slightly as well. The cost of living index of workers and staff went up 11.9 percent over 1984.

Sales of the major means of production in 1985 rose over the previous year. Coal sales increased 7.9 percent and cement 11.3 percent. Due to the short supply of billet and the consequent reduction of steel output, sales of rolled steel dropped 2.1 percent. With the gradual development in the reform of the material circulation system and with the increased scope of market regulation, the number of capital goods trade centers increased from 4 in 1984 to 21 in 1985 and their business volume reached 169 million yuan in 1985. The time for the turnover of fixed-quota circulating funds of the material supply departments was 94 days, 18 days less than in 1984.

VI. Foreign Trade and Tourism

The province's import and export expanded remarkably in 1985. According to statistics compiled by the province's foreign economic and trade department, imports and exports came to $209.52 million, a 36.1 percent increase over 1984. Of this, exports totaled $129.01 million, an increase of 15.8 percent over the previous year. Imports totaled $80.51 million, up 88.9 percent.

More foreign capital was used in 1985. The province used $1,637.700, a 650 percent increase over 1984. This included $1,564,900 in direct foreign investment, up 880 percent.

Further advances were made in economic cooperation with foreign countries. In 1985 the province signed three contracts for overseas projects and labor service, altogether worth $665,300. That same year, the province fulfilled contracts worth $6.84 million, a 33.7 percent increase over 1984.

The tourism industry developed steadily. A total of 72,000 visitors from over 50 countries and regions came to Yunnan in 1985 on tours and visits and for trade, sports, scientific, and cultural exchanges, a 28.6 percent increase over the previous year. The total included 47,000 foreigners, a 34.3 percent increase, and 25,000 overseas Chinese and Hong Kong and Macao compatriots, up 19 percent. Income from tourism amounted to 26.88 million yuan (foreign exchange certificates), up 93.4 percent from 1984.

VII. Science, Education, and Culture

Science and technology advanced amid reform, making fresh contributions to economic construction. The province's 56 key technological popularization projects yielded improved economic results. Of the 23 major scientific and technological hurdles to be tackled, 8 were fulfilled or passed the inspection test. A total of 144 scientific and technological research results won prizes from the provincial government. Last year, 154,100 natural science professionals and technicians were employed in state-owned enterprises and there were 94,500 people working in social sciences.

Education benefitted from structural reform. In 1985 institutions of higher learning enrolled 448 graduate students, 258 more than in the previous year. There were 724 graduate students in the province, 348 more than in 1984, and 98 graduate students completed their degrees. Following the reform of the enrollment and placement systems, universities and colleges enrolled 12,600 students, 3,700 more than in 1984. These schools had a total student body of 32,300 last year, 2,300 more than in 1984. Last year, 5,400 students graduated from these institutions. Adult higher education institutions enrolled 8,200 students, 3,900 more than the year before. The number of students studying in these institutions totaled 159,000, an increase of 5,600 over 1984. Graduates from these schools totaled 2,600.

Restructuring continued in secondary education. Secondary schools had an enrollment of 1,110,900 students, 98,800 more than in 1984. Vocational and technical schools (equivalent to senior middle schools) had 12,800 students; their proportion to the total number of senior middle school students increased from 4.7 percent in 1984 to 4.9 percent in 1985. There were 1,200 students studying at adult middle schools and 24,500 at adult secondary technical schools.

Progress was made in popularizing primary education. In 1985 there were 5,146,600 pupils in primary schools, and the attendance rate of preschool children increased from 92.2 percent in 1984 to 93.1 percent in 1985.

Considerable headway was made in preschool education and programs for the blind, deaf, mute, and mentally retarded.

Cultural units and the media made significant contributions to developing socialist spiritual civilization. The province had 6,888 cinemas and film projection teams, 156 performing art troupes, 130 cultural clubs, 149 public libraries, and 12 museums. In addition, there were 7 broadcasting stations, 24 radio transmitting and relay stations, and 12 television transmitting and relay stations, each with a capacity of more than 1,000 watts. Some 198.86 million copies of provincial newspapers, 11.607 million copies of magazines, and 110,872,100 books and picture books were published last year.

VIII. Public Health and Sports

Medical and health conditions steadily improved. The number of hospital beds in the province reached 68,000 at the end of 1985, an increase of 2.8 percent over the previous year. Professional health workers numbered 87,300, up 3.2 percent from 1984. Of this, 42,700 were doctors (including physicians practicing traditional Chinese and Western medicine), a 4.3 percent increase; and 17,400 were nurses, up 3.8 percent.

Sports made further headway. In 1985 the province's athletes broke two national records on four occasions. Last year, five athletes won the title of master athlete, and sports became more popular all over the province.

IX. Living Standards

Living standards in both urban and rural areas improved in 1985. A sample survey of 2,400 peasant families in 40 counties showed an average per capita net income of 338.34 yuan (including 300.02 yuan from productive activities and 38.32 yuan from cash and articles remitted or brought back by family members working away from home, and relief funds issued by the state), 14.7 percent more than in 1984. If price hikes are factored in, real income increased 8.5 percent. A small number of low-income farmers, however, still led fairly difficult lives.

A sample survey of 500 worker and staff member families in Kunming, Gejiu, and Xiaguan cities showed an average annual per capita income of 761 yuan, a 31.8 percent increase over 1984. Even allowing for the rise in the cost of living, real income for workers and staff members still rose by 17.8 percent.

In 1985 jobs were given to 84,100 people in urban areas. The province had 2,630,000 workers and staff members by the end of the year, 63,600 more than at the end of 1984. Self-employed workers in cities and towns totaled 116,600, an increase of 33,700 over the previous year. The annual wages of workers and staff members in 1985 totaled 3,013 million yuan (the total wages of workers and staff members), an increase of 24.3 percent over 1984, circulated on comparable prices. The average annual cash wages for workers and staff members was 1,171 yuan, 21.1 percent more than in 1984. The actual increase in workers' wages stood at 8.2 percent when the cost of living increase was factored in.

Labor protection work was strengthened somewhat in 1985. The number of workers of state-owned enterprises who died in the course of duty dropped 0.9 percent from 1984.

Urban and rural savings deposits increased by a big margin. By the end of 1985, individual bank savings amounted to 2,984 million yuan, 34.2 percent more than the 1984 year-end figure.

Housing for both urban and rural dwellers improved. Houses completed in cities and towns in 1985 totaled 3.51 million square meters in floorspace, and those built by farmers in the countryside totaled 14.37 million square meters.

Social welfare services continued to improve. There were 34 social welfare institutes in 1985 providing for 1,659 people throughout the province. Social welfare services run by rural collectives developed considerably, providing for 68,000 elderly, disabled, and orphans who had no other means of support.

X. Population

According to a sample survey of 19 counties and cities, the province's birth rate in 1985 was 21.48 per thousand, the morality rate was 8.02 per thousand, and the natural growth rate stood at 13.46 per thousand. Simple surveys indicated that by the end of 1985 Yunnan had 34,080,000 people, 460,000 more than the 1984 year-end figure.

NORTHEAST ECONOMIC ZONE INCREASES INDUSTRIAL OUTPUT, SALES

SK220133 Shenyang DONGBEI JINGJI BAO in Chinese No 39, 19 Apr 86 p 1

[Text] In the first quarter of this year, the industrial output of the Northeast China Economic Zone increased steadily and the total volume of the retail sales of commodities also increased.

According to statistics, in the first quarter of this year, the industrial output value of the Northeast China Economic Zone was 29,785.78 million yuan, an increase of 4.5 percent over the corresponding period of last year. Of this, the industrial output value realized by Liaoning Province was 15,629.78 million yuan, an increase of 3.8 percent; that by Jilin Province was 5,107.27 million yuan, an increase of 8.8 percent; that by Heilongjiang Province was 8,383.5 million yuan, an increase of 1.9 percent; and that by the four leagues and city in the eastern part of Nei Monggol Autonomous Region was 665.34 million yuan, an increase of 25.9 percent.

Of the total industrial output value, the growth rate of the light industrial production was higher than that of the heavy industrial production. Comparing the first quarter of 1986 with that of 1985, the output value of the light industry of the Northeast China Economic Zone showed an increase of 5.9 percent and that of the heavy industry increased by 3.8 percent.

In the first quarter of this year, the total volume of retail sales of commodities of the Northeast China Economic Zone was 15,184.34 million yuan, an increase of 6.4 percent over the corresponding period of last year.

The total volume of the retail sales of commodities of Liaoning Province was 6,078.89 million yuan, an increase of 4.4 percent over the same period of last year; that of Jilin Province was 3.624.09 million yuan, an increase of 11.4 percent; that of Heilongjiang Province was 4,528.39 million yuan, an increase of 3.7 percent; and that of the four leagues and city in the eastern part of Nei Monggol Autonomous Region was 951.97 million yuan (not including the volume of commodities sold by peasants to nonagricultural residents), an increase of 14.9 percent.

ECONOMIC MANAGEMENT

IDEOLOGICAL PRICE REFORM QUESTIONS PRESENTED

Beijing NONGMIN RIBAO [Peasant Daily] in Chinese 26 Mar 86 p 4

[Article by Cheng Zhiping [2052 5268 1627], Director, State Price Bureau: "Several Questions Regarding an Ideological Understanding of the Price Reform"]

[Text] Editor's Note: This is part of the author's talk at a conference where he interpreted and explained certain comments relating to some of the masses' questions regarding pricing. This is a summary of the original that was published in LILUN DONGZH [Theoretical Trends].

"Is Price Reform the Same as Rising Prices?"

China's price reforms are mainly structural readjustments. There are price rises and falls; by no means is it all rises. Nevertheless, in the process of price reform, because of the relatively low prices of some of China's agricultural and basic industrial goods, except for striving to improve enterprise management, lowering consumption, and energetically disposing of some other items, we must basically rationalize prices within the next several years. Prices of some commodity goods and the general price level will increase in a certain number of years and this will be unavoidable. Viewing the commodity price situation over the past several years, under general conditions of moderate changes in the general commodity price level, prices of some commodities rose in a controlled way in accordance with the endurance capacities of the socialist economy. In this way, production was beneficially developed, markets enlivened, there was an abundant variety of goods and the people's livelihood was stable. This also stimulated the strengthening and flourishing of the nation, creating justice and peace. If we firmly surpress retail prices and do not permit them to change, over time this has to contract the margin between commodity buying and selling price differences to the point where it makes them turn around. Fiscal subsidies are greatly increasing, impeding the sale of goods and making more purchasers stand in line. In this way, a crisis may develop at a certain point. For a relatively long period hereafter, China's price reform must strive to protect basic price stability, adopt a method of gradual advance and turn small victories into large ones to achieve the goal of a basically rational price system.

Price Levels and the People's Livelihood.

On the surface, rising prices and improved livelihood are mutally contradictory. Viewing the situation of the past several years, the state increased some commodity prices in a planned and controlled way (of course, uncontrolled inflation must be decisively stopped). This is advantageous to promoting production and improving supplies. On the one hand, commodity price levels increased, and on the other hand, because of increased production the standards of living of broad massses of the people also improved, so it should be recognized that rising price levels and improved livelihood of the people also have a unified aspect.

Viewing the situation in 1985, when price rises compared to previous years were rather large, the income increases of the masses were also rather rapid. Although grain decreased in rural areas, quite a few economic crops increased in output, and most agricultural and sideline product prices were freed. Industrial and sideline industries developed rapidly, and the net incomes of peasants for the year are estimated to be over 10 percent greater than the 1984 level. Generally speaking, because the reform encouraged production, real household incomes of the great majority of the people still increased even after allowing for price rises.

Reforming the Price System: "Liberalization," "Readjustment," and "Market Participation" Are All Necessary

By studying the liberalization of live pork and certain fresh sideline food product prices, the state has determined that negotiated price guidelines must be used for live pork, vegetables and other important sideline food products. Prices will also be regulated under the guideline pricing of the state plan and based on the requirements of the law of value by means of economic processes and necessary administrative measures. State-run stores must positively participate in market readjustment, take up their leadership roles, sucessfully regulate shortages nad surplusses, maintain even prices and stabilize markets. The party Central Committee and the State Council have repeatedly asserted that during comprehensive reform of the price system "liberalization" (price liberalization), "readjustment" (readjustment of commodity prices), and "participation" (participation of state-run stores and supply cooperatives in market readjustment) are all essential. This is an essential condition for the smooth implementation of price reform and is also an important characteristic of a planned commodity economy.

One thing we must oppose after price reform is holding onto old methods and treating liberalized prices as secondary list prices. On the other hand, we must avoid thinking that liberalized prices are not to be managed at all and allowing the market to readjust itself, enduring explosive price fluctuations to the point that once produced, the danger is ignored. This is irresponsible to the state and to the people. We must firmly oppose and put a halt to it.

Practice proves that regarding the price liberalization on meat, vegetables, and other important sideline food products, if the state successfully performs the task of adjusting supply and demand to encourage production and brings into play the leadership role of state-run enterprises, then although prices will increase for a certain period, they will gradually tend to become rationalized and achieve a relative equilibrium.

Commodity Pricing Requires Comprehensive Management

Some people assert, "Why doesn't the Price Bureau administer prices?" We say that whether prices can maintain a basic stability and promote the continued health and even development of the state economy not only involves pricing departments, but also every economic sector. Even ideological and political work departments are involved to a certain extent. Prices are the mainifestation of the law of value. Price changes are mainly affected in three ways: 1. Chnages in commodity value. 2. Changes in supply and demand relations. 3. Changes in the quantity of money in circulatiion. Therefore, to preserve basic price stability, we must improve the economic results of enterprises, produce and supply saleable goods, restrict the production and supply rate of heavy industry and the growth ratre of fixed capital investment, and avoid excessive speed. We must limit the growth of consumption funds and credit and overcome the problem of blind inflation. In sum, basically speaking, we cannot overallocate state revenues. We definitely must maintain a balanced supply and demand of materials and commodities. Additionally, we must also strengthen political-ideological work, make each economic department motivated to achieve its best, not disguise price rises, or short, skimp, cheat or harm consumers. We often say the price situation is a comprehensive reflection of the condition of the state economy, and so the pricing problem requires comprehensive management.

SHAANXI PROPOSES FIVE MEASURES FOR STABILIZING PRICES

Xian SHAANXI RIBAO in Chinese 11 Mar 86 p 1

/Article by Chai Liaozi /2693 1675 4371/: "Shaanxi Provincial Government Proposes Five Measures for Stabilizing Commodity Prices"/

/Text/ At a conference on commodity prices in Shaanxi, it was pointed out that the province had, by adopting a series of reforms in 1985, basically resolved the problem posed by the price of grain in the rural areas, readjusted the policy regarding the purchasing and selling of pigs, gradually lifted control over the prices of such perishable subsidiary foodstuffs as meat and vegetables, readjusted freight rates for short-distance railway transportation, relaxed price control over the means of industrial production outside the plan, and engaged in market readjustments. Preliminary reforms of the price structure have effectively served to promote the development of the commodity economy in the province. One major task concerning commodity prices in 1986 calls for consolidation, digestion, replenishment, improvement of the measures which had been adopted for price reforms, and the maintenance of the basic stability of commodity prices. Five specific measures were proposed at the conference for the stabilization of retail prices in the market. First, is the adoption of the contract system, the assumption of responsibility and strict control over the general increase in retail prices. Second, is the exercise of the proper degree of centralized control over commodity prices to forestall random price increases under various pretexts. Third, is the stabilization of prices for key commodities, especially those for subsidiary foodstuffs. Fourth, is the extension of assistance to the enterprises to exploit their potential, countering the effect of price increases in raw materials and readjusting and exercising control over the prices of the means of production outside the plan. Fifth, is the continuous supervision over and inspection of commodity prices to prevent price increases at random in violation of the policy concerning commodity prices.

COMMODITY PRICE DIRECTORS REVIEW INSPECTION WORK

OW151603 Beijing XINHUA in English 0801 GMT 15 May 86

[Text] Beijing, May 15 (XINHUA)--Nationwide price inspection focused on pork, poultry, eggs and other necessary daily goods will be stepped up in the second half of the year, according to the State Administration of Commodity Prices.

In order to make sure the work goes smoothly and effectively, directors of the country's provincial and municipal administrations of commodity prices met here today to discuss concrete measures.

Wang Xinjia, deputy director of State Administration of Commodity Prices, told XINHUA today that the inspection aims to guarantee stable prices and prepare for a further price reform planned for the next couple of years.

He stressed that cases of illegal price rises must be strictly handled according to the relevant regulations.

Since the initial reform of the price system last year, the Chinese Government has paid great attention to keeping prices stable and taken various measures to tackle illegal price rises.

During last year's nationwide price inspection, the state handled more than 394,000 such cases and confiscated over 430 million yuan gained by illegal prices rises, of which about 60 million yuan was returned to consumers.

Observers here pointed out that, apart from some lawless elements, such annoying cases happen because of loopholes in the relevant regulations.

They said that during the seven-day meeting, directors in charge of price monitoring might make up several new regulations, but the sources from the State Administration of Commodity Prices delcined to give more information on this point.

ECONOMIC MANAGEMENT

HUBEI PUTS FOCUS ON IMPROVING MANAGEMENT OF ENTERPRISES

Wuhan CHANGJIANG RIBAO in Chinese 12 Mar 86 p 1

/Article by correspondent Pi Gongliang /4122 0361 0081/: "Hubei Puts Its Focus on Improving the Management of Its Enterprises"/

/Text/ Guo Zhenqian /6753 2182 0051/, deputy secretary of the provincial party committee and acting governor of Hubei, stated at a provincial economic conference yesterday that the province should seek to improve the management of its enterprises in the industrial and communication battle lines in 1986 by improving their quality, reducing their wastage and heightening their efficiency.

Listing the poor quality of the products, the high rate of energy consumption and raw material wastage and low economic effectiveness of the enterprises as fatal flaws in the economic operations of the province, Guo Zhenqian stated that priority should be given to key products in our effort to improve the quality of our products and to reduce the consumption of energy and raw materials. In setting quality standards for our products, we must at the same time set a quota for energy and material consumption; in inspecting the quality of our products, we must also look into the consumption situation; in evaluating the quality of our products, we must at the same time assess the consumption quota. Thus, while assessing the quality of our products, we should also direct our efforts toward the production of first-rate commodities at the lowest rate of consumption.

While seeking to improve the quality of our products and to reduce consumption, we must also make a serious effort to improve the management of our enterprises. We must have a clear understanding of the need and a sense of urgency to improve the management of our enterprises, so that they may achieve a high standard, a high rate of efficiency and a large measure of staying power.

Stressing the importance of the principles of "consolidation, digestion, replenishment and improvement" and the "three reforms" (a combination of reform, remolding, and reorganization and integration) in production in the industrial and communication areas during 1986, Guo Zhenqian pointed out that the "three reforms" should be applied to the large and medium-sized enterprises without delay. In bringing about reforms, we must carry out the three provisional stipulations issued by the State Council for enhancing the vigor of the large and medium-sized enterprises by continuing to reduce their directive planning, permitting them to reduce prices to sell their outmoded and overstocked commodities and readjusting and reducing the readjustment taxes levied on some large and medium-sized enterprises to ensure their survival on a priority basis. In the remolding of the enterprises, major support should be given to the large and medium-sized enterprises, so that their products may achieve an advanced technical standard as soon as possible. In bringing about reorganization and integration, full use should be made of their technical and personnel advantage to strengthen their lateral economic contacts to facilitate the distribution of spare parts for the various commodities and to make it possible for them to engage in specialized production. It will thus be possible to give the local township and town industries a headstart and to enable the large and medium-sized enterprises to improve the quality of their products, to develop new products, and to achieve technical progress.

ECONOMIC MANAGEMENT

BRIEFS

EAST-WEST DEVELOPMENT COOPERATION URGED--Xian, May 16 (XINHUA)--Cooperation between China's energy-short east and the technologically backward west is urgently needed to further the development of the two major regions. At a conference now being held in this Shaanxi provincial capital, experts called for establishing a coordinating office to promote such cooperation. They drew special attention to the economic links among areas along the Longhai and Lanzhou-Urumqi railways that run through Jiangsu, Henan, Shaanxi, Gansu and Xinjiang and their surrounding areas, covering a two-thirds of the country's total area. According to the experts, 80 percent of China's coal reserves, 60 percent of its oil and natural gas, and 40 percent of its hydroelectric potential have been found in the western part of the country. Many Chinese and foreign economists agree that this area has great potential to become one of the Chinese economic centers in the 21st century. Chinese leaders Hu Yaobang and Zhao Ziyang have on many occasions called for closer cooperation between the eastern and western parts of the country. [Text] [Beijing XINHUA in English 1337 GMT 16 May 86 OW] /6662

SOUTHWEST COOPERATION--Kunming, May 20 (XINHUA)--Since agreeing to extend cooperation two years ago, five southwest China regions have over the past two years cast off the administrative divisions in a joint effort for economic progress. According to an economic coordination meeting which opened here today, Sichuan, Guizhou and Yunnan provinces, Guangxi Zhuang Autonomous Region and Chongqing City have signed agreements on 3,600 projects, 46 percent of which have already been implemented. Administratively, Chongqing is under the jurisdiction of Sichuan Province, but financially, it is independent of the province. With assistance from the central government, work is now under way to connect 14 regional highways to improve the southwest China road system, the meeting was told. In addition, they have also built a number of chemical plants and developed mines. At present, the authorities of the five localities are planning to further extend their cooperation in science, technology, culture and education. Encouraged by Chinese leaders Hu Yaobang and Zhao Ziyang, these resource-rich yet economically-underdeveloped localities decided to join hands in developing their economies in 1984. ABOLITION OF FOREIGN EXCHANGE CERTIFICATES POSES PROBLEMS

Hong Kong MING PAO in Chinese 11 Apr 86 p 17

[Article by Cai Junhua [5591 0193 5478], lecturer in the Economics Department, Hong Kong University: "Abolition of Foreign Exchange Certificates Poses a Multitude of Problems"]

[Text] The value of a country's currency stems principally from its exchangability, and the exchangability of currency has two principal aspects, as follows: First is its exchangability for other currencies, i.e., the degree of ease with which the currency may be exchanged for another currency. In addition is the exchangability for goods, i.e., the degree of ease with which the holder of a currency can exchange it for or use it to buy products from the country of issuance. If the exchangability of a country's currency for the currency or goods of another country is limited solely to the residents of the country, the currency is termed "internally" exchangable. If it is limited only to the residents of a foreign country, it is termed "externally" exchangable.

The "internal" exchangability of renminbi is not high, i.e., residents of China cannot readily convert renminbi into foreign currency. At the same time, it is also not easy to convert the renminbi one holds into the products one wants to buy. This is the main reason that China is a country that exercises centralized state control over foreign exchange, as a result of which residents are not permitted to convert foreign currency at will. At the same time, China is a country that practices a planned economy whereby the production, circulation, and consumption of very many commodities as well as the kinds and amounts of commodities imported and exported are planned. In order to insure plan realization, the state does not permit residents to buy commodities freely and as they please.

Black Market in Renminbi Arises in Response

After institution of the open door policy and the influx into China of a large number of foreign traders and tourists, if renminbi were to have the same very low exchangability for these people that it has for residents of China, i.e., renminbi being not only limited in exchangability internally but also externally, both aliens and compatriots from Hong Kong and Macao would find it difficult to convert foreign currency to renminbi or to convert their unused renminbi into foreign currency to be taken out of the country. At the same time, it is would also be very difficult to use the already converted renminbi to buy things in China. Thus, China's open door policy would be unable to make headway. Consequently, in order for China's open door policy to meet needs while simultaneously maintaining foreign exchange controls and the planning system intact, China,like socialist countries in eastern Europe, has had to maintain limitations on the internal exchangability of renminbi while at the same time carrying out fairly free exchangability of renminbi externally. The specific means for keeping these two kinds of exchangability separate are of two kinds, as follows: One is the method used by other socialist countries, namely, to permit use of foreign currency within the country, but restricting its use to foreign residents. To permit the circulation of foreign currency inside China seems to damage the sanctity of national sovereignty; therefore, China's method has been to issue yet another form of renmibi, namely foreign exchange renminbi, which is also termed foreign exchange certificates. These foreign exchange certificates are like foreign currency. Their exchangability is very high, and they differ only in that renminbi is used as the unit for figuring their value. These foreign exchange certificates may be used solely by foreign guests in order to keep domestic foreign exchange separate from the commodity market's "internal" and "external" exchangability.

Theoretically foreign exchange certificates may be used only by foreign guests and by compatriots from Hong Kong and Macao. In practice, however, it is very difficult to separate Chinese from foreign residents. As a result, foreign exchange certificates have come to be used by both Chinese and foreign residents alike. Since exchangability of foreign exchange certificates is higher than for renminbi, a black market in renminbi has risen in response. As a result, not only has speculation and profiteering been engendered to gain foreign exchange illegally, but national management of foreign exchange and export and import plans has come under attack as well.

Temporarily Difficult for Renminbi To Replace Foreign Exchange Certificates

In order to solve the problems that have been produced since the issuance of foreign exchange certificates, China recently announced intentions to abolish foreign exchange certificates, and to forbid the circulation of other foreign currencies at the same time, as well as its intention to make renminbi the sole currency in circulation in China. Abolition of foreign exchange certificates would serve a positive function in reducing black marketing of renminbi. Nevertheless, abolition of foreign exchange certificates could not complete wipe out the black market in renminbi, because abolition of foreign exchange certificates would not strike at the root causes for the black market in renminbi.

First of all, the main reason for existence of a black market in renminbi is the not very high exchangability of renminbi itself. Holders of renminbi hope to convert it into a currency of relatively high exchangability. Therefore, the best way to wipe out the supply of black market renminbi is to increase the internal exchangability of renminbi itself. As for increasing the exchangability of renminbi itself for other currencies and real goods, so long as a situation exists of foreign exchange supply being unable to meet demand not only would a tremendous lowering of the foreign exchange value of renminbi be required, but China would simultaneously have to abandon planned management of the production, consumption, exportation, and importation of major goods.

Clearly, it will be very difficult for China to meet these requirements during the next several years.

Second, if the internal exchangability of renminbi cannot be increased and foreign currencies are not permitted to be used in China, in order to maintain the external exchangability of renminbi so as to avoid increasing the inconvenience to foreign guests and so as to hasten the pace of the open door policy appropriately, China has no choice but to seek some other "circulation device" to replace the function that foreign exchange certificates serve. If this new "circulation device" administratively cannot attain being "limited solely to use by foreign guests," this new "circulation device" will turn into another target for renminbi black market exchange.

Therefore, though China has decided to abolish foreign exchange certificates, as a result of various circumstances, this has not materialized and it seems that this will be done will not occur during the next 1 or 2 years.

(Editor's Note: Chinese Communist plans to abolish foreign exchange certificates before 1990 has great ramifications. We have invited quite a few scholars who are well-versed on China's economy, and particularly on currency issues, and people in business circles to compose articles and analyze this problem for this newspaper. Mr Cai Junhua's work is the first of a series of special articles on this subject. Other articles will appear one after another in succeeding weeks, and it is hoped that readers will give attention to them. In addition, beginning next week, Free Forum will increase the number of times it is published, appearing on Monday through Friday for a total of 5 days each week.

FINANCE AND BANKING

REGULATIONS ISSUED ON RURAL CREDIT COOPERATIVES LOANS

Beijing NONGMIN RIBAO in Chinese 8 Apr 86 p 2

[Article: "Make Full Use of the People-to-People Lending Role of Credit Cooperatives. Person-in-Charge of the Credit Department of the Main Office of the Chinese Agricultural Bank Answers Correspondent's Questions on 'Rural Credit Cooperatives Provisional Methods For Controlling Credit'"]

[Text] On 28 February, the Main Office of the Chinese Agricultural Bank published "Rural Credit Cooperatives Provisional Methods for Controlling Credit," (hereinafter abbreviated as "provisional methods"). This was the first document issued since the founding of the People's Republic devoted to guiding the credit activities of rural credit cooperatives, and it brought to a close a history of credit cooperatives following the body of methods used by national banks. The correspondent interviewed the person-in-charge of the credit department of the main office of the Chinese Agricultural Bank on pertinent questions about these "provisional methods," asking him for replies to the following questions:

Who are the recipients of credit explicitly cited by the "provisional methods" and what are the requirements for obtaining loans?

Answer: The recipients of credit specifically cited by the "provisional methods" are contracting households, specialized households, and rural cooperative units engaged in farming, forestry, animal husbandry, sideline occupations, and fisheries; enterprises run by townships, villages, or households, and various forms of jointly operated enterprises or new economic partnerships (collectively designated partnerships, the same applying hereinafter) that conduct independent accountings with the approval of authorities concerned; rural cultural and educational, health, and scientific and technical entrepreneural units that derive income from their operations and can be counted on to repay funds; independent rural economic households and economic partnerships whom authorities concerned have authorized to engage in handicraft industries, businesses, transportation, construction, or the service trades.

Small loans to peasant households in general aside, all other applicants for credit must meet the following requirements: Contracting units (or households) must have contract agreements; joint economic organizations must have joint agreement documents; industrial, commercial, transportation, construction, and service units or individuals must also have business licenses or construction permits issued by industrial and business administrative units and be qualified as juridical persons. They must conduct independent accounting, be responsible for their own profits and losses, have sources of supply of raw materials, possess skills necessary for production, and have markets for their products. They must themselves be able to put up a proportional amount of funds required by regulations, and a method for sharing excess profits must be spelled out clearly. They must possess usable or salable materials and assets of a value equivalent to the amount of credit issued that can serve as security for a loan. When a unit or individual having requisite economic strength guarantees a loan and the entity guaranteed is unable to fulfill his contractual obligations to repay the loan, the entity that has guaranteed the loan will be held economically responsible for repayment. In addition, the lender must establish a savings account in a credit cooperative. The lender must regularly provide the cooperative with production plans and statements of financial earnings, accepting supervision and inspection by the credit cooperative.

In addition, cadres in national organizations and cadres and staff members in banks and credit cooperatives may not obtain loans from credit cooperatives.

What provisions does the "provisional methods" contain with regard to time limits and interest rates on loans?

Answer: Cooperatives may set the period of a loan in accordance with the production cycle of the trade to which the loan is made. The period of loans for production or of personal loans may not exceed 1 year at most, and loans for production equipment may not be for a period longer than 3 years. Loans must also be made on the basis of the overall ability of the borrowing unit to repay the loan, the amount of the loan to be repaid year by year and payment by payment being decided through discussion between borrower and lender. These terms are to be noted in detail in the lending agreement and are to be strictly adhered to.

Credit cooperatives may use nationally decreed basic interest rates as a basis for applying variable interest rates to loans. Variable interest rates may be set higher or lower depending on the social benefit derived from the endeavor for which the loan is issued, the amount of profit to be derived, ability to repay, and credit rating of the borrower. In some cases, the variable interest rate will be close to the market interest rate, the extent to which the interest rate varies and the limits of variation to be determined by individual credit cooperative branches. Credit cooperatives are to figure interest on loans to township and town enterprises quarterly; interest on all other loans is to be figured annually.

What are the limits on examination and approval authority and procedures for loans provided for by the "temporary methods"?

Answer: Credit cooperatives are to conduct rigorous examinations preliminary to approval, and are to adhere to a system of collective examination and approval for large loans. They are to carry out a policy of collection by the entity that makes the loan.

When a borrowing unit wants to make a loan, it must prepare a loan request. Before the credit cooperative issues the loan, it must conduct a feasibility study, selectively deciding which projects are to be supported. Only following level by level examination and approval within the limits of authority may the loan be granted. Loan procedures may be simplified where the period of the loan is short, the amount small, and the peasant household has a good credit rating. Once a loan agreement has been signed according to law, it has the force of law. Should either side want to change or abrogate the original agreement, it must notify the other party in writing at once. Until such time as this agreement takes effect, the original agreement remains in force.

Before a loan may be issued, item-by-item assessment and verification of sums must be made. Collective proof for loans to be issued to individuals, or individual proof for loans to be issued to collectives is inadmissible. Credit cooperatives are to make checks after issuing loans to insure that loans are being used properly.

In the issuance of loans, credit cooperatives are to institute a system for compliance when loans are due for repayment. Before a loan is due for repayment, the credit cooperative must issue a reminder to the borrowing entity. If the borrowing entity is temporarily unable to repay the loan, it must make a request for an extension to the credit cooperative 3 days before the loan is due for repayment. After approval has been issued, procedures for an extension of the loan period may be carried out. Extensions are to be controlled tightly, and may be granted only once. The maximum extension may not be longer than the period of the original loan.

Democratic management is to be practiced in the issuance of loans, with a bolstering of supervision by the masses. Credit cooperatives are to publicize regularly or irregularly, either orally or in writing, the status of loans for the information of commune members, and they must heed the suggestions and reactions of the masses. They are also to conduct analytical studies to propose actions for improvement. They are also to set up files on borrowers to improve management of loan funds.

What provisions do the "temporary methods" contain on punishment of those who violate credit discipline?

Answer: Should any entity use funds for purposes other than those prescribed in a loan agreement or receipt for a loan, the credit cooperative has authority to recover all or part of the loan. When funds are used in violation of agreements or not in accordance with the period of time stipulated in an agreement, an interest penalty amounting to 50 percent of the agreed upon interest rate is to be imposed for the amount of funds thus used. In serious cases, issuance of new loans may be halted for a fixed period of time. Should loans fail to be repaid when due and no extension has been requested, a penalty interest based on the original interest rate is to be paid on the portion in arrears. In addition, credit cooperatives are empowered to garnishee loan funds from the savings accounts of borrowers as well as to take over their property. When loans are used for illegal activities, such funds are to be recovered at once and penalty interest payments collected as well. Serious cases are to be reported to judicial institutions for disposition.

Credit cooperatives that do not provide loans for the period of time and the amount stipulated in agreements are to pay interest penalties in accordance with the interest rates stipulated in the agreements and for the period of time that such agreements have been violated.

FOREIGN INVESTORS ATTRACTED BY TAX BENEFITS

OW170838 Beijing XINHUA in English 0639 GMT 17 May 86

[Text] Beijing, May 17 (XINHUA)--China will continue to offer foreign investors generous tax conditions in the future in a bid to attract more foreign funds.

Since the law on income tax for joint ventures using Chinese and foreign investment was passed in 1980, China has published several detailed regulations concerning taxation of foreign investors.

In coastal cities and regions open to the rest of the world, the normal 30 percent rate of income tax on company earnings has been halved to 15 percent for firms introducing much-needed advanced technology.

The 15 percent rate is also applied to enterprises backed by foreign investment of more than 30 million U.S. dollars and those who require long periods to recover investment.

And all enterprises backed by foreign investment in special economic zones enjoy the 15 percent tax rate, which can also apply to energy and transport ventures, according to an official of the state taxation administration.

Outside economic zones, enterprises solely backed by foreign investment are taxed at between 20 and 40 percent according to their level of investment.

These measures, introduced in late 1984, have been effective in encouraging foreign investors to China, the official said.

By the end of last year, the number of Sino-foreign joint ventures amounted to more than 3,700, and there were 120 enterprises backed solely by foreign investment. There were 1,500 representative offices of more than 520 foreign firms in China.

Deals involving direct foreign investment signed between 1980 and 1985 were worth 1.7 billion U.S. dollars. The official added that still greater effort was needed to tap the potential of banks to make more rational use of foreign funds.

BRIEFS

PERSONAL FOREIGN CURRENCY SAVINGS UP--Beijing, May 16 (XINHUA)--China's personal foreign currency savings have reached the equivalent of more than 200 million U.S. dollars, a 20 percent increase over the figure for the end of last year, according to INTERNATIONAL BUSINESS. South China's Guangdong Province ranks first as regards the amount of personal foreign currency savings. Beijing and Shanghai municipalities and Fujian Province come close behind, said the paper. Such savings are useful for investment in Sino-foreign joint ventures, technical retooling of enterprises, and boosting production for export, the paper noted. INDUSTRY

XINJIANG DOUBLES LIGHT INDUSTRY OUTPUT VALUE

Urumqi XINJIANG RIBAO in Chinese 22 Jan 86 p 1

/Article by reporter Liu Xiaofeng /0491 2556 7364/: "Light Industry in Xinjiang Region Triumphantly Doubles Its Output Value; Output Value and Tax for Profit in 1985 Increase 111 Percent and 136.7 Percent, Respectively, Over 1980 Fulfilling 1990 Tax for Profit and Output Value Plans 5 Years Ahead of Schedule"/

/Text/ Designated professions and trades under light industry in the Xinjiang Autonomous Region realized output value of more than 950 million yuan in 1985, an increase of 111 percent over 1980, showing an average annual increase of 16.2 percent. By the end of 1985, the tax for profit materialized came to more than 220 million yuan, which represents an increase of 136.7 percent over 1980 and an average annual increase of 18.8 percent. Light industry's output value of tax for profit was coubled over 1980, thus fulfilling the 1990 plan 5 years ahead of schedule.

During the Sixth 5-Year Plan, Xinjiang's light industry developed more than 830 new products and varieties; there was a marked increase in the output of products such as beverage, wines, canned goods, cigarettes, dry battery cells, powdered soap, and many other consumer goods for daily use, whose output had doubled and redoubled. The quality of products had also improved noticeably, with 73 appraised by pertinent central departments and the autonomous region as quality products. Their excellent achievements are attributable to the following:

—The implementation of the economic responsibility system from top to bottom, with every level committed thereby to solving the problems of having workers and staff members eat from the same big pot of enterprises and enterprises eat from the same big pot of the state, and greatly reducing the number of enterprises of light industry in the Xinjiang region operating at a loss.

—Conscientious implementation of the policy of opening to the outside and vigorous pursuit of the work of importing from abroad and cooperating with units in the interior. During the Sixth 5-Year Plan, 19 items were imported from abroad, most of which had been put into operation and achieved results; there were also more than 300 projects of economic cooperation with fraternal provinces, municipalities, and areas in the country, thereby bringing about some changes in the shoddy processing of substantial materials by Xinjiang's light industry enterprises and markedly improving economic results.

—Exploiting the advantage of local resources, following the road of developing light industry by the state, collectives, and individuals, extensively absorbing idle funds in society and giving priority in developing food, leather, paper, plastic, clothing, and packing industries and items of specially needed by national minorities.

CHINA'S LIGHT INDUSTRY DEVELOPMENT TARGETS SET

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 4 Mar 86 p 1

/Article by reporters Li Qian /2621 5409/ and Li Hexin /2621 0735 0207/: "China's Light Industry Sets Development Targets; Considerable Progress Will Be Made in Food, Clothing and Durable Consumer Goods During Seventh 5-Year Plan"/

/Text/ It is learned from the national conference of light industry department and bureau directors which opened on 3 March that considerable progress will be made during the Seventh 5-Year Plan in the production of food, clothing, durable consumer goods, paper, salt-processing, synthetic detergents, plastic products, photosensitive materials, leather and hides, furs and related products, art, craft, and interior decoration items, cultural and educational articles and sports goods, articles for national minorities, and various types of small commodities by light industry to cope with the national economic development and the people's needs for basic articles for daily use.

Light industry is responsible for supplying consumer goods which account for more than one-third of the purchasing power in society. This is especially true during the Seventh 5-Year Plan when the people's consumption pattern, the consumption structure, and the consumption concept will be changing. The range of consumption of people in urban and rural areas will also expand with each passing day and the level of consumption will rise repeatedly. All this calls for new progress in both quantity and quality in the production of consumer goods at home.

It is understood that during the Seventh 5-Year Plan the state will increase a certain amount of investment for developing production in the light industry system and plan to continue construction on 25 large and medium projects and 44 new projects and totally integrated subsidiary projects for 7 production lines to produce beer, clothing, paper, canned goods, beverages, glass vases and containers, and leather. The productive capacity of a number of products, such as paper, sugar, beer, and beverages is expected to increase greatly. In spite of all this, a certain gap still remains between light industrial development and the rise of living standards.

The conference emphasized that to enhance the productive capacity of certain products in short supply and boost capacity to ensure continuous growth of light industry, it is imperative to arrange for a certain number of capital construction projects. However, we should never aim only at expanding the scale of capital construction in developing light industry. We must be aware that many enterprises have conspicuous problems characterized by high material consumption, low labor productivity, and poor economic results, thus making it more pressing and realistic for us to get on with technological transformation of existing enterprises and to publicize modern management. Moreover, we should pursue reform constantly and steadily, invigorate more than 1,000 large and medium enterprises in priority, and improve measures for reforming small enterprises, including those that have been put into effect in state and collectively owned enterprises. Except for a handful of light industry products bearing on the national economy and the people's livelihood that are under state control, we should adequately decontrol the prices of light industry products, especially those of small commodities, and gradually harmonize the price system. We should further develop lateral economic ties, exercise stringent control over professions and trades, organize transregional and transdepartmental enterprise groups is various forms and scale, and enhance the competitiveness of products in the domestic and world market with "hot-selling" goods as the lead and by relying on backbone enterprises.

SHAANXI HOLDS MEETING TO BOOST INDUSTRIAL PRODUCTION

HK221544 Xian Shaanxi Provincial Service in Mandarin 2330 GMT 21 May 86

[Text] Yesterday afternoon [21 May], the provincial government held an on-the-spot meeting on directing industrial production, demanding that all staff members and workers on the industrial and communications front throughout the province work hard to contribute more to the fulfillment or overfulfillment of the quotas for production for the first half of this year.

In his speech at the on-the-spot meeting, Zeng Shenda said: Industrial production and communications in our province rose and fell in the first 4 months of this year. The salient problem was that development was uneven and speed less than ideal. To fulfill the quotas for production for May and June, we must now pay attention to grasping the following several aspects of work well:

1. In national defense, it is necessary to vigorously produce military articles, to develop articles for civilian use, and to make up for the shortfall in output. The units which fulfill their quotas relatively well must be rewarded. The leadership groups which bungle the chance and adversely affect the progress of production must be promptly readjusted and existing problems solved.

2. It is essential to vigorously grasp production in the key places and key trades and production of the key products. Three cities, Tongchuan, Xianyang, and Xian must take measures to alter the passive situation. Apart from the national defense industry system, the four key trades, including petrochemical industry, coal industry, textile industry, and electronics industry, must firmly grasp the weak links and promote the development of production. All departments and prefectures must regard the items which have big production runs and which are marketable as the key point and expand production and increase output through cooperation or by creating favorable conditions. Regarding the newly-built projects and modified projects which will soon be put into operation or which have partly been put into operation, we must step up winding up on the one hand and on the other hand, carry out careful organization and make very good preparations for putting them into operation in order to ensure that these projects work successfully on their first test run and will be put into operation at an early date.

3. It is imperative to strengthen sales ability and to enliven sales activities. Some sales people can be suitably rewarded. The departments of finance, audit, and tax and banks must support enterprises' rational sales, provide service, and facilitate the development of enterprises' production.

4. It is necessary to relax the policy of loans and to guarantee the supply of materials. All prefectures, cities, and industrial departments must strengthen coordination with the banks and material departments, and make good arrangements for the issuing of loans and for the supply of materials.

5. It is essential to really strengthen leadership over the organization of industrial production. The provincial government has organized a group for grasping industrial production in the whole province, held regular meetings, and grasped this work thoroughly. All prefectures, cities, and industrial departments must also take certain measures to strengthen leadership over the organization of industrial production.

At the meeting, the state-run (Huashan) Machinery Plant and Northwest First Printing and Dyeing Mill respectively introduced their experiences in persisting in reform and strengthening management.

BRIEFS

FRG-SHANGHAI JOINT AUTO VENTURE--Beijing, May 17 (XINHUA)--The Shanghai Volkswagen Corporation, a joint venture between China and the Federal Republic of Germany, produced 1,564 cars during the first three months of this year, today's PEOPLE'S DAILY reported. The biggest joint venture in China's automotive industry produced 1,733 "Shanghai-Santana" cars in 1985, the first year of the corporation's operation. The factor is expected to produce 8,000 Santana cars by the end of this year, the paper said. The 1990 target is to produce 300,000 cars and 500,000 engines annually, when technical revamping and the renovation of workshops is completed, it said. SMALL-SCALE ENTERPRISES

HUNAN PLEDGES DEVELOPMENT OF TOWNSHIP, TOWN ENTERPRISES

Changsha HUNAN RIBAO in Chinese 21 Feb 86 p 1

/Article by commentator: "Hunan Pledges Unremitting Efforts To Develop Its Township and Town Enterprises"/

/Text/ The development of township and town enterprises in Hunan has been speeded up in recent years. The gross income of township and town enterprises in 1985 came to 9.5 billion yuan, showing an increase of 47.5 percent compared to the previous year. The development of township and town enterprises has served effectively to promote the readjustment of the structure of rural industries, the employment of surplus labor in rural areas, the development of commodity production, the establishment of small cities and towns in the rural areas, the development of lateral economic relations between the cities and rural areas, and the establishment of spiritual civilization in the rural areas. Numerous instances point to the fact that the development of township and town enterprises is essential to the invigoration of the rural economy and the doubling of agricultural production.

While the overwhelming majority of our comrades favor the development of township and town enterprises, there are those who hold different views.

Some comrades feel that township and town enterprises are being developed at too rapid a pace and that it should be reduced to avert the creation of shortages in various areas. It is true that township and town enterprises developed at a high rate of speed in 1985 and that certain businesses were developed in a haphazard manner. Generally speaking, however, these enterprises have been developed in a proper and healthy way and not at an excessive rate of speed. Although the township and town enterprises in our province had an early start, they have been slow in long-term development and have a weak foundation, so that their potential is considerable. Compared to the more advanced provinces and cities, our province still lags far behind. For instance, the gross production value of the township and town enterprises in our province came to only one-fourth of that of Jiangsu and less than half of that of Zhejiang. Furthermore, the township and town enterprises in our province are being developed at an uneven rate. While the production value in some counties and cities has exceeded 400 million yuan, that of most counties and cities is only in the millions or 10 millions. That goes to show that we are correct in promoting the healthy development of our township and town enterprises instead of adopting a negative attitude and relaxing our efforts. Most of the existing township and town enterprises in our province are of the labor-intensive type involving little capital construction and small amounts of investment. They tend to yield rapid results and to call for the consumption of a large amount of live labor and a relatively small amount of materialized labor. With the strengthening of macroeconomic control, the shortage of funds and energy resources is not likely to be exacerbated.

Some comrades put the blame for the reduction of grain production in our province last year on the excessive speed in the development of township and town enterprises. This view is entirely without justification. The reduction in grain production in our province last year was due to a number of factors. First, it was a result of serious natural disasters; second, it was due to the reduction in the acreage for grain production resulting from the readjustment of the industrial structure in the rural areas; third, it was a result of the relaxation of leadership in agricultural production in certain areas. All these factors have nothing to do with the development of township and town enterprises. On the contrary, the development of township and town enterprises has increased the value derived from the processing of many agricultural sideline products, offered greater incentive to the peasants to engage in planting and breeding operations, increased the income of the peasants and collectives and contributed to the stable increase in agricultural production by making use of the industries to promote agriculture. If the township and town enterprises had not been developed to compensate for losses in agricultural production last year, greater difficulties would have surfaced this year.

Pointing to the many problems plaguing the township and town enterprises, some comrades have expressed certain doubts regarding their development. It cannot be denied that certain problems do exist in the development of township and town enterprises. For instance, some enterprises tend to rush headlong into production in a haphazard manner; some inefficient enterprises produce commodities of poor quality and at high cost; some incur a high rate of accidents and contribute to the pollution of the environment. These problems must be properly dealt with instead of being swept under the carpet. However, these problems have emerged while progress is being made and are incidental to the development of township and town enterprises which, after all, are something new. Due to the lack of experience and the slow dissemination of information, such problems are to be expected in the process of development. We would be indulging in fantasy and ignoring realities not to expect the emergence of certain problems. What we should do is to dedicate ourselves to helping the township and town enterprises to benefit from their experience, to overcome their shortcomings and to resolve their problems.

It is incumbent upon those in party and administrative leadership positions in various areas and the concerned departments to regard the development of township and town enterprises as a development of a strategic nature and as an important item on the agenda, to implement conscientiously the basic policy of developing township and town enterprises set by the central and provincial governments, to render active support to the policy, to engage in proper planning, to provide sound leadership, to strenthen their control, and to render wholehearted service so that township and town enterprises may be developed in a sustained and healthy manner.

BEIJING TO REDUCE CAPITAL CONSTRUCTION SCALE

HK161045 Hong Kong ZHONGGUO XINWEN SHE in Chinese 1014 GMT 14 May 86

[Text] Beijing, 14 May (XHONGGUO XINWEN SHE)--Beijing Municipality will reduce the scale of capital construction by a big margin this year. The construction area will be reduced from some 40 million square meters, which was originally planned by various departments at the beginning of this year, to about 23 million square meters.

In his report submitted for approval to the municipal people's congress, Beijing Mayor Chen Xitong said: An excessive scale of capital construction will further aggravate the city's shortage of land and building materials. He hoped that various central departments and army systems in Beijing would understand and support Beijing's measures in reducing the scale of capital construction.

A group for examining construction projects, composed of specialists and departments concerned, is examining and readjusting major projects and projects involving foreign capital. It is expected that the construction of a number of guesthouses and office buildings will be canceled or postponed.

Wang Jun, chairman of the municipal planning committee, said: The construction of infrastructure for water supply, power supply, communications, and so on will be given priority. The construction of seven restaurants and hotels which involve foreign capital, including the guesthouse of Beijing Restaurant which involves the capital of Hong Kong businessmen, will not be affected by the reduction of the scale of capital construction. The construction of residential houses will maintain a relatively high pace. It is expected that 4.5 million square meters of residential houses will be completed by the end of this year.

CONSTRUCTION

AERONAUTICS INDUSTRY BUILDING LARGE AUTOMOBILE BASE

Beijing ZHONGGUO JIXIE BAO in Chinese 18 Mar 86 p 1

/Article by reporter Ge Yunchi /5514 6663 3069/: "Construction of One of China's 10 Largest Automobile Bases Has Started in Aeronautics Industry; During the Seventh 5-year Plan Period, It Will Have the Capacity To Produce 100,000 Minicars and 140,000 Engines Annually and a National Center of Automobile Industry Models Will Also Be Built"/

/Text/ The construction of a minicar production base is being arranged with the Harbin Aircraft Manufacturing Plant of the Ministry of Aeronautics Industry, the Andong Machinebuilding Plant, and the Jingdezhen Changhe Aircraft Manufacturing Plant as the main body, it will be shaped into a capacity for production of 100,000 minicars and 140,000 engines annually. This base will be China's largest minicar production base after Tianjin and also one of China's 10 largest automobile industrial bases.

China's aeronautics industry is clearly related to its automobile industry. In many respects, they have similar production equipment and manufacturing processes, and many qualified people in the aeronautics industry came from the automobile industry; in addition, the aeronautics industry's enterprises also engaged in the production of automobiles in the past. All this has laid favorable conditions for departments of the aeronautics industry to develop the automobile industry.

Since the 3d Plenum of the 11th CPC Central Committee, in compliance with the state unified planning and guided by the principle of "ensuring military needs while shifting toward civilian production and integrating military with civilian production," the Ministry of Aeronautics Industry has decided to import from a Japanese company advanced 1980's-level model cars and technology and arranged for the construction of a minicar production base. After more than 5 years of hard work, a minicar production base with the Harbin Aircraft Manufacturing Plant, the Andong Machine-Building Plant, and the Jingdezhen Changhe Aircraft Manufacturing Plant as the main body and composed of more than 200 transdepartmental and transprovincial, and transtrade factories has emerged in embryonic form. The 0.6-ton Songhuajiang Brand minitrucks and the Changhe Brand bakery minitrucks they have developed passed the state apprasial in October 1985, reaching the level of the Japanese models. By the end of 1985, these factories had produced more than 5,600 minicars and more than 13,000 engines, attaining the level of producing more than 80 percent of the cars entirely at home.

At the moment, the technological transformation plan of the minicar production base of the Ministry of Aeronautics Industry has been listed as a key state project of technological transformation during the Seventh 5-Year Plan period. The approved first-phase project to be completed by 1987 will have a capacity of producing 100,000 automobiles and 140,000 engines annually.

Recently, the Ministry of Aeronautics Industry signed a joint investment agreement with the China Automobile Industrial Corp. and the pertinent enterprises of these two units. By taking full advantage of the superior designing by the large-sized computer, drafting machine, and measuring machine of the departments of the Aeronautics Ministry and on the basis of the superior manufacture by high-precision machine tools such as the data control and processing center, methods and equipment for measuring and testing will be increased and improved and a technological transformation will be made. A national automobile industry model center will be established by the end of 1988.

XINJIANG LEADERS ATTEND PETROCHEMICAL PLANT OPENING CEREMONY

HK021325 Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 1 May 86

[Excerpts] The construction project of the Zepu petrochemical plant was started today in a petroleum base in southern Xinjiang. The project is a key project of the CPC Central Committee and the State Council to support and develop the region.

Wang Enmao, vice chairman of the CPPCC and chairman of the regional advisory commission; Li Tianxiang, vice minister of petroleum industry; Jiao Liren, advisor; Song Hjanliang, Tomur Dawamat, Janabil, (Tan Guangcai), Huang Baozhang, (Chailichimu Silamu), Bai Chengming, (Jin Yinghui), and Chen Shi, leaders of the regional party, government, military, and corps, attended the opening ceremony for the construction of Zepu petrochemical industrial plant project.

Also present were responsible comrades of the regional administrative bureau for the petroleum industry; Kashi, Hotan, and Kizilsu prefectures and autonomous prefectures; as well as over 5,000 people from places across the country, who are participating in the construction project.

The opening ceremony was presided over by Huang Baozhang, vice chairman of the region. Tomur Dawat, deputy secretary of the regional CPC committee and regional chairman, delivered a speech at the ceremony.

He said: The CPC Central Committee and the State Council are paying much attention to the building of the region, as well as the region's people of various nationalities. Now, the construction of the Zepu petrochemical industrial plant project has resulted from the attention paid to the region by the CPC Central Committee, the State Council, and other departments concerned, including the Ministry of Petroleum Industry. The leadership and departments concerned at various levels in the region, as well as various trades, must fully understand the significance of the project. They should spare no effort in supporting this project in terms of manpower, material, and financial resources, so as to strive to complete it and put it into operation by 1 May 1989.

Li Tianxiang, vice minister of petroleum industry, spoke at the ceremony. He said he will try his best to support the construction of the project, so as to contribute to putting an end to the backward situation in the area sooner.

As music played, Wang Enmao, vice chairman of the CPPCC and chairman of the regional advisory commission; and Jiao Liren, advisor to the Ministry of Petroleum Industry, cut the ribbon for the construction of the Zepu petrochemical plant project.

NEW SHIPS BERTHS IN LIAONING--Shenyang, May 14 (XINHUA)--Liaoning Province in northeast China is to build 26 new ship berths during the seven five-year plan period (1986-1990), with a capacity of handling more than 20 million tons of goods annually. As a result, the province's handling capacity will go up to 63.7 million tons a year when the construction is completed. There are four large harbors, including Dalian harbor, the second-largest in the country, in Liaoning Province, which is an important industrial region and the communications channel to Jilin and Heilongjiang provinces, and the Inner Mongolia Autonomous Region. The development of shipping berths will be centered on Dalian harbor and include Dandong, Yingko and Jingzhou harbors. China is to build 100 deepwater berths with a capacity of over 10,000 tons of cargo per year each during this period, of which 20 will be set up in the province. In addition, of 80 medium and small berths to be constructed throughout the country, 16 will be built in Liaoning. Already under way are the construction of three berths with a total capacity of 9,000 tons a year--one in Dalian, and two in Yingko. They will be completed within this year. Meanwhile, the construction of another four berths wih a total capacity of 14,000 tons is due to start in Dandong city. [Text] [Beijing XINHUA in English 0553 GMT 14 May 86 OW] /6662

HEILONGJIANG GOVERNOR MEETS JAPANESE ECONOMIC DELEGATION

SK170538 Harbin Heilongjiang Provincial Service in Mandarin 0900 GMT 15 May 86

[Excerpts] The Japan's Hokkaido Prefectural economic delegation, headed by (Suzuki Shigeru), president of the (Pozhi) Bank of Hokkaido, called on the provincial government this morning. Governor Hou Jie met with all members of the delegation and made a friendly and warm speech.

Governor Hou Jie said: Heilongjiang Province and Hokkaido Prefecture are similar in terms of natural resources and geographical conditions. With a good foundation for conducting cooperation, we believe that the visit of the delegation will certainly promote and develop the friendly cooperation and exchanges between the province and the prefecture in the economic, scientific and technological, and cultural fields. Since last August, more and more Japanese friends, in particular, the friends from financial and industrial circles in Hokkaido Prefecture, have visited our province to conduct economic and technological cooperation and trade talks. I shall lead a Heilongjiang provincial delegation to visit your country in the near future and to formally sign a protocol on establishing friendly relations between the province and the prefecture. And then, the friendship between Heilongjiang and Hokkaido will enter a new stage of development.

The Hokkaido Prefectural economic delegation, headed by (Suzuki Shigeru), president of the (Pozhi) Bank, is composed of the members of 14 enterprises and limited companies in the banking, agricultural, forestry, aquatic produects industry, and farm machinery fields. The delegation arrived in Harbin City on the morning of 14 May. During its stay in Harbin, the delegation will hold talks with our province on the issues of developing bilateral trade, economic, and technological cooperation.

Governor Hou Jie will host a banquet for all members of the delegation in the (Huayuancun) Guesthouse this evening.

TEXT OF CHINA COUNCIL REGULATIONS

HK150342 Beijing RENMIN RIBAO in Chinese 5 May 86 p 2

["Regulations of the China Council for the Promotion of International Trade"]

[Text] Chapter I .

General Provisions

Article 1. The China Council for the Promotion of International Trade, that is, the China Chamber of Commerce for Foreign Trade [Zhong Guo Dui Wai Shang Hui 0022 0948 1417 1120 0794 2585], is called Chinal Council for Promotion of Trade [Zhong Guo Mao Cu Hui 0022 0948 6319 0191 2585] for short.

Article 2. The China Council for Promotion of Trade is a nationwide non-governmental organization dealing with foreign economic relations and trade, which is formed of representative figures, enterprises, associations, and organizations of the Chinese economic and trade circles.

Article 3. The purpose of the China Council for Promotion of Trade is to boost foreign trade, make use of foreign capital, introduce advanced technology from foreign countries, promote economic and technological cooperation in various forms with foreign countries, expedite the development of international ties in the trade, economic, and technological fields, and enhance mutual understanding and friendship between the Chinese people and all peoples in the world and between the Chinese and foreign economic and trade circles, in accordance with the policies, laws, and decrees of the PRC Government.

Article 4. The China Council for Promotion of Trade is a corporate body which, in its capacity, is entitled to sign with its foreign counterparts agreements, protocols, and other documents at the non-governmental level with a view to promoting trade and economic and technological cooperation.

Article. 5. The China Council for Promotion of Trade is sited in Beijing.

Article 6. Branches of the Council for Promotion of Trade shall be set up in provinces, autonomous regions, municipalities, and cities separately listed in the state plan of the PRC; and sub-branches shall be set up in cities under the jurisdiction of provincial and autonomous regional governments.

Chapter II

Functions

Article 7. The functions of the China Council for Promotion of Trade are:

1. To carry out investigations and studies, provide Chinese and foreign enterprises and organizations concerned with information and consultative service relating to trade and economic and technological cooperation, introduce partners for cooperation, and make efforts to promote foreign trade, to make use of foreign capital, to introduce advanced technology, and to initiate technological transformation projects in enterprises.

2. To make efforts to strengthen ties with the economic and trade circles of all countries, invite individuals, as well as delegations, from foreign economic, trade, and technological circles to visit China, take charge of entertaining them, and organize tours for delegations and study groups of the Chinese economic, trade, and technological circles to visit foreign countries.

3. To develop ties with foreign chambers of commerce, economic and trade associations, and other international economic and trade organizations, join international economic and trade organizations or participate in their activities, keep in touch with the Beijing offices of foreign industrial and commercial organizations which are the foreign counterparts of the China Council for Promotion of trade, and when necessary, commission permanent representatives or set up representative organs abroad.

4. To participate in, organize, or cosponsor with its foreign counterparts international conferences concerning international economic affairs and trade.

5. To encourage and help Chinese enterprises and organizations relating to foreign economic relations and trade to host abroad economic and trade exhibitions or to participate in international expositions, and act as their coordinator in these activities.

6. To arrange for foreign parties to hold economic, trade, and technological exhibitions in China, sponsor multinational exhibitions and international expositions, act as the coordinator for the Chinese parties concerned in entertraining their foreign counterparts which hold economic, trade, and technological exhibitions in China, and establish and manage the China International Exhibition Center.

7. To promote and organize technological exchanges between China and foreign countries, and take charge of collection, distribution, display, and

exhibition of catalogues and samples of foreign new products as well as various foreign scientific and technological publications.

8. To provide service with regard to foreign economic relations and trade and maritime legal affairs, accept and hear cases of general and particular average adjustment, issue certificates of origin for products exported from China and certificates of force majeure, and sign, issue, and endorse documents relating to foreign trade and freight service.

9. To act as authorized agent of clients in applying for patent and trade mark registration, provide consultative service regarding industrial property right and trade of technology, and assist in handling disputes concerned.

10. To publish and distribute related journals and books, organize economic and trade symposiums, present China's principles and policies relating to and development in economic construction and foreign economic relations and trade, provide information on import and export commodities, and promote exchange and cooperation with foreign promotion and publishing organizations relating to the economic and trade circles.

11. To guide the branches of the China Council for Promotion of Trade in their operation.

12. To handle other affairs with a view to promoting economic relations and trade.

Chapter III

Membership

Article 8. The China Council for Promotion of Trade is composed of individual members, enterprise members, and corporate members:

1. Individuals, scholars, and researchers engaging in foreign economic relations and trade can join the China Council for Promotion of Trade as individual members;

2. Enterprises relating to foreign economic relations and trade can join the Council as enterprise members; and

3. Organizations, bodies, associations, and academic institutions relating to foreign economic relations and trade can join the Council as corporate members.

Article 9. Branches of the Council for Promotion of Trade set up in provinces, autonomous regions, municipalities, and cities separately listed in the state plan of the PRC are ex-officio members of the China Council for Promotion of Trade.

Article 10. A member has the following rights:

1. The right to vote, to elect, and to stand for election;

2. The right to make suggestions on and to supervise the work of the China Council for Promotion of Trade;

3. The right to participate in the activities concerned of the China Council for Promotion of Trade; and

4. The priority of enjoying the service and assistance rendered by the China Council for Promotion of Trade.

Article 11. A member shall perform the following obligations:

1. To observe the regulations of the Council;

2. To assist in and undertake the work assigned by the China Council for Promotion of Trade; and

3. To pay membership dues (individual members are exempt from the payment of membership dues).

Chapter IV

Organization

Article 12. The highest organ of power of the China Council for Promotion of Trade is the members' representative assembly, with the committee of the assembly as its standing body.

Article 13. The members' representative assembly is to be convened once every 5 years by the committee of the assembly. An interim members' representative assembly shall be convened when the committee deems it necessary. Two-thirds of the representatives will form a quorum for a members' representative assembly.

Article 14. The functions of the members' representative assembly of the China Council for Promotion of Trade are:

1. To fix the working guidelines, tasks, and plans;

2. To examine and adopt work reports submitted by the committee;

3. To discuss important matters concerned and formulate resolutions;

4. To ratify and revise the regulations of the China Council for Promotion of Trade; and

5. To elect the committee.

Article 15. The committee is elected for a term of 5 years. It must meet at least once a year, and one-half of the committee members will form a quorum for a committee meeting.

Article 16. The duties of the committee are:

1. To implement resolutions adopted by the members' representative assembly and be accountable to it;

2. To nominate the honoary chairman of the China Council for Promotion of Trade;

3. To elect the chairman and vice chairman of the Council;

4. To engage special advisers;

5. To examine and ratify work reports submitted by the chairman;

6. To examine and approve the annual financial plan and the final accounting of revenue and expenditure;

7. To make decisions on the establishment, modification, and abolishment of any functional bodies;

8. To guide and coordinate the branches of the Council in their operation and activities;

9. To examine and approve applications for membership; and

10. To convene regular or interim members' representative assembly.

Article 17. The chairman takes charge of day-to-day work of the China Council for Promotion of Trade and the calling of committee meetings. He exercises leadership over the operation of the Council and signs agreements and documents concerned on behalf of the Council. The vice chairman assists the chairman in his work. When the chairman is absent, a vice chairman shall function in an acting capacity. The term of office for both chairman and vice chairman is 5 years.

Chapter V

Financial Affairs

Article 18. The China Council for Promotion of Trade is financially independent and owns private properties. It is entitled to establish, whenever there is a need, enterprises which practice independent economic accounting and enjoy the status as corporate bodies.

Article 19. The China Council for Promotion of Trade raises its funds from the following sources:

1. Membership dues paid by members;

2. Revenue arising from provision of various services;

3. Donation from enterprises;

4. Subsidies from the government; and

5. Other income.

Article 20. The fiscal year of the China Council for Promotion of Trade begins on 1 January and ends on 31 December.

Chapter VI

Branches

Article 21. The branches of the China Council for Promotion of Trade set up in provinces, autonomous regions, municipalities, and cities separately listed in the state plan of the PRC are local non-government organizations dealing with foreign economic relations and trade formed of representative figures, enterprises, associations, and organizations of local economic and trade circles.

Article 22. The purpose of the branches of the China Council for Promotion of Trade is to boost foreign trade, make use of foreign capital, introduce advanced technology from foreign countries, promote economic and technological cooperation in various forms with foreign countries, expedite the development of ties of their own provinces, autonomous regions, municipalities, and cities separately listed in the state plan with foreign countries in the trade, economic, and technological fields, and enhance mutual understanding and friendship between local people and all peoples in the world and between the local and foreign economic and trade circles, in accordance with the policies, laws, and decrees of the PRC Government.

Article 23. A branch of the Council for Promotion of Trade is a corporate body which is entitled to formulate its own regulations in light of the regulations of the Council for Promotion of Trade, to operate on its own, and to sign agreements, protocols, and other documents at the non-governmental level with a view to promoting trade and economic and technological cooperation.

Article 24. A branch of the Council for Promotion of Trade implements its own financial plan. It is entiteld to acquire properties and undertake obligations in its own name. It is entitled to establish in its own province, autonomous region, municipality, or city separately listed in the state plan, whenever there is a need, enterprises which practice independent economic accounting and enjoy the status as a corporate body.

Chapter VIII

Artibration Bodies

Article 25. A foreign economic relations and trade arbitration committee shall be set up under the China Council for Promotion of Trade to arbitrate cases with regard to foreign economic relations and trade.

Arttiele 26. A Maritime Arbitration Committee shall be set up under the China Council for Promotion of Trade to arbitrate maritime cases.

Chapter VIII

Supplementary Articles

Article 27. Whenever there is a need, other organizations shall be set up under the China Council for Promotion of Trade, with the approval by the Committee of the Council.

Article 28. The regulations shall come into force on 4 May after having been discussed and adopted by the members' representative assembly of the China Council for Promotion of Trade.

MINISTRY OFFICIAL VIEWS PLANS TO BOOST FOREIGN COUNTER TRADE

HK130717 Beijing CHINA DAILY in English 13 May 86 p 1

[Article by Zhu Ling]

[Text] A major effort is being made this year to boost China's foreign counter trade.

The move should intensify economic cooperation between China and Third World countries as well as diminishing the trade imbalance with some developed nations, according to a senior official of the Ministry of Foreign Economic Relations and Trade.

Assistant Minister Zhu Youlan said: "In view of the serious shortage of hard currency in many countries, we can use counter trade to expand our overseas business, exporting our products in exchange for goods that are needed by our industries and consumer markets."

Zhu said that China's counter trade basically fell into three categories--barter, counter-purchase and compensation trade.

She explained that barter trade involved the exchange of goods of equal value without any money changing hands. Counter-purchase refers to a form of cash transaction whereby one trade partner buys goods from another country for money on the understanding that that country will buy back a certain amount of goods.

Compensation trade, she said, means that an importer can pay for equipment with goods produced with that imported equipment.

The assistant minister told CHINA DAILY that the ministry had been encouraged to develop counter trade by the current wave of such business sweeping the rest of the world.

Nearly 90 countries were involved in counter trade in 1984 when its volume accounted for 30 percent of all world trade.

In 1985, Zhu said, China cultivated counter-trade links with some 20 countries and business volume was estimated at between $700 and $800 million. This estimate excludes compensation trade deals, which were included in foreign investment figures.

Last year, China signed compensation deals worth $213 million, up 31.5 percent from 1984.

Sources said that counter trade not only allowed China to increase its foreign trade without using up hard currency but also brought more Chinese goods to the world's attention.

Zhu said that China was rapidly developing counter trade. "There will surely be more progress in this direction this year," she said.

Last year, China's counter trade mainly involved raw materials and consumer goods. This year, there is a change of focus. Emphasis is being put on the import of complete sets of equipment and technology, which will enable China to produce more goods for the world market, she said.

In 1985, China carried out barter trade with a number of countries including Indonesia, Brazil, Zimbabwe, Tunisia, Singapore, Algeria and Sweden.

China mainly bartered rice, cotton, tea, jute, [words indistinct], bicycles and farm machinery for timber, steel, cement, plywood, pig iron, chemical fibres, motor vehicles and sugar.

"This year, we have conducted trial barter imports of complete plants [word indistinct] power the export of our commodities," Zhu said.

So far, the country's Huaneng International Power Development Corporation in Beijing has signed barter contracts with General Electric Corporation of the United States, Mitsubishi Consortium of Japan and Alsthon Corporation of France to import their coal-fired plants in return for Chinese products.

The assistant minister said that barter and counter-purchase trade deals would be approved by her ministry and the Bank of China would act as guarantor.

The Ministry of Foreign Economic Relations and Trade opened an office last May within its Import and Export Bureau to coordinate and manage such trade.

With the development of the country's economy and the increase of its industrial and rural production, Zhu said, counter trade was expected to expand into other areas, such as labour service, technology and leasing.

GUANGDONG CONTINUES OPENING TO OUTSIDE WORLD

OW211036 Beijing XINHUA in English 1025 GMT 21 May 86

[Text] Guangzhou, May 21 (XINHUA)--Guangdong Province, whose export volume accounts for over 10 percent of China's total, has planned to export five billion U.S. dollars worth of goods by 1990.

This means a 73 percent increase over 1985 and an annual increase of 11.5 percent during the next five years, said Governor Ye Xuanping here today at the provincial people's congress.

By then, he said, finished products will account for 55 percent of Guangdong's exports, as compared to the present 40 percent.

Benefited from trade relations with 140 countries and regions in the world, the province exported 12.5 billion U.S. dollars worth of goods during the 1981-1985 period, a 67.1 percent increase over the previous five year.

Ye said that his province will also further develop its three special economic zones while building a number of enterprises with advanced technology in its two economic and technological zones in Guangzhou and Zhanjiang.

Guangdong's three special economic zones are Shenzhen, Zhuhai, and Shantou. China has altogether four such zones, with the fourth one--Xiamen City--in Fujian Province.

Other plans include "effectively introducing" foreign funds and technology, boosting tourism, and encouraging overseas Chinese and compatriots in Hong Kong and Macao to invest in their hometowns in the province.

The province introduced 2.4 billion U.S. dollars of foreign funds in the past five years, with an average annual increase of 47 percent.

The Sino-foreign joint ventures, cooperative enterprises and foreign-funded enterprises set up in the province now account for 60 percent of the total in China.

Guangdong received 1.85 million overseas tourists in 1985, as against 868,000 in 1980.

Governor Ye said the annual domestic gross product of the province will reach 92 billion yuan in 1990, a 56-percent increase over 1985.

He said the growth rate--9.3 percent annually--will be "a little higher" than the country's average but lower than the province's own growth rate during the 1981-1985 period.

Investment will be concentrated on energy, transport, telecommunications and raw material industry, he said.

FOREIGN TRADE AND INVESTMENT

BRIEFS

JAPANESE LOCOMOTIVES PURCHASE--China signed a contract yesterday evening to use Japanese loans for the purchase of 80 locomotives from Japan. The China National Technical Import Corporation (CNTIC) will use Japanese loans totalling about $100 million to buy the electric locomotives from Sumitomo Corporation. The contract was signed in the Great Hall of the People by Xu De'en, general manager of CNTIC and Tadashi Ito, general manager of Sumitomo Corporation. In the past, China bought electric locomotives mainly from France. Last year, 150 electric locomotives were imported from there, an official of the Ministry of Railways told CHINA DAILY. With the rapid expansion of railways, domestic production of electric locomotives has lagged behind the soaring demand. The imports of electric locomotives using low-interest and long-term foreign loans will ease the pressure on the already strained railways. TRADE TALKS WITH MALAYSIA--Hong Kong, May 8 (XINHUA)--Chen Muhua, state councillor and president of the People's Bank of China, arrived in Kuala Lumpur today for a four-day official visit to Malaysia, according to the Malaysian News Agency BERNAMA. Chen paid the visit at the invitation of Governor of Bank Negara (Central Bank) Jaffar Hussein. Chen Muhua is scheduled to call on Prime Minister Mahathir Mohamad, Finance Minister Daim Zainuddin and Trade and Industry Ministery Razaleigh Hamzah. She is expected to discuss with the Malaysian officials matters relating to the promotion of trade, banking and insurance cooperation and other areas of economic ties between the two countries. ISSUES IN ENTERPRISE WAGE SYSTEM REFORM DISCUSSED

Shijiazhuang HEBEI RIBAO in Chinese 2 Jan 86 p 4

/Article by Liu Jianxin /0491 1696 2450/: "Issues in Enterprise Wage System Reform"/

/Text/ The enterprise wage system reform is now getting underway throughout the province and is being closely observed by the broad mass of workers. It is of the utmost importance to unite everyone's thinking under party policies and principles and to further arouse enthusiasm on all fronts in order to successfully reform the enterprise wage system.

Linkage and Separation: The heart of this round of reforms of the enterprise wage system is the linkage of an enterprise's wages and bonuses with its economic returns and with the individual achievements of its workers. But these wages must be separated from wage reforms and wage adjustments for government organs and institutions. This is simply referred to as the "double linkage" and the "single separation." These solutions are the culmination of our experiences and have been arrived at through diligent consideration; they are important reforms that stand in contradistinction to the old, corrupt wage system. In the long run, all workers are to be considered direct socialist labor with wage adjustments under a nationally regulated and unified wage system; thus everyone will "advance hand in hand" and "be considered equal." But at present we are still unprepared in China to implement directly socialized labor or to equate all forms of labor. If this were so, the climate for managing an enterprise would be obliterated as would the relationship between economic returns and worker achievements, which would ultimately lead to a formal equality of workers as opposed to the inequality in reality. This most certainly is the main reason that enterprises "eat from the common pot" of the nation and workers "eat from the common pot" of the enterprise. Thus in order to destroy the two "common pots" it is necessary to abandon the long-used system in which income is distributed in one fashion.

A worker's remuneration must be closely tied to his individual work contribution and the enterprise's overall economic results; these wages must fluctuate with the level of economic returns achived by the enterprise. If an enterprise's economic returns are high and a worker's contribution signifciant, then his pay can be increased; in the opposie situation his pay must drop. This method focuses concern on the quality of an enterprise's management, on economic returns, and on the contribution of individual workers; the principle of each according to this work is to be grounded in reality. Moreover, enterprises, as economic entities, must have the right to manage their own wages. After implementing the second step of the tax reforms and linking total wages with the fluctuation of an enterprise's economic returns, relations between the government and enterprises should become better, the financial state of enterprises should improve and most enterprises should be able to become self-reliant. Enterprises must fully utilize wages as an economic lever, improve production and management, and do a good job of reforming the wage system. Thus it is essential that the government divest itself of the old wage-distribution system and instead focus its energy on production efforts and raising economic benefits. Only if production and economic returns increase will there be further improvement in the daily life of workers. Wage reform is a big step in the right direction.

Institutional Wage System and Graded Wage System: In this round of wage reforms, a structured wage system will be instituted whereby the wages of employees for government organs and institutions will be mainly determined by their professional duties; a graded wage system will be instituted for enterprise employees in which wages are tied to professional duties and technical level. Since a dual wage system is being implemented, it is necessary to consider the special characteristics and nature of work at government organs and institutions and enterprises as well as their traditional and present wage structure. Agencies and institutions are mainly service-oriented and are managed by the administrative government; their income distribution is a redistribution of national income. Enterprises are mainly concerned with material production and circulation; wage distribuiton is a form of direct distribution. A dual wage system is geared toward better implementing the principle of to each according to his work. The main component of the institutional wage system is professionally-based wages, which are determined by the actual administrative or technical responsibilities of a worker. Moreover, changes in responsiblities must be matched by wage changes. Thus a national worker's wages will be closely related to his job duties, responsibilities, and achievements. This should help raise the technical level of the worker and his efficiency and abolish pay imbalances that result in wages incommensurate with the profession.

Enterprises must institute a graded wage system with pay rooted in standardized technical levels, so that wages and technical skills are suitably matched; wage hikes must be based on assessment of technical levels. A wage system based on professional level must also be established for enterprise cadres with income directly related to professional duties. Merging a worker's pay with his technical level and amount of responsibility is a much better system. Moreover, if an enterprise can itself set concrete wage standards based on that enterprise's actual circumstances and if its economic returns are satisfactory, its funds abundant, and if it operates effectively in the long run, then it will be able to raise wages. However, if economic returns are poor and funds in short supply, resulting in a lowering of wage levels, this would be a further reflection of the principle "to each according to his work." Thus the broad mass of enterprise workers must accurately comprehend the Central Committee's policies and principles for wage reform and deeply appreciate the meaning behind the dual wage system. There cannot be indiscriminate imitation of the government organ and instituiton wage system, nor can there be competition with them.

The Purpose of Wage Reform and Increasing Wage Levels: At present, some people are raising a hullabaloo over wage reforms. They believe that wage reforms merely means wage hikes, a significant reform meaning a significant increase and a minor reform implying a minor wage increase. All they can see is more money. This kind of awareness is onesided. In truth, wage reform is being instituted with wage increases as the foundation, but the purpose of wage reform is to relinquish the former wage system which was detrimental to the development of production forces and establish a wage structure based on the principle of to each according to his work that can mobilize the enthusiasm of enterprises and workers. A new wage system that promotes the growth of production is not reform merely for the sake of individual wage increases. Thus, we must focus on rational wage relationships and establish a new wage system. We should realize that though China's economy has grown significantly in recent years, the forces of production are still at a relatively low level and the economy is still not very prosperous. With national finances and enterprises capabilities still limited, it is quite impossible for each worker to receive a large wage hike in one fell swoop. Moreover the growth rate of wages must remain below the growth rate in production and national income; the average growth in wages must also stay below the labor productivity growth rate. Overall labor costs in an enterprise's production scheme must continue declining. If reality is ignored and wages are blindly increased, consumer funds will grow wildly and that will surely result in serious aftereffects that will most certainly hinder national development and the steady improvement in the daily life of workers. It should also be realized that history has handed down to us many wage problems which are quite complicated. Many of these problems demand solutions from the point of view of an individual or a unit, but in considering the overall picture, these solutions would spark a chain reaction that would be difficult to deal with. Thus we must first take into account the interests of the whole.

LIAONING WORKERS LEARN ADVANCED FOREIGN TECHNOLOGY

OW201016 Beijing XINHUA in English 0950 GMT 20 May 86

[Text] Shenyang, May 20 (XINHUA)--Learning advanced foreign management and technology has become popular among workers, technicians and officials in Liaoning Province, the biggest heavy industrial center in China.

This change from an attitude of rejection of things from abroad is due to the policy opening to the rest of the world, local officials said.

Almost all major industrial enterprises in the province have imported technology and equipment from abroad over the past few years.

"We are backward economically and technically so we should learn the strong points of all nations to make up for our deficiencies," said Wang Dingsen, a 33-year-old worker in the Liaoyang Petroleum and Chemical Fibre Company.

When Wang entered the company eight years ago, the company imported technology and equipment from France, Italy and the United States.

"Operating this imported machinery," he said to himself, "it is not enough to depend on my junior middle schooling." He was determined to learn operation skills.

He went to the workers' training center of the company every evening. When a machine was installed, he always took notes on the foreign technicians' instructions on the principles, properties and operation skills.

With the help of his notes, Wang has not only become a skilled worker but also improved the operation process. As a result, the machine saves 100,000 kwh and 3,000 cubic meters of water a month against the designed indicators in the preparation of nitrogen.

Like Wang Dingsen, more than one-third of the 7.9 million workers in Liaoning are attending technical schools or training classes.

Most of the over 100,000 scientists and engineers in the province have finished advanced training courses, attended new technology lectures or followed TV courses as well as classes in foreign languages.

Liu Zongmeng, 48, an engineer of the Benxi Iron and Steel Company, has reviewed the Russian he studied earlier and learned Japanese and English in recent years.

As a result of reading the latest information about foreign furnaces, he understood that China's furnaces yielded 20 percent less than advanced models because of backward testing and measuring facilities.

He developed an automatic testing and measuring system for furnaces which received state appraisal last year. Use of the system in Benxi and Wuhan iron and steel companies has brought 1.7 million yuan in savings per furnace a year thanks to lower energy consumption and higher iron output.

Du Jingxin, director of the Dalian locomotive and rolling stock plant, said: "We are confident we can master the world's up-to-date technology and produce advanced locomotives."

He and engineers of the plant have visited Britain, Federal Germany, Switzerland and the United States in recent years.

Thanks to the imported technology from a British company, his plant has produced three new models of diesel locomotives. Compared with the old model, the latest type increases drawing power by nine percent, extends utilization life by 40 percent and reduces oil consumption by 40 percent.

The plant is now developing another model locomotive with cooperation from British experts.

Local officials said that almost all the enterprises' libraries have subscribed to foreign journals and collected foreign technical books. International standards have been adopted by a growing number of enterprises.

More than 50 countries have held exhibitions of technology and new products in Liaoning over the past few years.

SICHUAN'S LABOR SERVICES IN 1985 REVIEWED

Chengdu SICHUAN RIBAO in Chinese 12 Mar 86 p 2

[Article by Xie Jichong [6200 4949 0394]: Sichuan Placed 270,000 Workers in 1985"]

[Text] In 1985, 270,000 urban and rural workers were placed. The output value of the labor services companies' province-wide network exceeded 1.2 billion yuan and realized a profit of more than 50 million yuan.

In accordance with the relevant State Council and provincial government regulations, all levels of personnel departments throughout the province enhanced their thinking about and organization of labor service companies. In a spirit of correcting the incorrect, every level and type of labor service company was purified and rectified. Policy boundaries were clearly demarcated, the ideology guiding business was set right, promoting the healthy and stable development of labor service companies. In the past year more than 1,000 labor service companies sprung up, an increase of 29.6 percent over 1984, and more than 3,200 collective enterprises were set up, an increase of one-third over 1984. The development of production opened the way to placement of those awaiting employment. Last year, the number of workers placed in collectives by labor service companies increased by almost 60,000 people over the previous year. In the same year 21.5 percent of those awaiting employment were placed. Besides placing those who transferred the previous year, 20 percent of those who just reached working age in that year were placed. More than 60 percent of those placed went to the collective and individual economic sectors. More than 40 percent were placed after undergoing various types of professional and technical training.

BRIEFS

HAINAN-SINGAPORE AIR ROUTE--Hong Kong, April 23 (XINHUA)--An air service between Haikou, the capital city of Hainan Island in Guangdong Province, and Singapore will be officially inaugurated Saturday, it was announced here today. Under a contract signed with the Civil Aviation Administration of China [CAAC), a Hong Kong company will operate at least one return flight a month. The four-hour flight is expected to greatly facilitate the passage of travellers between the two places, which are directly linked only by sea at present; air passengers from Singapore at the moment have to change planes at Guangzhou, capital of Guangdong. HUAIHE HARNESSING--Beijing, 8 May (XINHUA)--China will invest 1.2 billion yuan on harnessing the Huaihe in the eastern part of China during 1986-1990 period, 6 times more than in the past 5 years. The river valley is populated by 130 million people, and produces 15 million tons of commodity grain a year--a quarter of the country's total. [Beijing XINHUA in English 1449 GMT 9 May 86 OW] /6662

INTERNATIONAL CONTAINER ROUTES--Beijing, 12 May (XINHUA)--The China Ocean Shipping Company has opened 17 international container shipping lines, reaching 33 ports in 19 countries and regions in Asia, Africa, Western Europe and North America. The company opened its first international line--to Australia--in 1978. Chinese ocean-going ships transported 320,000 standard containers or a total of 3 million tons of caro in 1985, according to company officials today. TONGJIANG OPENED TO FOREIGN SHIPS--Harbin, May 20 (XINHUA)--After receiving State Council approval, Tongjiang Port in northeast China's Heilongjiang Province today was officially opened to foreign ships, according to provincial officials here. The port is located near the China-USSR border at the confluence of the Songhua and the Heilong rivers. Heilongjiang is one of China's major producers of grain and timber. The province is the largest producer of soybean, beet, and flax in China and is also a base for industry, energy, and chemicals. In 1985, the province exported 410 million U.S. dollars worth of commodities and signed 43 contracts totalling 82 million U.S. dollars with foreign businesses. Its total volume of border trade with the Soviet Union last year was more than 30 million Swiss francs. [Text] [Beijing XINHUA in English 1115 GMT 20 May 86 OW] /6662

FINANCE MINISTRY SAYS TRADE SURPLUS CONTINUES TO INCREASE

OW200459 Taipei CNA in English 0331 GMT 20 May 86

[Text] Taipei, May 19 (CNA)--The Republic of China's trade surplus in 1986 had accumulated to U.S. dlrs 4.6 billion as of May 10 due to the booming exports of the past few months, an official with the Finance Ministry said Monday.

The official, who preferred anonymity, said according to customs statistics, the nation's imports from Jan 1 to May 10 increased by 4.22 percent from the same period of last year to U.S. dlrs 7.8 million while exports increased by 15.52 percent to U.S. dlrs 12.4 billion.

The exports in April registered the highest monthly growth in the past few years due to the fluctuations of foreign exchange rates and the fall of international oil prices, the official said. Among various export categories, metal products, transportation facilities, plastics products, textiles, wooden products and machinery even set the highest monthly record in terms of their value in April, he said.

Thanks to the booming exports, the nation's exports in April also showed an increase of 3.4 percent as compared with the same month of last year, he added.

Meantime, Economics Minister Lee Ta-hai said that the government is studying the possibility of allowing the people in this nation to buy stocks of renowned foreign companies through several monetary organizations designated by the government to alleviate the pressure incurred by the nation's excessive foreign exchange reserves which has hit U.S. dlrs 2.6 billion in May.

Lee, worried that the excessive foreign exchange reserves will constitute a great pressure to induce inflation in this nation, has ordered concerned agencies to study ways of encouraging the private sector and state-run enterprises to increase their investments in other countries.

COMMENTARY VIEWS RISING U.S. TRADE PROTECTIONISM

OW051125 Taipei Domestic Service in Mandarin 2300 GMT 2 May 86

[Station commentary: "Pay Attention to Protectionist Tide in U.S. Congress"]

[Text] In the past year or so, U.S. industrialists and businessmen have, through Congress, been pressuring the executive branch to formulate protectionist policies, thus worrying many of the countries trading with the United States. The Republic of China is one of them. Year after year our country has increased its exports to the United States, and so has our favorable balance of trade. As a result, our country has become one of the major targets the U.S. protectionist tide is pounding at.

Nearly 300 protectionist bills are under discussion in the U.S. Congress. Using its preferential tariff toward us as a bargaining chip, the United States has been asking our country to increasingly open up its market and reduce its tariffs, and has even announced that it will investigate the ratio between the foreign and domestic sales of automobiles made in our country [words indistinct].

A few days ago, the U.S. House of Representatives Appropriations Committee adopted a revised comprehensive trade bill. All those who voted for the bill were Democrats. Simply put, the revised bill requires the U.S. International Trade Commission to negotiate with countries having a favorable balance of trade with the United States 4 months after unfair conduct is discovered on the part of such countries. The bill also requires that in the 4 years beginning 1987, the favorable balance of these countries of as 1985 will be reduced by 10 percent a year. If no agreement can be reached through negotiations, the U.S. President will have to (?suspend the trade agreements with those countries).

This would be an extreme kind of action by a government. Considering the criteria set in the bill and actual conditions in 1985, they would be applicable only to Japan, the Republic of China, and West Germany.

U.S. President Reagan is currently attending a meeting with ASEAN foreign ministers in Bali, Indonesia. His initial reaction to this bill is that he would spare no efforts to resist protectionist measures restricting world trade. He stated that it would indeed be a disaster if international trade was reduced by a big margin. U.S. public opinion predicts that even if the House of Representatives adopted the bill, Reagan would certainly veto it.

We have the following views regarding the rising trend of protectionism in the United States: First, our country has a favorable balance of trade with the United States after opening up our market to imports, reducing tariffs, and making many other similar efforts. We have done and are doing what we should do in this regard. U.S. cigarettes and alcoholic beverage will (?being to be exported) to Taiwan in August this year, and the fourth round of Sino-U.S. tariff talks is scheduled for July. These are cases in point. Meanwhile, most of our exports to the United States are articles for daily use; they are low-priced but of good quality. They are very conductive to reducing the American consumers' burdens. It is necessary to give wide publicity to such facts so as to make them known to large numbers of American people. At the same time, we should make them understand that we are opposed to any (?protectionist measures) in trade.

Second, it is necessary to make positive representations with the United States in this regard. It should be pointed out that the revised bill runs counter to the spirit of free and fair trade embodied in the U.S. Import Act of 1986 [words indistinct]. It is hoped that the U.S. Congress will not adopt the revised bill and that the U.S. Government will not implement it, because the bill will harm other countries and will not benefit the United States.

Third, by means of our trade relations with West Germany and Japan, we should express the hope to them that at the forthcoming summit conference in Tokyo they would raise the question of opposition to protectionism for discussion in order to expand free international trade and make U.S. trade policy stay on the right track.

TAIWAN

APRIL EXPORTS REACH SINGLE-MONTH RECORD

OW080349 Taipei CNA in English 0320 GMT 8 May 86

[Text] Taipei, May 7 (CNA)--The exports of the Republic of China in April reached a new single-month high of U.S. $3.15 billion worth. The figure represents an increase of 17.3 percent as compared with the same month of last year.

According to statistics released by the Directorate General of Budget, Accounting and Statistics, the two-way trade of the nation in the first 4 months totaled U.S. $18.79 billion worth, up 13.2 percent over the like period of 1985.

While exports of the January-April period amounted to U.S. $11.52 billion, up 18 percent, the imports in the period summed up to U.S. $7.27 billion, up 6.4 percent. The trade surplus, therefore, accumulated to U.S. $4.25 billion, the statistics show.

In the single month of April, the nation's exports amounted to U.S. $3.15 billion while the imports totaled U.S. $1.94 billion, up 17.3 and 3.4 percent respectively over the same month of last year.

The United States continued to be the nation's largest market in the first 4 months, having absorbed 47.8 percent of the ROC's total exports with U.S. $5.5 billion worth, followed by Japan, U.S. $1.3 billion or 11.3 percent, and Hong Kong, U.S. $790 million or 6.9 percent.

As to imports, Japan kept its role as the nation's main supplier with U.S. $2.21 billion worth of transactions with the ROC, or 30.4 percent of the ROC's total imports in the period. The United States followed with U.S. $1.64 billion, or 22.6 percent; Saudi Arabia stood third with U.S. $390 billion, or 5.4 percent.

Industrial products occupied 93.9 percent of the nation's total exports with U.S. $10.82 billion worth. Processed farming products totaled U.S. $530 million, or 4.7 percent and crude farming products, U.S. $160 million or 1.4 percent.

Capital goods totaling U.S. $1.8 billion worth, taking a 24.7 percent share in the nation's imports. Raw materials for agricultural and industrial use occupied 66.4 percent, or U.S. $4.82 billion consumer goods occupied 6.9 percent, or U.S. $640 million.

Meantime, the statistics show that the nation's efforts in diversifying its overseas markets have achieved notable results. The exports in the first 4 months to Europe totaled U.S. $1.29 billion, a sharp increase of 31 percent over the same period last year. The exports to Central America reached U.S. $1.8 billion worth and to South America U.S. $620 million, up 45 percent and 41.1 percent respectively.

West Germany is the largest market of the ROC in Europe. The ROC exported U.S. $349 million worth of goods to that nation in the January-April period, up 34 percent as compared with the same period in 1985. England followed with U.S. $230 million, up 19.3 percent. The Netherlands was the ROC's third trade partner in Europe in terms of exports with U.S. $180 million worth, a 19.5 percent rise over a year before.

ECONOMIC TALKS WITH SAUDI ARABIA CONCLUDED

OW051151 Taipei CHINA POST in English 3 May 86 p 12

[Text] The Republic of China [ROC] will expand agricultural, industrial, medical and other assistance to Saudi Arabia as part of closer cooperative relations following the conclusion of the 2-day 9th session of the Sino-Saudi Arabia Permanent Joint Committee on Economic and Technical Cooperation in Taipei.

At the closing meeting yesterday, Minister of Economic Affairs Lee Ta-hai and his Saudi counterpart Minister Muhammad Aba al-Khayl, signed the minutes of the meeting. Both in their speeches, expressed satisfaction with the success of the meeting and the agreements reached.

Yesterday's meeting concerned reports on financial and technical cooperation, science and technology, trade, industry and electricity. The conclusions will be submitted to the authorities for implementation.

The main points of the minutes are:

Agriculture: The ROC will assist the Saudis to develop the southeastern mountains of the kingdom and dispatch specialists to develop orange groves and marine and fishery programs.

Printing Technology: Saudi Arabia will select 16 technicains for training here.

Communications: The ROC will add to computer and communications personnel already in Saudi Arabia but asked that their salaries be raised. The Saudi hope that the ROC will help them build surveillance and control systems on freeways.

Medical Programs: Saudi Arabia asked for Chinese specialists in bio-medical science and medical information managers as well as other related personnel. The two delegations signed a memorandum of understanding on medical cooperation.

Science and Technology: The two nations will jointly develop software for Arabic language computers and the development of solar energy and expand marine product research along with the existing program on freshwater fish.

Financial Cooperation: Saudi Arabia agreed to revise, if necessary, the loan agreement on the Taipei underground project.

Industry: Saudi Arabia agreed to provide needed liquified ammonia and petrochemicals.

Trade: The two nations will increase exchange visits and exhibitions, step up trade cooperation and measures to prevent counterfeiting and commercial disputes.

The next meeting of the Joint Committee will be held in Saudi Arabia but the date will be decided later.

The Saudi delegates left Taipei yesterday.

GOVERNMENT TAKES STEPS TO REDUCE FOREIGN RESERVES

OW091201 Taipei CNA in English 1006 GMT 9 May 86

[Text] Taipei, May 9 (CNA)--The Republic of China's foreign exchange reserves have been soaring at a monthly rate of U.S. $1 billion since the beginning of this year. As a result, assets held by the Central Bank of China snowballed from U.S. $23 billion last December to U.S. $26 billion by the end of March.

According to the International Monetary Fund, the ideal amount of a nation's foreign exchange reserves is the equivalent of 3 months of its imports. By this standard, the ROC has far more reserves of foreign exchange than it is able to digest. The ideal amount would be U.S. $6 billion.

With the nation's export trade on a strong upswing, the for-ex reserves are expected to continue rising at a brisk pace for the remainder of the year. Monetary officials figures that by the end of this year, the ROC may overtake Japan in the amount of its foreign reserve holdings. Japan currently has U.S. $30 billion. Before the year runs out, the ROC may have as much as U.S. $35 billion.

A big foreign exchange surplus is not necessarily a boon, says Miss Ching Hsiu-lien, a specialist with the Council for Economic Planning and Development. For one thing, she says, it may push commodity prices up because of the bloated money supply.

Domestic money supply has been on the rise steadily in the past 3 months, an increase of 14 percent in January, 17.3 percent in February, and 21.2 percent in March.

Chang said in an interview that an excessive money supply is one of the causes that prompt prices to go up, but not the only one. There are still other factors at work. It is usually the interaction of these factors that trigger an inflationary spiral. The effect of an excessive money supply will be felt after a 6-month to 1-year lag.

Chang attributes the large accumulation of for-ex reserves partly to the long-time government control over foreign exchange operations. Another major reason is the nation's ever-widening trade surplus. The nation's exports have grown faster than imports in the past years. In 1985, exports rose by 1.7 percent to

U.S. $31 billion while imports dropped by 9.1 percent to U.S. $20 billion. The resulting trade surplus was U.S. $11 billion, representing a 29.5 percent increase over the 1984 level. In the first quarter of this year, exports zoomed by a hefty 18.3 percent to U.S. $8.38 billion whereas imports picked up 7.5 percent to U.S. $5.33 billion, leaving a favorable balance of U.S. $3.05 billion.

Chang points out that the best way to whittle down the overabundant foreign exchange assets is to encourage more imports and more investment abroad.

Recognizing the potential adverse effect of the huge foreign exchange accumulation, the government has taken vigorous steps to shed off the excessive fat and ease the pressure on the money supply and movement toward inflation. First of all, the government has recently opened the doors to large-scale investment in foreign capital markets. Local financial institutions, corporations and individuals are now allowed to buy foreign government securities or foreign-bank time deposits through the Central Trust of China, Bank of Taiwan and International Commercial Bank of China. To further facilitate such outward investments, the government plans to designate several other banks to join in the operation in the near future.

Moreover, the government has revised the Foreign Exchange Control Act to allow a freer operation of foreign exchange assets. In the past, the base criterion used for determining each company's for-ex settlements was its export/import permits. But under the new rules, such settlements will be determined according to each firm's reported trade records. The revision was already approved by the legislative yuan last week.

The government also has raised the foreign exchange allowance for outgoing travellers several times in the past over year. Outbound tourists now can take more money along. Those who will leave as tourists may apply for a daily foreign exchange allowance in the amount of U.S. $200 for upward to 3 months, depending on the actual duration of travel. The daily for-ex allowance for those who leave for a foreign country on business, for employment, study, or for visiting relatives is raised to U.S. $300, in addition to a "pocket money" allowance in the amount of U.S. $3,000.

As for the encouragement of imports, the government has taken a number of strong steps in the past few years. Many items are now duty free and the highest tariff rates for those dutiable articles have been cut to 67.5 percent. Moreover, the government cut back interest rates four times last year to encourage private firms to borrow more from the banks to finance their expansion or renovation plans. As a result, bank interest rates in the country dropped to a record low since the end of World War II.

In a recent report to the Finance Committee under the Legislative Yuan, Governor Chang Chi-cheng of the Central Bank of China said his bank is willing to work out a comprehensive plan with other government agencies on how to make good use of the nation's rich for-ex reserves. Chang pledged that CBC is making the funds available to the business and industrial sectors to help pay off imports and for foreign exchange loans. He revealed that Taiwan Power Co is preparing to repay its loans to foreign banking institutions through lending from the Central Bank to save expenses in interests.

Chang continued that the Central Bank will use as much of the for-ex reserves as possible on construction projects that will benefit the public. "New investment projects, as long as they have been approved by the government, will have full financial support from the Central Bank," he said.

BANK GOVERNOR COMMENTS ON FOREIGN INVESTMENT PLANS

OW140343 Taipei CNA in English 0319 GMT 14 May 86

[Text] Taipei, May 14 (CNA)--The government is scheduled to allow high-tech firms invested in by foreigners and overseas Chinese to deduct several remittances directly from their for-ex accounts this coming August, according to Chang Chi-cheng, governor of the Central Bank of China (CBC).

The reform is aimed at stimulating investments by foreign nationals and overseas Chinese, especially in the high-tech industry because it is considered vital to the nation's future economic development.

Remittances which will be deductable from for-ex accounts are listed as follows:

--Approved expenditures on imported commodities;

--expenditures for studying abroad, travelling, visiting, or mediation abroad;

--remittances of paid-in capital for investment here and the capital earnings entailed;

--approved foreign loans and investments;

--approved capital and interest remittances for foreign loans;

--and royalties from technical cooperation projects.

COMMENTARY WELCOMES DIRECT FOREIGN INVESTMENT

OW210611 Taipei International Service in English 0200 GMT 21 May 86

[Station commentary]

[Text] Two recent developments with respect to foreign direct investment in Free China are worth noting. First, the Legislative Yuan has revised a statute relaxing restrictions on foreign investments in Taiwan of the Republic of China [ROC]. The fields in which foreigners are allowed to invest or commence business operations have been broadened to include more service industries and provision has been made for the entire amount of business profits made by the foreign enterprises, after one year of operations, to be remitted back to their home countries.

Second, it is reported that the Ministry of Economic Affairs is considering changing the ground rules with respect to the areas of investment open to foreigners. Up to now, foreigners have been allowed to invest only in certain specified industries; they cannot apply for permission to invest in industries which are not on the list. Now, the Ministry of Economic Affairs is considering reversing the rule so that the fields in which foreigners are not allowed to make investments will be specified and listed, implying that more industries will be opened up to foreign investment.

It is still too early to tell what all this means in practical terms. It is fair to say, though, that the Government of the Republic of China does want to liberalize the restrictions now imposed on foreign direct investment.

According to the press, this move of the ROC Government has been met with support from the public. In their view, foreign direct investments have been a positive force in Taiwan's economic success and will continue to have an important contribution to make in upgrading Free China's economy in the future.

To be sure, foreign direct investment has never constituted a large proportion of total domestic private capital formation in Taiwan, averaging only a little over 5 percent in the 1960's and less than 3 percent in the 1970's. But these averages hide the fact that foreign-owned enterprises have played a dominant or significant role in terms of their share of total employment or production in certain industries such as electronics and electrical appliances, chemicals, and garments and footwear.

What is more important is that foreign enterprises by and large have applied foreign technology in their production, and the Chinese-owned enterprises have learned such foreign technology from them. In other words, foreign enterprises have been effective agents for the transfer of technology. In the process of econmic upgrading, there is nothing more important than the continuous introduction and application of new technology.

Furthermore, foreign businessmen might have a perspective on behavior that is different from that of the Chinese businessmen, and thus foreign investment may serve as a stabilizing or diversifying force in Taiwan's economy. In the last couple of years, domestic investment was law, but the total amount of foreign direct investment approved by the Ministry of Economic Affairs increased. Their optimism on Taiwan's economy must have had a positive effect on Taiwan's economy. From all we can tell, there will be more and more foreign firms, especially from Japan and Europe, which will explore the possibilities of establishing branches in Taiwan, and they will be surely met with warm welcome.

TOYOTA AFFILIATE TO PRODUCE CAR ELECTRIC PARTS

OW221041 Taipei CNA in English 1022 GMT 22 May 86

[Text] Tokyo, May 22 (CNA)--Nihon Denso K.D., a member of Japan's giant Toyota conglomerate, will set up a joint venture company with two Chinese manufacturers for production of car electric accessories in the Republic of China, an automobile industry source here said Thursday.

The Chinese companies are Taichuan Electric Engineering and Notai Motors.

Negotiations have been under way between Nihon Denso and the Chinese companies since early this year, the source said. A top Nihon Denso executive will visit Taiwan before the end of this month to conclude the negotiations on the joint venture, the source said.

When contacted by CNA, a Nihon Denso spokesman said an agreement on the joint venture will be reached after the negotiations are concluded.

In the final negotiations, Nihon Denso and its two Chinese partners will decide on the electric accessories to be produced, scope of production, plant site, capitalization, equaity shares and management and administration.

If everything goes well, Nihon Denso and its Chinese partners are expected to file an application with the Ministry of Economic Affairs in July for the establishment of the joint venture company, the source said. Production will start in 1988.

What has prompted Nihon Denso to start the joint venture is Toyota's equity participation in Kuo Jui. Nihon Denso provides Kuo Jui with car electric accessories.

Another factor leading to the Nihon Denso decision is the strong yen, which makes production in Japan too costly.

BRIEFS

MARKETS DIVERSIFIED, EXPORTS BOOSTED--Taipei, May 21 (CNA)--The Republic of China's [ROC's] efforts to diversify its export markets has resulted in sharp increases of exports to Europe, Japan, Central America, and South America, Vincent Siew, director general of the Board of Foreign Trade [BOFT], said Wednesday. Speaking before the Economic Committee of the Legislative Yuan, Siew said that in the first four months of this year the ROC's export trade to Europe and Japan increased 31 percent and 18.5 percent respectively. The respective increases of exports to Central America and South America during the same period reached 45 percent and 41.1 percent. The ROC's exports to the Middle East rose 10.5 percent during the four-month period in spite of the fact that the economies in most countries in that region were suffering from declining oil prices, Siew said. He said the BOFT is trying to help domestic traders diversify their export markets due to the growing trade protectionism sentiment in the United States. The BOFT has taken steps to encourage domestic manufacturers and exporters to participate in trade fairs in Europe and help European importers to set up offices in Taipei, Siew said. An ROC trade mission is scheduled to visit Europe next month, he added. [Text] [Taipei CNA in English 0249 GMT 22 May 86 OW] /6662

INCREASED TRADE WITH EUROPE--Taipei, May 21 (CNA)--Sino-European bilateral trade amounted to U.S. dollar 2.22 billion from January to April this year, representing a growth of 24.5 percent over the same period a year ago. This marks the highest growth rate in six years, reported V. C. Siew, director general of the Board of Foreign Trade (BOFT). Siew attributed the growth to the appreciation of European currencies against the U.S. dollar, to which the Taiwan dollar is pegged. Thus, locally-made items became more competitive in the European market. He added that, with the exception of Greece, where there was no increased demand for Taiwan-made products, exports to the 17 nations in free Europe registered a marked increase. He pointed out that the appreciating yen also benefited Taiwan exports to Japan, and encouraged local manufacturers to take advantage of this opportunity to enter Japanese markets. [Text] [Taipei CNA in English 0326 GMT 21 May 86 OW] /6662

JAPANESE INVESTMENTS--Taipei, May 13 (CNA)--Japanese investments in the ROC [Republic of China] in the first quarter of this year totaled nt dollars 1.9 billion (U.S. $48.7 million), accounting for more than 50 percent of total foreign investments, officials of the Ministry of Economic Affairs reported Monday. The Japanese investments represented an increase of 241 percent compared with the amount registered in the same period last year. The officials described the increase in Japanese capital inflow as "very impressive." According to the ministry officials, the sharp evaluation of the Japanese yen has been unfavorable to Japanese exports, and, therefore, many Japanese investors have turned to the Republic of China for investment or venture projects. The nation's competitive foreign exchange rates, low labor costs, and skilled work force also contributed to the attraction of Japanese investments, the official explained. He said that besides the Toyota Motor Corp and Mitsubishi Industries, many Japanese firms in the ROC have applied for reinvestment projects, mostly in the chemical and electronic industries. ECONOMY AFFECTED BY PRC FOREIGN EXCHANGE CONTROLS

HK241013 Hong Kong HONG KONG STANDARD in English 24 Apr 86 p 8

[Text] China's tightening foreign exchange controls and its cautious import-export plans this year are beginning to affect Hong Kong's economic performance, as shown in the provisional trade figures for March released by the government yesterday.

The Census and Statistics Department's comparative figures for Hong Kong's re-exports in the period from January to March this year showed a $1.47 billion or 5.8 percent decrease from re-exports in the same period of 1985.

Re-exports amounted to $24 billion this year against $25.47 billion last year in the same three-month period.

A government secretariat spokesman admitted that the decline in Honk Kong's re-exports probably reflected the effect of China's tightening control over its foreign exchange spending.

China's foreign exchange reserves stood at US$11.9 billion at the end of 1985, down from the 1985 third quarter reserve of $12.6 billion, and from $16.3 billion in September 1984, according to earlier XINHUA Agency reports.

Stringent measures taken by the Chinese Government have halted the falling trend of its foreign exchange reserves but Hong Kong, which made huge gains during China's import spending spree in 1984, could not escape from the adverse consequences.

Hong Kong's domestic exports, valued at $29,146 million in the first three months of 1986, on the other hand, showed a slight increase of $170 million (0.06 percent) over the same period last year.

The comparative figures for total exports in the same period were about $53.15 billion in 1986 and $54.45 billion in 1985, representing a drop of 2.4 percent this year.

While the visible trade balance showed a $449 million surplus in Hong Kong's favor in Jan-Mar 1985, there was a deficit of $2,521 million this year, because imports showed a growth of 3.1 percent this year over last year ($55.67 billion and $54 billion respectively).

For March 1986 alone, domestic exports figure was $10,269 million which was $1,839 million (22 percent) higher than in the same month last year.

March re-exports for 1986 at $8,566 million were $512 million (6 percent) lower than 1985.

Taking domestic exports and re-exports together, the value of total March exports at $18,835 million was 8 percent or $1,327 million [higher] than those of March 1985.

The value of March imports also fell marginally, by 0.2 percent or $32 million to $19,883 million. This narrowed Hong Kong's visible trade gap for March (that is, the part of the value of imports not covered by the value of total exports) down to 5.3 percent from 12.1 percent of March last year.

Putting the month's trade figures into context, the secretariat spokesman pointed out that the value of total exports for the 12 months ended March 1986 was $233,854 million, made up of domestic exports of $130,052 million and re-exports of $103,802 million.

Compared with the same period in 1985, he said the 1985 values of total exports and re-exports grew by 2 percent and 14 percent respectively, while the value of domestic exports fell by 6 percent.

Comparative figures of the first quarter performance of Hong Kong's re-exports in the two years showed a definite downward trend, not likely to be reversed unless China relaxes its foreign exchange controls again. However, Hong Kong's domestic exports fared a little better.

The secretariat spokesman said that the year-on-year increase in the value of domestic exports in the first quarter of 1986 meant a reversal of the declining trend seen in the last three quarters of 1985.

Sources in the manufacturing sector, however, would not predict any real upward trend for Hong Kong's domestic exports in view of the uncertainty over the impact of protectionism on Hong Kong's major export markets in the months ahead, amid keen competition in the Asia-Pacific region.

POLITICAL SIGNIFICANCE OF GATT MOVE 'ENORMOUS'

HK250557 Hong Kong SOUTH CHINA POST in English 25 Apr 86 p 1

[Text] Hong Kong took another step from under Britain's umbrella yesterday when it became a contracting party to the General Agreement on Tariffs and Trade and the Multi-Fibre Arrangement [MFA].

Although the political significance of the move is enormous, practically, it means little to the way Hong Kong handles its commercial affairs.

Until yesterday, Hong Kong was part of GATT through its colonial ties to Britain.

Hong Kong's graduation had been expected for more than a month and follows declarations made by Britain and China to GATT Director-General Mr Arthur Dunkel in Geneva.

Other GATT members had also been quietly canvassed by Britain to make sure there would be no objections.

Under the joint declaration on Hong Kong's future, both Britain and China had agreed to work towards ensuring the Special Administrative Region's [SAR] participation in GATT and the Multi-Fibre Arrangement.

The British declaration said: "Hong Kong possesses full autonomy in the conduct of its external commercial relations and of the other matters provided for in the agreement."

The Chinese declaration made it clear that after July 1, 1997, the Hong Kong SAR will commune to be a contracting party to the agreement.

China itself is not a GATT member, having withdrawn after the communists gained power in Beijing.

It has, however, said it wants to rejoin.

Developing a framework for Hong Kong's independence from Britain under GATT was one of the major accomplishments of the third meeting of the Joint Liaison Group.

After July 1, 1977, the Chinese declaration said the Hong Kong SAR "will decide its economic trade policies on its own and may on its own, using the name 'Hong Kong, China,' maintain and develop relations and conclude and implement agreements with states, regions and relevant international organisations in economic, trade and other fields."

Following the announcement, the secretary for Trade and Industry, Mr Eric Ho, said Hong Kong has for years "been playing an autonomous role in GATT and the MFA" from within the British delegation.

"There will be little variation of substance in future," Mr Ho said.

It also means Hong Kong will now have to start paying its own way.

Hong Kong's share of the annual GATT budget, which had been borne by Britain, is likely to hit 900,000 Swiss francs (about HK$3.81 million) a year.

DOLLAR FOREIGN CURRENCY DEPOSITS DECLINE IN MARCH

HK060729 Hong Kong SOUTH CHINA MORNING POST in English 6 May 86 BUSINESS NEWS p 1

[By BUSINESS NEWS Editor Jerry Norton]

[Text] Both Hong Kong dollar and foreign currency deposits declined in March, but the drop was more pronounced for the local unit.

Total money supply also fell, according to monetary statistics released yesterday by the government.

Loans and advances for visible trade finance were up, but other loans for use in Hong Kong were flat.

The figures showed the trend continuing in which foreign currency accounts represent an increasing proportion of total deposits in the territory, although the degree of change was much smaller in March than in February.

All Hong Kong dollar deposits fell by one percent in March from February, to $216.3 billion.

Seasonal factors influenced the change, the government release said.

All foreign currency deposits slipped by 0.1 of a percent, to $255.4 billion.

The changes put foreign currency at 54.1 percent of total deposits in March and local dollar accounts at 45.9 percent, against 53.9 percent and 46.1 percent, respectively, in February.

Total deposits, including both foreign and local currency, were off 0.6 percent to $471.7 billion.

Since March last year, when Hong Kong dollar deposits accounted for a majority of the total, they have increased by only 9.2 percent, compared with a 36.4 percent rise for foreign currency deposits.

The continued shift from the local unit to foreign currency has raised concern over whether there is a growing lack of faith in the Hong Kong dollar, and about its long-term future if the trend is not checked.

The weakening of the Hong Kong dollar relative to currencies other than the greenback has been blamed as one factor in the switching, as have less attractive interest rates for Hong Kong savings than those in other currencies.

Little can be done about the former factor as long as the link with the U.S. currency remains and the greenback stays soft.

Lower local interest rates have contributed to calls for an end to having rates set by the Hong Kong Association of Banks rather than left to market forces.

Lack of confidence in the political situation has also been cited as contributing to the trend.

Some observers, however, suggest the concern over the growth in foreign currency deposits is overdone.

Hong Kong and Shanghai Bank economists, for example, took the contention to task in their April Economic Report, arguing that the increase should be a "welcome development," showing Hong Kong's success as a financial center.

They suggested deposits in other centers are even more heavily weighted towards foreign currencies.

Regarding total money supply, the government statistics released yesterday showed it decreased in March compared with February by every definition.

The most narrow measure, M1, was down 2.7 percent, M2 was off 0.1 of a percent, and M3 slipped 0.5 of a percent.

M1 had also decreased in February, but the other two measures had shown gains.

Seasonal factors were again cited in the government's statement, including, in the case of M1, an decrease in legal tender notes and coins held by the public.

Total loans and advances extended by banks and deposit-taking companies registered a 1.5 percent increase in March from February, similar to gains in the previous two months.

The latest rise took the overall figure to $459.2 billion.

Loans denominated in Hong Kong dollars were up 0.7 of a percent, but those in foreign currencies rose 2.3 percent.

Loans to finance Hong Kong's visible trade showed a 2.4 percent rise to $31.9 billion.

Yesterday's report also included a quarterly analysis of loans and advances.

It showed healthy gains in the first quarter of this year in loans and advances to the manufacturing sector, up 7.4 percent from the previous quarter and 9.2 percent from the same quarter last year.

Compared with the same respective periods, the building, construction and properly development sector figures were down 5.3 percent and 18.8 percent.

EVERBRIGHT DISCUSSES OBTAINING SHARE OF HONG KONG BANK

HK070231 Hong Kong HONG KONG STANDARD in English 7 May 86 BUSINESS STANDARD p 1

[By Eva To]

[Text] China Everbright Holdings Company, a mainland enterprise directly controlled by China's State Council, is seeking a 50 percent stake,worth about $114 million, in a small local bank.

The all-too-willing target is Hong Nin Bank, a family enterprise which has been looking around for a big brother.

The acquisition is being engineered through China Nanhai Oil Shenzhen Service Corporation (CNOSSC), 33.3 percent of which is held by Everbright.

The honorary chairman of CNOSSC is Everbright's chairman, Wang Guang-ying.

The two have already had a round of discussions.

Everbright's move underscores the desire of various China concerns to establish a foothold in Hong Kong's financial scene, now that China International Trust and Investment Corporation (CITIC) has shown the way by taking over Ka Wah Bank.

CITIC is also controlled by the State Council.

Informed sources said that though the discussions were initiated by Hong Nin Bank, CNOSSC is keen to establish a toehold in the local financial market.

A senior official of CNOSSC, who is directly involved in the discussion, told BUSINESS STANDARD yesterday from Shenzhen that the first round of talks was held in Hong Kong recently and that the second round will follow soon.

He said that although the size of the stake in Hong Nin has not been decided, CNOSSC would prefer 50 percent.

In 1984, shareholders fund in Hong Nin Bank stood at $227.9 million -- which means CNOSSC may have to spend $114 million in foreign exchange for the deal.

"As CNOSSC is still waiting for Hong Nin's 1985 results, which are expected to be out within two months, a decision before then is highly unlikely.

"And when the CNOSSC makes up its mind, it still has to get the approval of related financial authorities which include the country's central bank, People's Bank of China and the State Administration for Foreign Exchange Control," he said.

Set up in August 1984, the CNOSSC is a joint venture of three Chinese enterprises -- the China Everbright Holdings Company, the Shenzhen Special Economic Zone Development Corporation (SSEZDC) and the China Nanhai Oil Joint Service Corporation -- with each holding a one-third stake.

The SSEZDC is under the direct control of the Shenzhen municipal government. CNOSSC chairman, Luo Changren, is also an official of the municipal government.

An Everbright spokesman also confirmed that negotiations had taken place but stressed that Everbright was not directly involved.

He also said that the matter had not yet been raised with the CNOSSC board. He said Everbright has no direct presence in the financial field and any move in that direction will have to be approved by the country's State Council.

The Lee family, which controls the Hong Nin Bank, incorporated the bank in May 1922 as the Hong Nin Savings Bank. The paid up capital was negligible and was increased from $35 million in 1980 to $60 million in 1981, then again to the existing level of $100 million in 1982.

Current liabilities, which include customers' deposits and other items including provision for taxation, rose from 1980's $106.2 million (excluding provision for taxation) to $135.2 million in 1981, $363.5 million in 1982, and $605 million in 1983 and 1984.

But the bank's general reserve has continued to slide during this period, from $37 million in 1980. The reserves fell to $30 million in 1981, and to $10 million in 1982. It stood at $20 million in 1983 and 1984.

Post-tax profits have not been too attractive either. They plunged from $26.2 million in 1983 to $13.7 million in 1984. Profits in earlier years were $23 million ('80) $25 million ('81) and $21 million ('82).

Besides its headquarters in Central, the Hong Nin Bank only has four other outlets in the territory. Subsidiary companies include Hong Nin (Nominee), Hong Nin Finance and the Jersey Incorporated Hong Nin (Overseas).

Hong Nin (Overseas) has been incorporated for years but has not engaged in any trading.

The six-member board, headed by Lee Ping-chiu, is drawn exclusively from the Lee family.

HONG KONG

PBOC: NO PROPOSALS RECEIVED ON HONG NIN BANK ACQUISITION

HK090427 Hong Kong SOUTH CHINA MORNING POST in English 9 May 86 BUSINESS NEWS p 1

[By Olivia Sin]

[Text] A senior official of Shenzhen branch of the People's Bank of China [PBOC] said yesterday the bank had not received any proposal from the two Shenzhen agencies said to be interested in acquiring Hong Nin Bank in Hong Kong.

Any Chinese state-owned corporation planning to buy a stake in a bank would first have to seek approval from PBOC, the country's central bank, he said.

The two agencies which have been mentioned in connection with Hong Nin are Nanhai Oil Shenzhen Development and Service Corp and Shenzhen Special Economic Zone [SEZ] Development Corp.

The PBOC official, who declined to be named, said he understood that the two corporations were studying the possibility of "investing" in Hong Nin Bank, but that no decision had yet been made.

he said the PBOC would arrange meetings with the two agencies to find our more about their plans.

Other sources said Nanhai Oil Shenzhen, which does not have a license to conduct currency and banking activities, wants to acquire Hong Nin through a finance company owned by the Shenzhen SEZ Development Corp.

The finance company, which is similar to a Hong Kong deposit-taking company, is restrict to operating in the special economic zone.

However, officials of the finance company yesterday denied any knowledge of a deal and said they had not contacted any Hong Nin executives.

The People's Bank official said the formal procedure for Chinese entities wishing to acquire a bank was to submit detailed financial feasibility studies to the PBOC for examination.

"We will then check the financial situation and the management structure of the target bank: he said, adding that the buyers' credentials and financial background would also come under scrutiny.

"We will not approve unless they meet our stringent requirements."

Some critics have challenged the financial strength and the management level of Nanhai Oil Shenzhen Co, which was set up in 1984 to develop a 38 sq km area in Nantou -- west of Shenshen -- into a logistics base for the South China Sea oil exploration program.

They said the company could not be compared with China International Trust and Investment Corp (CITIC), which has brought Ka Wah Bank. CITIC was managed by highly competent and well-qualified staff with direct support from the State Council, they said.

Nanhai Oil Shenzhen is owned equally by the China Everbright Holding Co, China Nanhai Oil Joint Services Corp and Shenzhen SEZ Development Co.

Sources said Nanhai Oil Shenzhen Co may have encountered difficulties in raising funds because of lackluster drilling results and housing and office surpluses, and may see a stake in Hong Nin Bank as making it easier to obtain funds in the future.

AILING HONG KONG SHIPPING GROUP MEETS CREDITORS

OW161825 Beijing XINHUA in English 1744 GMT 16 May 86

[Text] Hong Kong, May 16 (XINHUA)--The Hong Kong-based Tung Shipping Group, one of the world's biggest shipping companies, today proposed to its creditors a coordinated restructuring plan to deal with its severe financial problem.

More than 250 people representing some 150 creditors from Hong Kong, Japan, the United States and Europe attended the briefing session.

The proposal suggested that the group, which at present consists of the publicly listed company Orient Overseas (Holdings) Ltd. (OOHL) and the Tung Private Group (TPG), be reorganized into two major entities, both focused on shipping.

One would be a New Container Group (NCG), which would be majority-owned by OOHL. The second would be the Tung Tankers and Bulkers Group (TTB), which would hold most of the tankers and bulk carriers in the group.

A new entity, the Tung Holdings Trust (THT), would own the common shares of TTB and up to 90 percent of the ordinary shares of OOHL.

Four consecutive years of depression in the world shipping industry coupled with an over-borrowed balance sheet has put the Tung Group into severe financial troubles.

The total debt of the Tung Group now amounts to 2.676 billion U.S. dollars, said John Guest of the Shearson Lehman Brothers Inc., financial adviser to the Tung Group. Of this, 1.431 billion dollars belongs to OOHL and 1.245 billion dollars to TPG.

The restructuring proposal recommends that full interest be paid on TPG and OOHL debt secured by the market value of their assets--the so-called senior debt--and that amortization begin in 1988.

The remainder--the undersecured and unsecured debt--would be treated equally, Guest said. They would be exchanged for interest bearing notes and for equity shares in the group.

Under the proposal, C.H. Tung, the present chairman of the Tung Group holding 12 percent shares of OOHL, would become voting trustee of the trust as well as the chief executive of the restructured group but would have no share holding in the group.

Concerning the 120 million dollar injection into the group by local magnate Fok Ying-tung announced in March this year, Guest said that Fok would invest 100 million dollars of equity in the new container business and 20 million dollars into a new company, Tung Buildings, established to accept the delivery of 12 new ships from Japan.

The creditors from Hong Kong, Japan, the United States and Europe are expected to discuss the complex proposal in the next few weeks, Guest said, hoping that the restructuring could be completed by mid-summer.

GUANGZHOU TO FORM JOINT VENTURE FINANCE COMPANY

HK090445 Hong Kong SOUTH CHINA MORNING POST in English 9 May 86 BUSINESS NEWS p 3

[By Paul Sham]

[Text] Guangzhou International Trust and Investment Corp is to form a joint venture finance company with Yue Xiu Enterprises Ltd in Hong Kong.

Guangzhou International manager Leung Yundeh said yesterday the move was part of plans by the company to expand into overseas money markets.

Yue Xiu is the representative office in Hong Kong of Guangzhou City.

Mr Leung said it had recently been decided to increase Guangzhou International's registered capital from 100 million renminbi to 400 million (about HK $968 million) to strengthen its financial base.

The projected finance company in Hong Kong will handle security trading, foreign exchange transactions, and commercial loans.

Mr Leung said further discussions would take place soon between Guangzhou International (not to be confused with Guangdong ITIC) and Yue Xiu on the details of shareholdings and profit-sharing. Agreement in principle to co-operate in the venture had been reached.

A Yue Xiu spokesman said if the plan went ahead, the venture would represent a restructuring of the financial arm of Yue Xiu. Application had been made to the Hong Kong authorities early this year.

Initially, he added, Yue Xiu has planned the finance company as its own wholly-owned subsidiary.

Mr Leung said the venture was prompted by the lengthy application procedures faced by Chinese firms wanting to set up branches outside the country.

The joint venture with Yue Xiu would be regarded as just another subsidiary of the Hong Kong based company, thereby eliminating complicated paperwork in China.

Also included in Guangzhou International's expansion plans are trust investment for overseas Chinese, insurance, leasing, and management of funds denominated both in renminbi and foreign currencies.

The company is also planning to issue bonds in foreign countries to enlarge its financial base, said Mr Leung. In this it will be following the examples set by Fujian Province and Shanghai. A fact-finding team has been sent to Japan.

Guangzhou International is planning to raise U.S. $70 million this year from foreign sources, of which U.S. $40 million will be short-term borrowings.

Its role as guarantor for loans from foreign banks is expected to increase with the sums under guarantee reaching U.S. $200 million this year. The company guaranteed 11 projects in 1985.

Total profit this year is expected to amount to 12 million yuan, an increase of 7.6 percent over last year's figure.

Yue Xiu, meanwhile, is planning to set up branch offices in Los Angeles and Singapore, according to its spokesman.

OFFICIAL NOTES INVESTORS' CONFIDENCE

OW242152 Beijing XINHUA in English 1638 GMT 24 Apr 86

[Text] Hong Kong, 24 April (XINHUA) -- A senior Hong Kong official said that the confidence of the private sector in maintaining their investment here continues to be forthcoming, the Hong Kong Government Information Services reported here today.

Addressing a meeting in San Francisco Wednesday, Deputy Chief Secretary Alan Scott said, "As a result of private investment, work on a 260 million U.S.-dollar expansion of our container port -- already the third, and expected to become the second, in the world -- began in 1985."

He went on to say, "A joint-venture project between Guangdong (Province) and Hong Kong's China Light and Power Company is under way for the construction of a nuclear power station 30 miles across the border."

When completed, the station will provide electricity for consumers in both Hong Kong and Guangdong into the next century, he told the meeting.

Private investors from Japan, the Chinese mainland and Great Britain, he said, will begin work later this year on a 390 million U.S.-dollar second road rail crossing under the harbor, linking Honk Kong Island with Kowloon.

The objective of the government here, he stressed, is a smooth transition for the territory in 1997, without social, economic or political dislocation.

China will resume its sovereignty over the whole of Hong Kong by 1997 under the Sino-British joint declaration.

The deputy chief secretary said, "The Hong Kong Government has been investing heavily, as always, in infrastructure, with long-term plans for transport, education, medical and social services."

Transport and communication links with China are being strengthened, he said, adding that road, rail and ferry services (which carried 15 million people to the Chinese mainland last year) are being improved.

FINANCIAL SECRETARY COMMENTS ON DAYA BAY NUCLEAR PLANT

HK080411 Hong Kong SOUTH CHINA MORNING POST in English 8 May 86 p 1

[By Frank Choi]

[Text] The government will have to be open and prepared to make facts about the Daya Bay nuclear plant transparent, the financial secretary, Sir John Bremridge, told the Legislative Council yesterday.

Sir John said secrecy was a menace and the combination in the Soviet Union of secrecy and incompetence had done the world a disservice.

Replying to 13 supplementary questions originated by Miss Maria Tam's query on safety measures at Daya Bay, Sir John said: "There is widespread concern and governments everywhere must be prepared to explain the position clearly so there can be a proper degree of public reassurance."

He said: "Secrecy is absolutely out of the question.

"I think the Russians dropped a stone on their own feet in trying to preserve secrecy for the first week."

He said the Daya Bay site was closer to populated areas in China than to Hong Kong and there were more plants in the world much closer to populated centers than Daya Bay was to Hong Kong.

Sir John assured Unofficials of the Guangdong Nuclear Power Joint Venture Co would not skimp on safety measures even if the construction cost went up and construction time would not be cut if progress was not going as scheduled.

He said the government considered public education about the nuclear plant was important and a study was being conducted to outline an education strategy.

Radiation monitoring equipment should be in place by the end of the year, he said.

He said the Daya Bay plant would be governed by the best international safety standards in respect of design, manufacture, erection, commissioning and operation.

These standards had been incorporated in all contracts being placed by the joint venture company.

"The nuclear equipment and nuclear design for the plant are being obtained by the company from France to take the maximum possible benefit of the successful nuclear program there and in particular of the very high safety record of the French," Sir John said.

There are now more than 40 similar pressurized water reactors operating satisfactorily in France alone, the second largest nuclear power program in the world, and there were 160 of the reactors worldwide.

He said the Daya Bay design was totally different from the one at Chernobyl in the Ukraine.

In addition, the French equipment, supplier, Framatome and the French national utility, Electricite de France (EdF), had a supervising role to ensure that specified standards were met.

Sir John said apart from French safety standards that had been adopted for the project, applicable international and Chinese standards would also be observed.

"In addition, China has established its own national licensing authority (the National Nuclear Safety Authority directly responsible to the State Council) which has a cooperation agreement with the French licensing authority (the Central Service for the Safety of Nuclear Installations) regarding the use of French standards."

China's licensing authority told the company these standards would be the basis for its licensing of the Daya Bay plant.

Sir John said all possible safeguards for design and construction of the plant to the highest international standards have been taken.

Such safety standards would apply at all stages of the project during design, construction and operation.

He said according to China's licensing regulations there were several key stages of the construction where detailed safety analysis reports would have to be submitted to the Chinese licensing authority for approval.

The safety analysis reports would be prepared according to international forms and standards, with input from the French contractors involved and under the supervision of EdF.

Construction work could not continue until the licensing authority was satisfied the standards had been met.

"This will ensure, therefore, that internationally recognised safety standards will already be attained before the plant is put into operation," he said.

Sir John said the company was responsible for the application of safety standards during the operational stage, but under the terms of the joint venture contract, the operations manager and other members of the operations staff would be nominated by the Hong Kong Nuclear Investment Co (HKNIC).

He said: "This close operational link will enable HKNIC to know the operating status of the plant, including the unlikely event of any abnormal developments."

BRIEFS

HONG KONG UNDERWRITING GROUP--A 15-member underwriting group has been formed for the $250 million commercial paper issue planned by Guangdong Enterprise (Holdings) Ltd, the Chinese province's representative office in Hong Kong. A spokesman for the company said yesterday that the agreement will be signed within the next two weeks. Banking sources said the three-year program is being lead-managed by China Development Finance Co (Hong Kong) Ltd and Paribas Asia Ltd, each of which will subscribe $27.5 million to the facility. The other 13 participating banks and financial institutions, which will each subscribe $15 million, include Bank of East Asia, Barclays Bank, Bank of Tokyo, CCIC Finance Ltd, Kleinwort Benson (Hong Kong) Ltd, Nanyang Commercial Bank, BNP, and Wardley. The issue will be in denominations of 500,000 with maturities of one to three months, and is subject to an underwritten margin of one eighth percentage point above the Hong Kong interbank offered rate. [Text] [Hong Kong SOUTH CHINA MORNING POST in English 9 May 96 BUSINESS NEWS p 3]

FIRST QUARTER TRADE INCREASES--Hong Kong, May 16 (XINHUA)--Hong Kong's total merchandise trade in the first quarter of this year was valued at 108,832 million Hong Kong dollars (about 13,952 million U.S. dollars), up 0.3 percent compared with the same period of last year, according to the territory's census and statistics department. On the same basis of comparison, domestic exports increased by one percent to 29,146 million H.K. collars (about 3,737 million U.S. dollars), while re-exports decreased by six percent to 24,005 million H.K. collars (about 3,078 million U.S. dollars), so that for total exports, the trade value decreased by two percent. Hong Kong's imports increased by three percent to 55,762 million H.K. dollars (about 7,137 million U.S. dollars). Comparing the first three months of 1986 with the same 1985 period, the statistics show that the value of Hong Kong's domestic exports to the United States increased by two percent, but the value of most commodities exported to the Chinese mainland decreased. Re-exports to the Chinese mainland decreased by 33 percent in value. The United States and the Chinese mainland are Hong Kong's two leading trading partners. BRIEFS

GUIZHOU INDUSTRY, AGRICULTURE BY 1990--Guiyang, 6 May (XINHUA)--Guizhou, an underdeveloped province in southwest China, will increase its gorss output value of industry and agriculture by 46.9 percent over the next five years, according to provincial officials. They said here today that the annual output value will reach 21.5 billion yuan by the year 1990. The focus of Guizhou's development in the next five years will be on agriculture, energy, communications, raw materials, production of consumer goods, and scientific research and personnel training, as well as economic and technical cooperation with other areas of China and foreign countries. The average annual increase of the province's gross output value of industry and agriculture in the past five years was 11.6 percent, "somewhat higher than the average national increase rate," they said. FANG YI ON TRAINING NEEDS DURING JIANGXI VISIT

OW250621 Beijing XINHUA Domestic Service in Chinese 1513 GMT 24 Apr 86

[Article by RENMIN RIBAO reporter Zhao Xiangru and XINHUA reporter Li Xingmin]

[Text] Nanchang, 24 Apr (XINHUA)--On a recent inspection tour of the copper-producing base area of Dexing and the "Pottery Capital"--the city of Jingdezhen--Fang Yi, member of the Political Bureau of the CPC Central Committee and state councillor, pointed out: Our state must mainly rely on qualified people in order to flourish. We must adopt effective measures to train a group of qualified people and allow them to play a significant role.

After attending the ceremony for the completion of the Jiangxi Guixi Smeltery, Comrade Fang Yi, accompanied by Secretary Wan Shaofen of the Jiangxi Provincial CPC Committee, visited the Dexin Copper Mine and Jingdezhen City's ancient kiln, exhibition hall of earthenware and pottery and its five porcelain plants--the Renmin, Hongqi, Jianquo, Yishu and Diaosu plants--from 17 to 19 April to understand the situation in pottery production and in the training of qualified people. Comrade Fang Yi pointed out: Pottery was invented by China, and Jingdezhen's pottery is world famous. In order to help this form of our national art to flourish, efforts must be made to train qualified people. It is a project of vital and lasting importance. We must make enormous investments in training outstanding, qualified personnel. When people of the new generation are trained, there will be no lack of successors, and our nation will rapidly flourish and Jingdezhen's ceramics industry will definitely thrive.

Comrade Fang Yi emphatically pointed out: In the course of producing pottery, we must assimilate the advanced experience of foreign countries and improve the quality of the pottery products on a timely basis. He said: Jingdezhen pottery is well known in the world for its unique designs. However, we must not stand still and refuse to make progress. We must learn from the advances of foreign countries. By bringing into full play the fine traditions of our nation and assimilating the advanced experience abroad, we will definitely be able to stand in the forefront of the world.

JIANGXI LEADERS ATTEND MEETING ON REFORM

OW271730 Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 25 Apr 86

[Excerpts] Jiang Zhuping, member of the Standing Committee of the Provincial CPC Committee and vice governor of Jiangxi, stressed at the Provincial Meeting on Urban Economic Restructure Work today: The general task of urban economic restructure in our province this year is: assimilate and supplement the reform measures which have been started; consolidate and develop the reform achievements already made; vertically, continue to simplify the administrative setups and allow lower units to have more decisionmaking power; horizontally, promote economic ties; microeconomically, do a good job in supplementary reforms and, macroeconomically, exercise more control and regulation in order to constantly invigorate enterprises and give full play to their role in the urban economy; and pay great attention to making the scheduled reforms in selected fields a success to pave the way for reforms at a comparatively faster pace in 1987 and 1988.

Jiang Zhuping called on all prefectures, cities, departments, and enterprises to enforce and intensify reforms in six aspects:

1. Make further efforts to invigorate enterprises, in particular, large and medium-sized enterprises as well as enterprises producing export goods to earn foreign exchange. Jiang Zhuping said: Invigoration of enterprises is the central link of urban economic restructure. All departments must continue to implement the State Council's 10-point instruction on expanding lower units' decisionmaking power, the 10-point instruction on promoting technical progress, and the 14-point instruction on invigorating large and medium-sized enterprises, and both 10-point instructions issued by the Provincial CPC Committee and government on invigorating enterprises, as well as the supplemental regulations on ensuring enterprises' decisionmaking power.

2. Greatly promote horizontal economic ties.

3. Open up more types of markets and make great efforts to improve commodity circulation.

4. Consolidate and assimilate the price reform measures that already have taken place and improve the methods to award wage [word indistinct] in enterprises.

5. Strengthen and improve macroeconomic control to ensure economic development and the smooth progress of reforms.

6. Do a good job in conducting exploratory reforms in selected fields to pave the way for reforms at a quicker pace in 1987 and 1988.

The Provincial Meeting on Urban Economic Restructure Work began today in Nanchang. Leading comrades Liu Fangren, Ni Xiance, Wang Baotian, Liu Junhou, Wang Shufeng, Sun Xinyue, and Liu Jianhua attended the meeting.

JOURNAL VIEWS PRESENT ECONOMIC PROBLEMS

HK281605 Beijing BAN YUE TAN in Chinese No 7, 10 Apr 86 pp 16-18

[Article by Xue Zhongxin [5641 0022 2450]: "Why Is it Necessary to Implement the Principle of 'Consolidation, Digestion, Replenishment and Improvement?'"]

[Text] The major task for reform of the economic structure this year is to "consolidate, digest, replenish and improve" the reform measures we have already adopted, and to make preparations for further reform in years to come.

In referring to consolidation, we mean that we should consolidate what we have achieved in the reforms in the past few years, adhere to the orientation of carrying out reform, and strengthen our confidence and resolve in carrying out reform. In speaking of digestion, we mean that we should, in light of the financial capabilities of the state, improve the reform measures we have already adopted in the price and wage systems, and come up with solutions to new problems. In saying replenishment, we mean that we should cement and solder some imperfect links in the reforms so that a whole range of reforms will be carried out in a coordinated manner. In talking about improvement, we mean that we should strengthen and improve overall economic control, exercise tight control over the scale of investment in fixed assets and credit so as to gain a new level and new experiences in the work.

This is a correct principle formulated in line with the present situation in our country.

At present, our country is undergoing a great change, moving from a somewhat closed condition to a condition of opening up to the world on an unprecedented scale, and turning the extensive self-sufficient natural economy into a planned commodity economy. We have launched an all-round reform in all spheres of economic and social life. This reform is making an extremely deep and extensive impact on the previous rigid economic structure, conventional ideas and people's interest relations. Establishing a socialist economic system with Chinese characteristics is a pioneering undertaking. We have no ready-made formula to follow, but have to explore new possibilities and sum up new experiences with ceaseless efforts by integrating the basic tenets of Marxism with the actual situation in China. For this reason, all our reform measures should undergo a process of exploring new possibilities and being subjected to practical tests, and should be progressively improved and replenished. On the other hand, people are allowed to adapt themselves to, and come to a correct understanding of, the reform step by step, and in particular, the reform measures that affect the vital interests of the people. This means that the economic restructuring undergoes a gradual process. We must have a correct understanding of its complex and difficult nature and must not seek quick results. Haste does not bring success, but brings more difficulties and setbacks. We must therefore look carefully before taking each step and promptly consolidate, digest, replenish and improve the reform measures we have already adopted so as to lay a solid foundation for expediting reform in the years to come.

As our present situation in economic restructuring and economic development shows, this year's reform should be designed to follow the principle of "consolidation, digestion, replenishment and improvement." Over the past few years, we have adopted a number of reform measures such as extending the decisionmaking power of enterprises in management, the establishment of various forms of the economic responsibility systems in enterprises, the introduction of the system of the director assuming full responsibility, and the implementation of the policy of opening to the world and reinvigorating the domestic economy and carried out reform in the financial, tax, price and wage systems. However, at present our country is still undergoing a period of superseding the old economic structure with the new. The new economic structure has not yet been completely built and is not yet perfect enough, and the old one still works. The reform, in general, has meant significant progress, but the emergence of new problems is unavoidable. For example, in the course of carrying out reform, we laid undue stress on stimulation of production and increase of supply, but neglected the fact that reform would also promote an increase in general demand. From the fourth quarter of 1984, our economy began to show some destabilizing factors, such as the excessively high growth rate of industrial production, the overly large scale of investment in capital construction, and the sharp increase in consumption funds. The result was a grave imbalance between demand and supply. The party Central Committee and the State Council quickly discovered the problem and took a number of macroeconomic control measures to deal with it. Thereafter, inflation of demand was controlled somewhat, but demand still outstripped supply. Destabilizing factors emerging in the national economy have not been completely eliminated. In the course of strengthening overall economic control, we "imposed uniformity" on some aspects, and some reform measures were not faithfully executed. Therefore, we must quickly discover problems and conditions arising from economic activities, sum up experiences at the right time and take timely measures to deal with them. We must eliminate the bad and play up the good from reform measures already taken, and replenish and improve them step by step.

In implementing the principle of "consolidation, digestion, replenishment and improvement," what in particular should we do?

First of all, we must enforce and improve all reform measures already adopted for invigorating enterprises, and in particular, large and medium-sized key enterprises. We must continue to carry out a number of policies formulated by the State Council to instill vitality into the enterprises. All power that ought to be delegated to enterprises should accordingly be given to them, and should not be curbed and diminished. Governments at all levels should make further efforts to streamline administration and institute decentralization, make a good job of overall planning, coordination, service and supervision, and put in order and consolidate administrative companies, and dissolve unnecessary intermediate links. Meanwhile, regulatory taxes should be gradually exempted and reduced on some enterprises. We must also raise the rate of depreciation, stop discriminatory apportioning of expenses, and lighten the burden on the enterprises. Measures to reform enterprise management should be carried out in depth. In addition, we should conduct successful experiments on the implementation of the system of the director assuming full responsibility and improve various forms of the economic responsibility system.

Second, we must enliven and expand the market and must exercise effective control over market prices. We must continue to expand the market for farm and sideline products, make further efforts to reform the vegetable purchase and marketing system, expand the wholesale market for vegetables and other nonstaples, and set up various forms of production-marketing combines. We must put commercial wholesale organizations in order; reorganize and consolidate trade centers and wholesale markets for industrial consumer goods and the means of production; turn state-owned small trading establishments and enterprises into collective or individual businesses gradually and in a planned way; and readjust tax policies accordingly. We must also promote production-marketing alliances among industrial and commercial enterprises, strengthen administrative control over all types of markets and prohibit all unauthorized dealings.

Third, we must consolidate and digest reform measures already adopted and maintain the basic stability of commodity prices as a whole. In 1985, we took a big step forward in the reform of our price system. The price reform has in general proceeded smoothly and properly and played a positive role in developing planned commodity production and enlivening the market. However, as we have been reforming prices, prices of some commodities have increased considerably. This year we will not adopt any major measures in price reform but will carry out limited price adjustments, raising the prices of some commodities while lowering those of others. Special attention must be paid to solving the problem of unduly high prices in big and medium-sized cities and effective measures must be adopted to stabilize the prices of vegetables and other nonstaples.

Fourth, we must continue to improve the wage reform introduced to government organizations and undertakings and the pay system that combines basic wages with bonuses used in industrial enterprises. In the second half of last year, the government introduced what is called the position wage system to its organizations and undertakings. The new system, which is still in its initial stages, cannot be said to be without defect, so this year we have to solve the outstanding problems that involve irrationality. Last year most of industrial enterprises adopted a new pay system combining basic wages with bonuses, while a few enterprises tried to implement the method of basing an enterprise's total payroll and bonuses on its economic performance and some other methods. This year we must concentrate on summing up experiences and solving the outstanding problems in an effort to improve the bonus-based basic wage system adopted last year so that it will be able to link closely with the economic responsibility system adopted in enterprises. Anyway, our wage system should no longer follow the practice of "eating from the same big pot." Meanwhile, we must adopt effective measures to gradually solve the problem of a yawning gap in income among people working in different enterprises.

Furthermore, we must further consolidate and develop the reform measures already adopted in the areas of foreign trade, finance and taxation. It is also necessary to strengthen and improve control of the macroeconomy. While using administrative methods, we must make better use of economic regulatory means such as banking and taxation as well as legal means so as to ensure a sound, steady and balanced development of the national economy.

HEBEI OFFICIAL SPEAKS ON DEVELOPING COOPERATIVE ECONOMY

SK260901 Shijiazhuang Hebei Provincial Service in Mandarin 2300 GMT 13 Apr 86

[Text] At the rural work conference sponsored by the provincial CPC Committee, Yang Zejiang, chairman of the provincial Advisory Commission, delivered a speech on how to further implement Document No 1 of the central authorities and to promote a sustained, steady, and coordinated development of the rural economy.

In his speech, Comrade Yang Zejiang summed up the experiences gained in the previous stage of implementing the central authorities' Document No 1 of 1986, and set forth suggestions on the three major issues of this year's rural work: First, readjust the production structure in accordance with the needs of society in order to comprehensively promote this year's rural economy; second, enhance the construction of materials and technological foundations in order to stimulate agricultural development; and third, run a village-level cooperative economy.

He pointed out: As village-level work is the most basic work, whether or not we enliven the village-level economy is of importance to the overall development of the rural economy. Upon completion of rural party rectification, we should continue to grasp the infrastructural construction among the villages. While implementing the central authorities' Document No 1 of this year, we should pay attention to lightening the burden on the peasants, solving the problems concerning arbitrarily occupying farmland, and sorting out collectively owned property. Simultaneously, we should make efforts to achieve the construction in three fields, such as setting up a cooperative service system, running village-level enterprises, and enhancing agricultural capital construction.

Comrade Yang Zejiang stressed: Starting from improving service to develop and perfect the cooperative system is an important task of this year's rural work. The cooperative system is an inevitable result of rural commodity economic development as well as the only way for the rural areas to seek common wealth. After the implementation of the household output-related contract system, some cadres do not dare to talk about cooperation. One of the important reasons is that they fail to clearly understand the essence of the cooperative economy. They mistake cooperation for the system of everybody eating from the same big pot, and consider the cooperative system as conflicting with the household output-related contract system. This kind of thinking is wrong. The current cooperative system and the original collective economy are different in pattern. The pattern of the collective economy that was carried out before the implementation of the output-related contract system was that the income of the households participating in collective labor was distributed to them in a unified manner under the public ownership system; while the pattern of the current cooperative system is that coordinated associations are organized in line with the demands of commodity production and the will of the people and on the basis of safeguarding the contracts for household management and not violating the peasants' property and economic interests. Cooperation means service as well as coordinately developing the economy. Through cooperation, commodity producers will be able to solve the problems that they themselves are not able to solve, and we will be able to give full play to the advantages of the household output-related contract system.

SHANGHAI MUNICIPAL PEOPLE'S CONGRESS OPENS MEETING

Mayor Announces Economic Targets

OW252004 Beijing XINHUA in English 1636 GMT 25 Apr 86

[Text] Shanghai, 25 April (XINHUA) -- Shanghai's annual gross domestic product is expected to total 67.3 billion yuan by 1990, double the 1980 figure, major Jiang Zemin said today.

The GDP -- the total value of all production and services in China's biggest industrial city -- should rise at an annual average of 7.5 percent during the next 5 years, he told the annual session of the Municipal People's Congress which opened today.

This percentage growth is the same at that of China's gross national product as set in the Seventh 5-Year Plan (1986-1990).

Major targets listed in the city's draft 5-year plan include:

-- annual total industrial and agricultural output should be worth 118.6 billion yuan by 1990, an average yearly rise of 6 percent. This compares with the national average of 6.7 percent.

-- the city's net income from goods and services should total 57.2 billion yuan by then, an average annual increase of 6 percent, compared with a yearly rise of 6.7 percent in national income.

Jiang said: "Over the next 5 years, we will concentrate on modernizing and expanding 161 key enterprises."

Their products include textiles, foodstuffs, household electrical appliances, generating equipment and vehicles.

He continued: "Meanwhile, we will try to develop at least 2,500 new products for Chinese and foreign markets, and speed up development of high-technology industries."

Under the 5-year plan, Shanghai will spend 10 billion yuan on public facilities, the energy industry, communications and housing projects -- 65 percent more than in the 1981-1985 period.

New communications will include a new airport terminal, wharves, a railway station, a second tunnel under the Huangpu River and telephone switchboards with 600,000 new lines.

The city will also build 400,000 apartments with a total floor space of 22 million square meters, and install power generating units with a combined capacity of two million kilowatts.

Jiang added: "We aim to make 9-year compulsory education universal over the next 5 years."

More Foreign Exchange Sought

OW251954 Beijing XINHUA in English 1621 GMT 25 Apr 86

[Text] Shanghai, 25 April (XINHUA) -- The major industrial city of Shanghai will raise more foreign funds over the next 5 years to boost its modernization drive, Major Jiang Zemin said today.

The exact amount of the funds to be used will depend on the city's ability to earn foreign exchange through exports, he told the opening meeting of the fifth session of the eighth Shanghai Municipal People's Congress.

He said the money would be spent mainly on improving infrastructure, modernizing factories and boosting exports and services, including tourism and cultural facilities.

"We will be both active and cautious in raising foreign funds and take into consideration of the balance in foreign exchange and our ability to repay them," the mayor said.

Shanghai introduced 1.27 billion U.S. dollars worth of foreign funds during the past 5 years.

Jiang said the development of exports and tourism was an important means of boosting the city's foreign exchange income.

Annual exports earnings were expected to increase from 3.3 billion U.S. dollars last year to 4 billion dollars by 1990.

The city aimed to attract 1,600,000 overseas tourists in 1990, compared with 600,000 last year.

Mayor Jiang said the central government had recently approved the city's construction plan, which involved large-scale development in central urban areas and satellite towns.

Shanghai produces one ninth of China's total industrial output value and earns a sixth of its income.

LIAONING GOVERNOR QUAN SHUREN ATTENDS ECONOMIC SEMINAR

SK260935 Shenyang Liaoning Provincial Service in Mandarin 1030 GMT 25 Apr 86

[Text] At a seminar on Liaoning Province's lateral economic cooperation which concluded in Jinzhou yesterday, Governor Quan Shuren pointed out: It is necessary to enhance our awareness of developing lateral economic cooperation, to eliminate ideological obstacles and misgivings, and to raise our perceptual knowledge to rational knowledge.

Quan Shuren said: Over the past few years, our province has greatly developed its lateral economic cooperation. However, we still lack an adequate understanding of the importance of such a new thing as lateral cooperation, which is mainly manifested in the following fields: Some departments and localities have proceeded with their work from partial and immediate interests and made it a rule that cooperation can only be established among enterprises of their own departments and localities. They have also restricted enterprises to develop cooperation with other localities and departments. Some large enterprises have feared that developing cooperation will create competitors and that some medium-sized and small enterprises will not be subject to their control after they become full-fledged or independent, thus imposing a mental burden on them. Some enterprises lack long-term viewpoints, seek no improvements, are satisfied with the present not-too-bad situation and lack a sense of urgency in developing cooperation. Some other enterprises have competed with one another to become the leader and have failed to get down from their high horses and to give up the thinking of posing themselves as the leaders. First, some small enterprises and township enterprises have considered establishing cooperation with other units as an expedient measure for tiding over an impending difficulty. Owing to their lack of sincerity in establishing long-term cooperation, they have even stopped their cooperation and retreated when the situation has improved. Second, they have worried that they might be changed from small but comprehensive enterprises into small units producing only a certain special kind of product and be swallowed by large enterprises and might lose their positions after they have established cooperation.

Governor Quan Shuren stressed and pointed out: Establishing lateral economic ties is necessary for developing the socialist commodity economy and for carrying out socialized large-scale production. Establishing lateral cooperation is an important task of strategic significance and is our orientation in the economic reform. We should encourage cooperation in terms of policies and safeguard it in terms of laws in order to achieve a greater development in our province's lateral [word garbled].

CONFERENCE BOOSTS DRIVE TO DEVELOP ISLAND ECONOMIES

HK070510 Beijing CHINA DAILY in English 7 May 86 p 1

[By staff reporter Guo Zhongshi]

[Text] A major drive to lift the country's numerous islands out of economic backwardness and poverty was given a further boost at a national conference that opened in Beijing yesterday.

The move is accompanied by an over-all plan to upgrade industry, agriculture, energy, transport and marine farming on China's more than 500 inhabitated islands except Taiwan. Most of these islands are located along the country's central and southern coast.

Tu Fengjun, director of the Bureau of Aquatic Products under the Ministry of Agriculture, Animal Husbandry and Fisheries, told the conference in a keynote speech that priority should be given to reclaiming 70,000 hectares of unexploited shallow sea so as to add 14,000 hectares of marine farms within five years, doubling the present area. "Then, marine farming alone will turn out 150,000 tons more seafood," he said.

Besides building up a diversified production of local delicacies, he urged islanders to set up township enterprises, especially ones involved with food, fodder, transport and marketing [to] back up the fishing industry.

Enterprises requiring low investment and energy input while providing fast economic returns should also be set up to offer more employment on the islands.

Tu said the policy encouraging individual businesses to work toward a common purpose would continue in a bid to develop a coordinated economy linking fishing, related industries and marketing.

China boasts rich fisheries and energy resources on its islands. However, most of these resources are underexploited because of the lack of advanced technology and investment, and poor transport facilities.

Only 14,000 hectares out of a possible 90,000 hectares of exploitable shallow sea areas are now being used as breeding farms, but management is inefficient and profits low.

Tu said most islanders were overfishing, which destroyed the ecological balance. Besides, the problems of transport, processing and marketing, which already hindered the development of the fish processing industry, were aggravated by the high cost of electricity and the lack of fresh water, he said.

The amount of seafood that rots because of inadequate refrigeration was estimated at about 200,000 tons a year, some 10 percent of the country's total seafood catch, according to an official from the China Society of Oceanology Studies.

The shortage of funds for investment was mainly caused by high costs in the fishing industry; a large fishing boat costs nearly 1 million yuan to build, he said. And then natural disasters can wipe out years of investment.

Tu said one typhoon last year destroyed some 300 boats in one Zhejiang Province county as there were no wind shelters.

Over the past 10 years, the bureau had invested some 100 million yuan (about $30 million) in the construction of ports, refrigerated warehouses, shipyards, electricity facilities and educational courses, he said.

Educational departments, Tu said, would step up training for fishermen, provide information and consultancy services to help build up the country's fishing strength.

Plans are also being drawn up to utilize energy resources such as wind, solar and biological energy.

BAN YUE TAN ON REFORM, 7TH 5-YEAR PLAN

HK260406 Beijing BAN YUE TAN in Chinese No 7, 10 Apr 86 pp 4-6

[Commentator's article: "Striking Up a New Movement of Reform--Greeting the Successful Opening of the Fourth Session of the Sixth NPC"]

[Text] The spring of the Year of the Tiger arrived together with the waves of reform. With the sonorous singing of spring, the Fourth Session of the Sixth NPC opened in the atmosphere of victory in Beijing. The supreme organ of power of the state will finally approve the Seventh 5-Year Plan for our national economic and social development. This will unfold a new page in the annals of China's modernization process in modern times.

China in the eighties is the focus of world attention. The whole world is pricking up its ears to listen to China's march of reform, which is full of pride, confidence, courage, and passion. The splendor of reform shone in every step of process of fulfilling the Sixth 5-Year Plan that we have just completed. In the past 5 years, the achievements in the national economy enabled us to properly solve many difficulties and problems we could not solve for a long time in the past.

In the past 5 years, through reform, we have solved the problem of providing sufficient food and clothing for the people, an issue that could not be solved properly for many years, or even for many dynasties. The masses can now enjoy a happier life as they can eat their fill and wear better clothes. Most of the people have become better off.

In the past 5 years, through reform, the situation in which the markets were short of goods but full of ration coupons of all kinds and lines of shoppers has been resolved. At present, our markets are brisk, with business turnover increasing markedly. Economic activities are full of vigor.

In the past 5 years, through reform, we have basically overcome the serious disproportions between major sectors in the national economy, and have gradually rationalized the ratios between agriculture, light industry, and heavy industry and the relationships between production and livelihood and between accumulation and consumption. This has aroused the people's working enthusiasm.

Through reform, we have not only successfully fulfilled the Sixth 5-Year Plan, but have also made remarkable achievements that we did not expect when we began to carry out the Sixth 5-Year Plan.

Reform has emancipated the productive forces, has raised the living standards of the people, and has brought about an unprecedented dynamic situation in our modernization construction.

Our reform during the period of the Sixth 5-Year Plan has won an initial victory and we have played the overture in the Sixth 5-Year Plan. The movement of reform played in the Seventh 5-Year Plan will be more sonorous and majestic. The period of the Seventh 5-Year Plan will be a crucial period for us to change the economic structure from the old pattern to a new pattern, and advancing and deepening the reforms is the key to success in this regard. In the 100,000-character text of the Seventh 5-Year Plan, reform is placed in a leading position as the most important task among others, and the spirit of reform runs through the entire plan. The Seventh 5-Year Plan more clearly and fully specifies the tasks, objectives, steps, and measures of reform.

The reform blueprint outlined in the Seventh 5-Year Plan includes the following three major points:

First, continuing to strengthen the vigor of all enterprises, especially the large and medium-sized enterprises owned by the whole people, so as to really turn them into relatively independent economic entities which are socialist commodity producers and dealers with full decisionmaking power to operate their business and with sole responsibility for their profits and losses. So long as the millions of enterprises become dynamic in their economic activities, the overall economic situation in our country will certainly be brisk and prosperous.

Second, further developing socialist commodity markets and gradually perfecting the market system. The enlivening of commodity circulation will certainly give a great impetus to the development of the commodity economy.

Third, gradually shifting the main form of the state's management over enterprises from direct control to indirect control, and establishing a new socialist macroeconomic management system. This will enable our state to manage the economy in a more scientific and effective way which is better suited to the requirements of the development of the commodity economy.

By fulfilling the above-mentioned reform tasks, we will be able to establish a vigorous and dynamic socialist economic structure with Chinese characteristics.

The objectives are grand and the tasks are arduous. As Premier Zhao pointed out in his Government Work Report, "Reform is an extensive, profound, and protracted change on a large scale. It will produce an unprecedented impact on all established patterns, traditional concepts, and forces of habit." Therefore, it is conceivable that with its in-depth development, our reform will encounter various difficulties. There is an evolutionary process in the dying out of the old system and the birth of the new system. In the transition stage, the old and the new are bound to entwine and thus bring about a variety of complicated contradictions. When the new system has not become mature enough and the old system has lost part of its function, various loopholes may appear in the field of management. Some lawbreakers may take advantage of these loopholes; some people whose vested interests are affected may resist reforms; some people whose minds are still bound by ultraleftist and ossified ideas may be discontented with reforms; some people may misunderstand reform when they find that some reform measures cannot achieve expected results; and some people may have misgivings when they see individual errors appearing in the experiments of the new system...therefore, we should fully realize the arduousness and complicatedness of reform, and should earnestly help the people to understand reform. We must not be frightened out of our wits when seeing some problems in the course of reform and must not give up our reform efforts half way for fear of some slight risks and backtrack to the old path.

Reform must be advanced through explorations; experience can only be accumulated through practice; and victories can only be won through hard struggle. Reform is in line with the fundamental interests of most people in China. So long as we carry forward the pioneering spirit, cherish a realistic and scientific attitude, plan carefully, act prudently, correct errors promptly, readjust various interest relations properly, maintain close ties with the masses, and overcome bureaucratism, then we will reduce the obstructions to the minimum and arouse the initiative and enthusiasm of all people in our country to achieve our objectives.

There will also be pain and obstacles in a time of reform, but more importantly, reform will bring us hope and benefit, and will usher in China's major economic development.

Premier Zhao Ziyang profoundly predicted in his report to the NPC session: "Reform is not only of immediate significance, more importantly it is of significance in the economic development and prosperity in the nineties and in the fulfillment of the grand objective by the end of this century. It will have a decisive influence on our efforts to approach and catch up with the level of the world's advanced countries in the economic and technological fields in the first half of next century."

The new movement of reform has been played in the Great Hall of the People. The 1 billion Chinese people will be united more closely under the leadership of the CPC to make joint efforts for the successful fulfillment of the grand Seventh 5-Year Plan and for the motherland's rise and development.

QINGHAI PLANNING, FINANCE CHIEFS REPORT TO PEOPLE'S CONGRESS

HK250143 Xinjing Qinghai Provincial Service in Mandarin 2330 GMT 24 Apr 86

[Excerpts] The Fourth Session of the Sixth Provincial People's Congress held its third full gathering on the morning of 24 April. (Yang Shengjie), chairman of the provincial Planning Commission, gave a report on the execution of the province's 1985 plan for national economic and social development and the draft of the 1986 plan. (Wu Haiyan), director of the provincial finance department, reported on the final accounts for 1985 and the budget for 1986.

(Yang Shengjie) said in his report: Comparing 1985 with 1984, the province's total social output value rose by 18.1 percent, total industrial and agricultural output value rose by 16.7 percent, and national income rose by 14.6 percent. Gross domestic output increased by 18.8 percent. Local financial revenue increased by 40.1 percent. All these figures represented overfulfillment of the 1985 targets laid down in the Sixth 5-Year Plan.

(Yang Shengjie) said: The main tasks for 1986, the first year of the Seventh 5-Year Plan, are to continue to carry out reform of the economic structure, consolidate, digest, replenish, and perfect the reform measures that have already emerged, control the scale of investment in capital construction, readjust the investment structure, and strengthen agriculture, animal husbandry, and infrastructural industries such as energy. We must improve work regarding economic regulation, information, and forecasting, do a good job in macroeconomic control, strive to increase output of best-selling products, and promote exports and trade. We must do well in reforming the structures of science and technology and education. We must strive for a sounder output growth rate, a marked improvement in economic results, and continued betterment of living standards, and make an excellent start to the Seventh 5-Year Plan.

In his report, (Wu Haiyan) said that Qinghai's economic construction registered healthy development in 1985 in line with the goals set by the 3d Plenary Session of the 12th CPC Central Committee. We must do a good job in the following respects in 1986: 1) Consolidate, digest, replenish, and perfect the fruits of reform already achieved and further perfect the financial and taxation system. 2) Further invigorate the enterprises, especially the large and medium state-owned enterprises. 3) Get a good grasp of increasing income and economizing expenditure and ensure balanced budgets. 4) Persevere in building the two civilizations simultaneously, strengthen the building of the cadre force, improve leadership style and methods, and improve the standard of financial work.

PLANNING COMMISSION REPORTS ON PROGRESS OF KEY PROJECTS

OW300900 Beijing XINHUA in English 0802 GMT 30 Apr 86

[Text] Beijing, April 30 (XINHUA)--China spent 3.04 billion yuan on 190 key projects in the first three months of this year, according to the State Planning Commission.

The 190 schemes include 74 concerning energy, 39 transport and telecommunications, 36 raw materials industry and the rest involving science, education, culture, public health and defense.

Six major oilfields achieved a total drilling footage of 1,900,000 meters, beating the target for the first quarter.

Fifteen large coal mines being modernized and expanded have also beaten targets for the first quarter, tunneling 1,200 meters more than in the same three months last year.

Efforts are being made by the Ministry of Water Resources and Electric Power and other departments to put into operation this year power generating units with a total capacity of five million kilowatts.

SHAANXI SUCCESS NOTED IN TAX INSPECTION, FINANCES, PRICES

HK050745 Xian Shaanxi Provincial Service in Mandarin 0030 GMT 2 May 86

[Excerpts] The whole province scored marked achievements in the large-scale inspection of taxes, finances, and commodity prices. From July last year to the end of April this year, the whole province found violations of discipline which involved some 264.9 million yuan, discovered some 160 million yuan which should have been paid to the treasury, and found that some 127 million yuan had been paid to the treasury.

Through this large-scale inspection of taxes, finances, and commodity prices, the whole province discovered, investigated, and dealt with a large number of large and serious cases of violations of the economic law and conducted extensive education in the concepts of policies, the legal system, and the overall situation, promoting the building of spiritual civilization.

Through inspection, the problems discovered mainly included evasion of taxes; arrears of taxes; indiscriminate apportioning of costs; indiscriminate listing of charges; withholding and misappropriation of income which should have been paid to the state; making fraudulent and false applications and claims for state subsidies; turning what was covered by the budget to what was not covered by the budget; turning state property to collective property; turning collective property to individual property; pursuing private ends for small groups and individual capital and special fund for production of nonproductive purpose and so on. All kinds of companies, centers, and markets which had been set up over the past few years managed their finances chaotically, benefited themselves at public expense and seriously violated the law and discipline. Some indiscriminately raised prices, and apportioned charges, and engaged in illegal dealings. Some indiscriminately issued bonuses and goods and privately shared the state income. Some bought commodities, the purchase of which was under control, without approval. Some committed graft, theft, speculation, profiteering, and so on.

With a view to continuously and penetratingly carrying out the province's large-scale inspection of taxes, finances, and commodity prices, on 30 April, leading comrades of the provincial government listened to a report made by a responsible comrade from the office of the provincial large-scale inspection of taxes, finances, and commodity prices. He fully affirmed the achievements of this large-scale inspection, and emphatically pointed out: In future, we must regard the large-scale inspection of taxes, finaces, and commodity prices as long-term and regular work. To uphold the law and discipline, to promote the fundamental improvement of party style and the general mood of society, and to guarantee the smooth progress of economic structure reform, the provincial government has decided that large-scale inspection leadership groups and offices at all levels should not be abolished and should remain as permanent organizations. All monies which should be paid to the treasury must be promptly paid to the treasury. Those who refuse to pay them to the state must be severely dealt with. The large and serious cases must be thoroughly and clearly dealt with. It is necessary to specially inspect the grain, [words indistinct], and labor service companies this year. On this basis, it is essential to carry out all-round inspection.

ANHUI REGULATIONS ON COMMODITY CIRCULATION

OW041113 Hefei ANHUI RIBAO in Chinese 18 Apr 86 p 1

[Excerpts] The provincial party committee and the provincial government recently issued a joint statement outlining the following 12 regulations on promoting reform in commodity circulation and facilitating commodity flow:

1. It is necessary to give full play to the leading role of state-run businesses and supply and marketing cooperatives in urban and rural commodity circulation.

2. Reform should be conscientiously carried out in the wholesale system of state-run businesses.

3. Supply and marketing cooperatives should be developed into cooperative economic organizations that truly belong to the peasants.

4. Continuing efforts should be made to promote collective and individual businesses.

5. New circulation channels and commercial forms should be actively explored.

6. Commercial enterprises should be further invigorated.

7. Small commodity production and trading should be emphasized.

8. Construction and transformation of the commercial infrastructure should be stepped up.

9. Financial, taxation, and banking departments should support the commercial departments in speeding up commodity circulation.

10. Pricing, industrial, and commercial departments should start from commodity circulation in strengthening pricing and market control.

11. The economic contract system in the field of commodity circulation should be further improved.

12. It is necessary to step up leadership and provide careful guidance.

The "regulations" issued by the provincial party committee and the provincial government stress the need to:

1. Persist in reform, particularly in the reform of the wholesale system of state-run enterprises. Specialized wholesale companies or stores should be formed gradually. State-run large and medium-size retail enterprises can also deal in wholesale business.

2. Vigorously promote lateral economic cooperation. New interregional and interdepartmental agricultural, industrial, and commercial establishments and conglomerates consisting of these three establishments should be set up on a trial basis. Cities and towns should open all kinds of specialized commodity, agricultural, trading, and wholesale markets. It is necessary to boldly explore new avenues of combining domestic and foreign trade.

Renovation and expansion of commercial outlets should be treated like the technical innovation of industrial enterprises. As such, they should be incorporated into planning. The scale of such commercial outlets to their corresponding land plots may be appropriately adjusted. Proper arrangements should be made in connection with the funds needed for maintaining, renovating, and decorating commercial outlets, so that use of the money is centralized in the hands of competent city and county departments.

The "regulations" issued by the provincial party committee and the provincial government also urged party committees and governments at all levels to handle commodity circulation with the same devotion as they handle industry and agriculture. All prefectures, cities and counties should appoint a leading comrade to take charge of financial and trade matters. That leading comrade should personally get involved in matters concerning the production, marketing, and pricing of supplies and commodities that are vital to the production and living of most people. If he discovers problems, he should promptly solve them to ensure the stability of socioeconomic activity. At the same time, it is necessary to develop commercial enterprises into the "windows" on socialist material and spiritual civilizations by persisting in building the two civilizations and by effectively stepping up ideological and political work in commerical circulation departments.

PAPER REPORTS ON COOPERATION BETWEEN COASTAL AREAS, INTERIOR

HK250833 Xian XIBEI XINXI DAOBAO in Chinese 14 Apr 86 p 4

[Report quoted from GUANGDONG TEQU DONGTAI: "Ten Tendencies in Economic and Technological Cooperation Between the Coastal Areas and the Interior"]

[Text] First, the coastal areas and the interior jointly develop coal, nonferrous metals, ferrous metal, and energy resources as well as produce raw materials. The coastal areas chiefly provide funds for the development.

Second, the coastal areas transfer technology to the interior. In the coastal areas, the technology of such trades as light industry and textile, machine building, chemical industry, electronics, food, and building materials industry is advantaged. In particular, various types of processing industries of the coastal areas are welcomed in the interior.

Third, the technological advancement of the interior can be promoted by arranging the sales of famous and high-quality products in various provinces and cities.

Fourth, the interior's core enterprises engaging in the national defense industry transfer advanced technology and products to the coastal areas.

Fifth, for the sake of easing the tense demand for electricity, the coastal areas gradually provide and transfer to the interior the technology and equipment for producing high energy consumption goods such as calcium carbide. In return, the interior provides corresponding products to the coastal areas.

Sixth, they jointly develop the "golden coast." First the interior invests in the expansion of ports in the coastal areas and builds export bases. Second, the interior invests in and develops beaches along the coast.

Seventh, after several contacts, various provinces and cities along the banks of Changjiang have decided to fully develop the "golden waterway" and to build the Changjiang basin into China's largest industry-intensive area.

Eighth, the export of labor is becoming more brisk. The type of physical labor export is gradually replaced by that of mental labor export.

Ninth, the coastal areas have a large number of colleges, universities, and research institutes, which is more favorable in terms of technological force. They can therefore train scientific and technological personnel, as well as management staff, for the interior.

Tenth, both the coastal areas and the interior invest in each other's area, such as running tourism and shopping arcades, building trade centers, and greatly developing tertiary industry.

GUANGXI AGREES ON MEASURES TO HELP POOR AREAS

OW300734 Beijing XINHUA in English 0716 GMT 30 Apr 86

[Text] Nanning, 30 April (XINHUA)--Authorities in Guangxi Zhuang Autonomous Region have agreed on various measures to help poor rural areas, a regional official said here today.

The measures include exempting poor households from agricultural taxes, and freeing rural enterprises and individually-run businesses in poor areas from paying income tax.

And enterprises opened in the areas by government units or individuals from other places will enjoy income-tax exemption for between 3 and 5 years.

Poor households in the region refer to those whose average annual per capita grain ration is below 200 kilograms and income below 120 yuan. Guangxi as a whole is regarded as being an underdeveloped region.

The regional authorities will spend 150 million yuan this year helping the poor areas with economic development, communications and improvement of drinking water.

Attention will also be directed to the areas' scientific and educational development, said the official. Authorities will make further efforts to promote primary, secondary and vocational education.

Meanwhile, some young and middle-aged intellectuals from the areas will be sent to study at institutes or colleges in more developed areas.

More college and vocational school graduates will be sent to the poor areas, and preferential treatment will be given to experts in education, technology and management who work in these areas.

COMMERCIAL BUREAU ENCOURAGES CONSUMER COMPLAINTS

OW051833 Beijing XINHUA in English 1504 GMT 5 May 86

[Text] Beijing, May 5 (XINHUA)--A municipal crackdown on tie-in selling has almost eliminated the problem in Beijing, according to an official of the Commercial Bureau.

Only one shop was discovered still practicing the tie-in selling of cigarettes among the 600 shops examined over the past week in the Xuanwu District.

Since April 23, the municipal authorities adopted a series of emergency measures to ban shops from forcing consumers to purchase inferior goods when they want to buy quality products. These measures follow strong complaints from consumers and intensified coverage by the press.

According to the commercial bureau official today, the telephone lines for consumers to voice their complaints and report hard selling have not been used since last Monday.

Thousands of officials implemented the city council's regulations in different corners of the capital.

Tie-in selling has died in most areas, the official said. Only a collectively-run restaurant and four peddlers were still found practicing hard selling in the Chongwen District.

A manager told the reporter that the fundamental solution is to ensure that the price of goods must be in accordance with their real quality.

BRIEFS

3 CHIEFS FOR KEY ENTERPRISES--Wei Jianxing, director of the CPC Central Committee Organization Department, recently said that it is necessary to provide "three chiefs" (chief engineers, chief economists, and chief accountants) for China's 3,000 key enterprises. This is an important measure for strengthening business management of the enterprises after reorganization of their leading groups. He said that the "three chiefs" are important members of the leading groups of the enterprises and have both titles and power, just as deputy managers of the enterprises do. The relevant departments must make proper plans in this respect. Enterprises which have the proper conditions must be provided with three chiefs promptly, and enterprises which temporarily have no conditions must grasp the work of training talented people. At present, more than 70 percent of the country's 3,000 key enterprises, whose output value accounts for 45 percent of the national total industrial output value, have been provided with chief engineers; 20 percent of them have been provided with chief accountants; and 8 percent of them have been provided with chief economists. ECONOMIC LAWS PUBLICITY URGED--Beijing, 24 Apr (XINHUA)--Chief officials of more than 20 units under the State Council gathered today at the Great Hall of the People to discuss study and propaganda of the economic laws. They maintained that it is essential to apply the law to economic management in the course of the ongoing reform of the economic structure. Comrades of the economic departments at all levels must pay due attention to this issue, and all the leading cadres, in particular, must learn how to manage the economy in accordance with the law, they stressed. At the meeting, Zou Yu, minister of justice, pointed out: Comrade Deng Xiaoping's instruction on simultaneously grasping construction and the legal system is of great importance and far-reaching significance in strengthening China's legal system and building socialism with Chinese characteristics. He held that law is a necessary way to manage the economy in the course of reform of the economic structure. Success in reform of the economic structure cannot be ensured should we bypass the law. Zou Yu hoped that comrades in the economic departments would pay particular attention to study of the economic laws. He also urged the central organs to setan exemplary role in publicizing knowledge on law, and the leading cadres at or above department and bureau levels to take the lead in studying the law. MODERNIZATION OF OLD PLANTS--Beijing, 29 April (XINHUA)--State spending on technical modernization at existing factories is rising much faster than investment in new industrial construction, according to official figures just released. According to the state statistical bureau, state-owned enterprises carried out capital construction investment of 9.4 billion yuan during the first three months of this year -- a 9.5 percent increase over the same period in 1985. Meanwhile, the enterprises spent 4.1 billion yuan on technological transformation -- a 47 percent increase. During the first three months, spending on the development of new products and improvement of product quality came to 670 million yuan and 240 million yuan respectively, increases of 173 percent and 89 percent over the same period last year. Investment aimed at boosting production rose by 21 percent. [Text] [Beijing XINHUA in English 1055 GMT 29 Apr 86] /12640

BANK OF CHINA BOOSTS TOTAL ASSETS PROFITS

OW281804 Beijing XINHUA in English 1440 GMT 28 Apr 86

[Text] Beijing, 28 April (XINHUA)--The total assets of the Bank of China, China's foreign exchange bank, reached 260.5 billion yuan last year, 30 percent more than the year before, according to figures just released.

The bank earned a net profit of 1.843 billion yuan last year, 23.31 percent more than in 1984, the figures show.

Of the total assets, the interbank deposits amounted to 49 billion yuan, or 27 percent of the net value of the assets.

This shows that the bank has a sound payment capability, said a bank official.

The bank supplied loans and overdrafts totalling 94.7 billion yuan in 1985, an increase of 53.49 percent over the year before.

Securities and investments in 1985 amounted to 16.3 billion yuan, 57.88 percent more than in 1984.

Sundry accounts receivable and accounts receivable under forward contracts reached 13.3 billion yuan, up 52.7 percent, which shows the further advances of the bank's forward exchanges, said the official.

The bank's capital increased to three billion yuan in 1985 from one billion yuan in 1984. This increase was allocated by the state.

The Bank of China has established correspondent relationships with 3,461 banking institutions in 152 countries and regions. It has 29 branches abroad.

STRONG URBAN, RURAL MARKETS--Beijing, 20 May (XINHUA)--Both urban and rural markets have shown record growth in the first quarter of this year, according to the State Administration of Industry and Commerce today. Statistics from 200 of the more than 60,000 urban and rural markets in the country show that the total volume of transactions reached more than 2.3 billion yuan, over 48 percent more than in last year's first quarter. Biggest increases, ranging from 31 to 254 percent, were reported in meat, poultry and eggs, aquatic products, vegetables and fruits. The amount and value of edible oil transactions in rural markets were more than 50 percent higher than the same period last year. Wholesale markets in Beijing, Tianjin and other major cities also showed renewed vigor. Tianjin reported a 64.7 percent increase at a wholesale market in Hexi District. Beijing's biggest wholesale market, Taipingzhung, handled 1,760 tons of vegetables and fruit in 20 days, four times the volume reported in March of last year. FUND MARKET SUPPORTS TOWN--Beijing, 21 May (XINHUA)--A fund market is taking shape in Wenzhou City, in East China's Zhejiang Province, to attract and accumulate social funds to promote the development of township and family enterprises in the area. According to the overseas edition of today's PEOPLE'S DAILY, the fund market functions through circulation channels including rural credit cooperatives and other local cooperative financial organization, in addition to state banks. Over the past months, the Chinese press has discussed the possibility of experimenting with using cooperative funds to supplement funds from state banks. In Wenzhou, the rural credit cooperatives expanded their services of floating interest loans and provided 264 million yuan in such loans in 1985. A credit service department, a cooperative financial organization, was set up in October 1984 in Wenzhou. It has provided loans of more than 13 million yuan since then. Through selling shares and issuing bonds, Wenzhou also collected some 170 million yuan in 1985 to be distributed as loans. The banks provided loans of 10.76 million yuan to scores of township enterprises to help them tide over financial difficulties. [Text] [Beijing XINHUA in English 1155 GMT 21 May 86 OW] /12913

TIANJIN'S NI ZHIFU VISITS INTERNATIONAL DEPARTMENT STORE

SK071239 Tianjin TIANJIN RIBAO in Chinese 21 Apr 86 p 1

[Text] On the afternoon of 20 April, Ni Zhifu, Wu Zhen, Nie Bichu, Zhang Zaiwang, Zhang Huaisan, and other leading comrades of the municipal CPC committee, the municipal advisory commission, the municipal people's congress, the municipal people's government, and the municipal CPPCC committee visited the International Department Store, which will soon open for business.

Vice Mayor Li Lanqing introduced the purpose and the aim of the International Department Store, as well as the distinguishing features of its management. This department store will obtain technical and consumer market information mainly through importing advanced foreign consumer goods for daily use in order to promote the municipality's production of consumer goods, to effect great development in the varieties, designs, and quality of our consumer goods through many years of efforts, and to enable still more commodities to enter international markets. This department store will serve as the window for gaining commodity and technical information, consumer information, and information on international markets.

On 20 April while visiting the department store, Ni Zhifu, Wu Zhen, and others viewed with great interest the 16 commodity counters at the first and second zones of the department store, as well as the foreign commodity exhibition and sales counter at the third zone. They praised the department store for its exploiting others' superiorities to promote the development of the municipal daily necessities industry and to enliven market management.

SHENYANG TECHNOLOGY FAIR--Shenyang, 21 April (XINHUA)--A technological exchange fair aimed at promoting inter-regional co-operation and helping small and rural enterprises opened in this capital of Liaoning Province today. The 6-day fair is being attended by 450 exhibitors, and is expected to attract up to 200,000 people from across China, according to an organizer. It is the first of its kind to be held in north-east China, and features machine-building, farm machinery, textiles, food processing, petrochemicals, building materials and light industries. Participants will receive help in organizing technology transfer, technical consultancy, bidding for solving technological problems, recruitment of technicians, exchanges of technological and economic information, and marketing of new products. They will also be able to hold negotiations on the establishment of economic co-operatives. The fair is being sponsored jointly by the state council's north-east China economic zone (comprising Liaoning, Heilongjiang, and Jilin Provinces, and Inner Mongolia Autonmous Region) planning office together with 70 other organizations. ZHEJIANG JOINT VENTURES WITH FRG STATE SET PRECEDENT

Duesseldorf HANDELSBLATT in German 25-26 Apr p 13

[Article by Peter Seidlitz: "The Network of Partnership Contacts and Agreements is Becoming Denser"]

> [Text] The minister-president of Schleswig-Holstein, Uwe Barschel, is of the opinion that the heads of German states can render quite useful services in the foreign trade sector. Particularly in the case of state-trading countries he sees the possibility to help the domestic export industry through political involvement. Barschel made this comment in a conversation with the HANDELSBLATT in Hongkong on Thursday, after the conclusion of a trip through the People's Republic of China.

In his own words, this was his first trip during three-and-a-half years in office as head of a delegation with predominantly economic orientation, consisting of eminent representatives of industry, science and agriculture from Schleswig-Holstein. The minister-president saw himself as a "door opener" on this trip to the People's Republic because, he said, "90 percent of the firms do not get to see the people who are presented to a political delegation."

The increased activities of state chiefs in the foreign trade area can be seen by the fact that the partnership agreements concluded by Schleswig-Holstein in China with the east Chinese coastal province of Zhejiang are being followed by a number of similar agreements with other German states.

Minister-president Barschel and his delegation found that German economic interests in the People's Republic encounter the direct competition of the Japanese, China's largest trade partner. Barschel thinks: "The Chinese complain to Tokyo that the Japanese are only interested in their own exports. We, on the other hand, emphasized that China's export capability is also to be increased. We want to build up the market in the long term. The Chinese only have to push a button in order to cut down Japanese imports. Japan will find that, in the long term, overly aggressive sales tactics will not necessarily pay off anywhere in the world, including China."

Increased Autonomy Favors Cooperation

As to the political part of his talks in China, Barschel has become convinced that the economic reform course will be continued, and that in the foreign policy area the Chinese leadership takes great care not "to be misinterpreted" by either side--neither by the United States nor by the Soviets. China does not want to become too dependent on either side.

According to Barschel, official Chinese authorities themselves expressed the desire to cooperate on a regional level between Chinese provinces and German states. The minister-president noticed in China that cities and provinces, and the agricultural enterprises and industries operating there, now have a greater measure of autonomy. They not only have new freedoms in their political contacts, but can also independently conclude agreements with foreign countries regarding agricultural and industrial projects as well as developments in infrastructure.

Zhejiang province, situated near Shanghai, recommended itself for cooperation with the northern German state above all because of its proximity to the coast and its agricultural structure. According to Barschel, many projects were discussed where German industrial participation is possible. Among them, he mentioned construction of Wenzhou harbor and the purchase, desired by the province, of used freighters, transport and passenger ships (in the latter case, they are already preparing financing models with the help of the Landesbank).

On their wish list is also an agricultural "demonstration project" for raising pigs by Nordfleisch (Raiffeisen group), and prospects in the textile sector, for example help in designing Chinese silk products. Schleswig-Holstein (through the Luebeck and Kiel universities) offers training for Chinese students and trainees as part of the partnership agreement. Barschel to the HANDELSBLATT: "They only have to know German so that the training can proceed without delay." This will bring about 100 Chinese to the north of Germany.

BEIJING TECHNOLOGY IMPORT STATISTICS REPORTED

Beijing BEIJING KEJIBAO in Chinese 26 Feb 86 p 1

[Report by Chen Zhiqiang [7115 1807 1730]: "Technology Importation In This City Is Developing Rapidly"]

[Text] Reporters have learned from the technology transformation working conference held recently in Beijing that the scale and depth of technology importation in this city in 1985 once again had new development. A total of 325 deals were reached with foreign interests for a total financial volume of $320 million. This surpassed that of 1984, which had been the highest volume in history. At the same time, this city also won seven support projects from the United Nations development support office, for a total volume of $9.8 million.

Last year, among the 325 technology importation projects in this city, 149 (45.8 percent) involved standards of the 1980's and 176 (54.2 percent) involved standards of the 1970's. For example, among those with advanced standards were intelligent instrumentation technology, helium-neon laser devices, nuclear magnetic resonance spectrometers, graphics facsimile machines, optic fiber production equipment, and optic fiber external waveguide production technology.

Among technology importation work in this city last year, the focus was on complete sets of equipment for the goal of domestic production. Fourteen projects (total transaction amount of $15.45 million) were contracted for by the municipal broadcast television industry general companies and 9 projects were key components in manufacture technology imported for the domestic production of color televisions (a total transaction volume of $13.24 million), which accounted for 85 percent of the total volume. To better improve the domestic production process for refrigerators and washing machines, this city imported temperature controller and evaporator manufacturing technology, as well as equipment for washing machine plastic injection molding.

Among the technologies imported last year, this city continued to stress support of industries of preferential development. There were 35 transactions regarding food product transactions (total transactions of $35.18 million), 11 percent of the total transactions. There were 41 projects for the electronics and precision instrumentation industries at $47.73 million, or 14.9 percent. There was a great increase in transactions for the building materials industry, contracting for 18 projects altogether for $26.26 million, or 8.2 percent. This was double that of last year. There were 96 projects for the textile industry (a volume of $60.36 million) for 18.8 percent. The motor vehicle industry had 18 projects for $19.09 million and 6 percent. At the same time, attention was also paid to arranging for technology importation for the raw materials industries.

LABOR AND WAGES

UNIONS GAIN IN ESTABLISHING 'WORKERS HOMES'

HK020735 Beijing CHINA DAILY in English 2 May 86 p 4

[Article by Zhang Xiaogang]

[Text] Chinese trade unions have made headway in turning their grassroots organizations ino "workers' homes," and promoting workers participation in the decision-making processes of enterprises and their welfare.

The All-China Federation of Trade Unions claimed before the 100th anniversary of May Day that almost half of Chinese enterprise unions had met its criteria government "workers' homes."

The "workers' home" programme was launched by the federation in May 1984, when it received workers' complaints that some union organizations had virtually become extensions of administration or enterprise management, and failed to help workers solve their problems.

The federation regarded this phenomenon as part of the legacy of the long-prevalent, ultra-leftist thinking of trade unions' role. It discussed the issue with the Central Secretariat of the Communist Party, and also reviewed the experience of unionists in other countries.

It decided that the workers must have a stronger voice in deciding enterprise affairs. This is what is now called enterprise democracy, or enterprise democratic management.

It likewise decided that unions should also help boost production along with enterprise management and publicize the Communist Party's decisions along with the Party propaganda department.

The unions should unite workers, support enterprise democracy, and help them whenever they need help.

These have proved to be fairly important decisions, a turning point where Chinese workers bid farewell to the "cultural revolution"-type unions, and began to think of ways to play their role in managing development and promoting their own interests.

Chinese union theorists argued that, in a socialist system, the union was still a necessary product of society's "economic relations," as it was in a capitalist system.

The problem that the union is most frequently faced with is how to balance the interests of the State, the enterprise or collective, and individual workers, they believed. And the union must join the Communist Party and the state to co-ordinate such affairs.

Disputes over working conditions would still now and then occur in China. Bureaucratism, sometimes being criminal itself, would erode workers' economic interests. Trade unions should speak for the workers and hold an effective check on this problem, according to an article recently published in WORKERS' DAILY.

Luo Gan, vice-chairman of the All-China Federation of Trade Unions, also pointed out that at present, one "glaring problem" was the lack of mass supervision on the distribution of wages, bonuses, and welfare.

In Shanghai, where a substantial proportion of the 10 million population belongs to industry and other kinds of businesses, trade unions have been active in promoting adult education and training of skilled workers.

The Shanghai unions are also contributing to the expansion of the metropolis' kindergarten system, since 55,000 more children between the ages of four and six are expected later this year.

The trade union of the Silao Valley Coal Mine in Shanxi Province sends its activists to visit workers' homes on weekends to "look for problems," and render prompt help.

These are good examples. The Chinese union activists regret that "workers' homes" still do not exist in more than half of Chinese enterprises. Therefore, they have to try hard to improve their work and strengthen their ties with the working masses.

The National Organizational Work Conference of Trade Unions, which closed last month, swore to make all the enterprise unions "workers' homes" before the end of 1987, or to accomplish the last half of the work in another 2 years.

The federation has also noticed that, with the expansion of industry, and other businesses and services at the county level, especially in formerly agrarian areas, county unions are gaining more and more members.

The conference marked the beginning of society's realization of the importance of county unions. The responsible people of the federation have reported that they are thinking of ways to strengthen county unions.

In an ambitious commentary in WORKERS' DAILY, the mouthpiece of the All-China Federation of Trade Unions, it was said that even unions at the county or city level should gradually meet the standards of "workers' homes."

The commentary called on the Communist Party and the government offices to co-operate with the unionists' efforts.

In a Chinese enterprise, there is another organization called the "workers congress." It is where workers discuss the managerial affairs of the enterprise.

INDUSTRY, COMMERCE FEDERATION HOLDS CONFERENCE

OW010514 Beijing XINHUA in English 0257 GMT 1 May 86

[Text] Changsha, May 1 (XINHUA)--The China Federation of Industry and Commerce has set up more than 1,000 industrial, commercial and service enterprises throughout China since 1979, according to the National Work Conference of the federation here.

The enterprises have created job opportunities for about 100,000 young school graduates and delivered to the state 120 million yuan in profits and taxes.

The federation was established by former industrialists and businessmen, who are good at business management and traditional industrial skills.

Huang Liangchen, vice-president of the federation, told the meeting that the federation's efforts have received full support and encouragement from the party and government. Facts show that in running enterprises, the federation can better contribute to the nation's modernization effort, he said.

The federation has also developed close ties with their counterparts in Hong Kong and Macao and among overseas Chinese, the vice-president said.

Over 200 responsible members of the federation and leaders of the federation's enterprises attended the conference.

BRIEFS

WORKFORCE NEARLY DOUBLES--Beijing, 29 April (XINHUA)--China's industrial workers number more than 120 million, nearly twice as many as the figure 15 years ago, according to the statistics bureau here today. The country's workers have been increasing at an annual rate of four million since the 1970s, said the bureau. Meanwhile, with the development of the country, the quality of the workers has also improved. The bureau said, for example, high-school graduates are common among workers nowadays, while there were few of them 15 years ago. It noted that approximately 20 million workers are presently taking television college courses or courses at sparetime or continuation schools. The increase is partly due to China's development of self-employed workers and workers in rural enterprises in recent years. Self-employed workers have increased from 800,000 in 1980 to 4.5 million by the end of last year and 60 million peasants have been employed by local rural industrial enterprises, according to the bureau. [Text] [Beijing XINHUA in English 1625 GMT 29 Apr 86] /12640

SERVICE COMPANIES HELP EMPLOYMENT--Beijing, May 5 (XINHUA)--China had more than 45,000 service companies employing six million people at the end of last year, a national meeting on employment being held here was told. Most of the companies, which run shops, restaurants, repair businesses and other service trades, were set up by county or township authorities. They provided jobs for urban workers and surplus labor from the countryside, an employment official told the meeting. The number of employees was 12.2 percent higher than at the end of 1984. The companies' total output value and sales increased by about 40 percent, and profits by more than 50 percent. Meanwhile, the companies also built more than 1,200 training centers. About 60,000 people are now being trained in these centers every year. [Text] [Beijing XINHUA in English 1532 GMT 5 May 86] /8309

NINGXIA RELIGIOUS LEADERS PROMOTE FAMILY PLANNING

OW031746 Beijing XINHUA in English 1454 GMT 3 May 86

[Text] Yinchuan, 3 May (XINHUA) -- "As leaders of the Islamic religion, we should and can help make China's family planning a success."

So said by Ma Chengcai, vice-chairman of the Islamic Society of the Ningxia Hui Autonomous Region, in an interview with XINHUA today. Ningxia is the only provincial-level administrative area in China where the Islamic Huis exercise self-government.

Ma said that Moslem Holymen have succeeded in convincing many believers of the need to control the population growth by quoting the Koran and other Islamic classics.

"The Koran does not oppose family planning," said Ma. "One teaching goes: in order (for the wife) not to suffer the pains of labor, it is permissible for the husband and wife to live separately or for the wife to have an abortion, with the couple's mutual consent."

"Another teaching says that separation of the husband and wife is allowed in order not to have babies," he added.

In addition to publicizing these teaching at religious services, he said, religious leaders have compiled pamphlets on population-control experience in Paikstan, Bangladesh, Egypt and other Islamic countries for their Moslems.

"But the best way of persuading people to accept the family planning policy is to convince them that to have fewer children does good to themselves," he said.

Ma cited the example of his native place, Tongxin County, where the population had grown nearly six times to 332,000 by 1985, up from 41,000 in 1949. "Despite increases in production, there has been little improvement in living standards," he said.

"More and more Muslims have come to realize that although the family planning policy for the Huis is much more liberal than that for the Han

Chinese, there is still the need for them to have fewer children for the benefits of their nationality," he said.

In Ningxia, the Han people in cities can have only one child per couple, and in rural areas, a maximum of two. But the Hui and other ethnic minorities can have two in cities and three in rural areas.

Many religious leaders have set personal examples of following the family planning policy.

Ma's daughter, who lives in Tongxin County, agreed to be sterilized after she had three children, and now 133 fellow women in the county have managed to persuade family members to have similar operations.

Following their examples, Ma said, 78 percent of the married women there now use contraceptives.

Earlier this year, the regional government called a meeting celebrating its success in bringing the region's natural population growth rate between 1981 abd 1985 down to 13 percent, 4.2 percent less than expected.

SURVEY SHOWS LOW DIVORCE RATE

OW281320 Beijing XINHUA in English 1255 GMT 28 Apr 86

[Text] Beijing, 28 April (XINHUA)--China's divorce rate ranges from 0.1 to 0.4 percent, much lower than that of many developed countries, the state statistical bureau reported today.

The figure is from a survey carried out last year among 13,000 married women under 50 in Hebei, Shaanxi, and Shanghai. Ninety-nine percent of these women had married before their 35th birthday.

Hebei was chosen as a coastal province, Shaanxi as an inland one, and Shanghai as a big city, explained a bureau official.

The divorce rate was 0.1 percent for Hebei, 0.3 percent for Shaanxi, and 0.4 percent for Shanghai, according to the survey.

Early marriage, which was popular in old China, is now rare in cities like Shanghai.

However, in Shaanxi Province, about 20 percent of women in the age group between 20 and 40 had married before they were 20, which is the legal minimum age of marriage for women.

And most of the women who had married early lived in the countryside, the bureau reported.

The survey showed that each couple had an average of 1.54 children in Shanghai, 2.45 in Hebei and 2.8 in Shaanxi.

Among the married women, 82.8 percent in Shanghai, 75.6 percent in Hebei and 59 percent in Shaaxni used contraceptives.

Infant mortality had fallen sharply. Mortality was about 19 per thousand in Shanghai and 34 per thousand in Hebei and Shaanxi Provinces.

ELDERLY WITHOUT CHILDREN IN SPECIAL HOMES

OW161426 Beijing XINHUA in English 1332 GMT 16 May 86

[New feature: "Reform Presents Problems and Hope for Elderly People Without Children"--XINHUA headline]

[Text] Harbin, 16 May (XINHUA)--China's responsibility system ties farmers' income to their output in the fields, and a few years ago, when farmers in Heilongjiang Province were told the system would come to their area, they embraced it warmly, hoping for new prosperity, and for some, it has begun to arrive.

Some of the people the Chinese revere most--the elderly--had worries.

Elderly people with children are as well cared for as ever, but with income tied to output, those too old to work in the fields and without relatives to depend on could have a rough time.

Local governments have responded quickly. By the end of April, 97 percent of the rural towns in the area of Qiqihar City in Heilongjiang, China's northernmost province, had set up 187 special homes for the childless old.

Nearly 5,000 people are being cared for in these homes, and they are finding that the responsibility system can work for them--the wages of the nurses at the homes are tied by their administrators to the quality of care they provide the patients.

Authorities in the area launched a fund drive last year to help the childless elderly. They raised three million yuan from organizations and individuals and, with the money, were able to build or expand 71 homes.

By October, each of the area's 200 rural towns is expected to have at least one home for the elderly, according to an official of Qiqihar, which supervises the rural towns on its outskirts.

To support the homes, nurses have initiated such sidelines as growing vegetables and raising pigs. Last year their efforts generated 1.2 million yuan, the official said.

As a result, he said, most of the homes have become self-sufficient in terms of meat and vegetables, and many have bought color televisions and washing machines.

BRIEFS

FUND FOR AGED--Beijing, 14 May (XINHUA)--A national fund to help China's 80 million old people was launched at a meeting here today. Wang Shoudao, vice-chairman of the National Committee of the Chinese People's Political Consultative Conference, was elected honorary director-in-chief of the fund, and Yu Guanghan, chairman of the Chinese National Committee on Aging, director-in-chief. As a mass organization, the fund will raise money from government departments, enterprises, or individuals to build centers and support welfare services for old folk, and will liaise with overseas Chinese and foreign organizations for the aged. China's population of 80 million people above the age of 60 is expected to grow to 130 million by the end of the century. To enable the elderly to lead a richer life, the Government has taken and backed measures in recent years to set up special colleges and recreational centers for them. TRANSPORTATION

SIXTH FIVE-YEAR PLAN TRANSPORTATION SUCCESSES OUTLINED

Hong Kong CHING-CHI TAO-PAO in Chinese 24 Mar 86 pp 28-29

[Article by Ch'en I-gen [7115 0076 2704]: "New Situation in Process of Forming in China's Transportation"]

[Text] Transportation must take the lead in an economic take-off. In its recommendations for the Seventh 5-Year Plan for national economic and social development in September 1985, the CPC Central Committee particularly stressed adherence to a priority position for transportation and communications. During the Seventh 5-Year Plan, major efforts are to be made to bolster highway, water, and air transportation, to change the transportation mix, and to promote the modernization of transportation.

Right after the lunar New Year, a national conference on transportation work convened in Beijing. During this conference, the correspondent interviewed Minister of Communications Qian Yongchang [6929 3057 2490], asking him to provide a detailed briefing on developments and prospects in China's transportation.

One of the Best Periods for Transportation

Minister Qian said that the Sixth 5-Year Plan period had been one of the best for transportation since the founding of the Chinese People's Republic. Sixth 5-Year Plan goals for volume of highway freight hauled had been fulfilled 1 year ahead of schedule. During 1985, 651 million tons of freight had been hauled on highways 21 percent more than in 1980. Passengers transported numbered 4.2 billion, up 87.5 percent from 1980 in a 13.6 percent annual increase. Volume of ship cargo hauled reached more than 480 million tons in a 23 percent increase over 1980. Major coastal ports completed 1 year ahead of schedule their Sixth 5-Year Plan quotas for volume of cargo handled. In 1985, they handled more than 350 million tons, up 62 percent from 1980 for an average annual 10.1 percent increase. This included the port of Shanghai's breaking of the 100 million ton mark in volume of cargo handled during the last 2 years of the Sixth 5-Year Plan to enter the world ranks of ports handling 100 million tons. Despite a slump in the international marine transportation market, a glut of transportation and fierce competition, the China Ocean Shipping Company worked to develop and strove to improve its operation in the midst of competition, both the volume it hauled and its economic effectiveness rising year after year beginning in 1984. Its freight volume was 15 percent higher in 1984 than in 1983, and in 1985 it again increased volume by 17.5 percent over 1984.

Rapid Construction of Basic Facilities

On the topic of construction of basic facilities for transportation, Minister Qian said that speed of construction had been greater during the Sixth 5-Year Plan period than at any time during the previous 36 years. In port construction, during the 5 year period a total of 54 deep water anchorages and 25 medium deep water anchorages had been built, increasing cargo handling capacity by more than 100 million tons. As of the end of 1985, deep water anchorages in the country's major coastal ports numbered 199; medium deep water anchorages numbered 156, and cargo handling capacity was 317 million tons. During the past 5 years, new developments had also taken place in the building of piers by cargo owners themselves, through local pooling of funds and joint development, and use of foreign capital. In 1985 alone, materials departments in Hubei Province had built 32 pier anchorages with a cargo handling capacity of more than 2 million tons. In the realm of construction on inland rivers, emphasis on the main Chang Jiang route had been on improvement of ports along the way and on the construction in the river's lower reaches of a number of foreign trade piers. Dredging of the 400 kilometer long Grand Canal running between Beijing and Hangzhou has been completed, and projects for the construction of two-way boat locks are underway. In Guangzhou, 52,000 kilometers of highway were constructed during the Fifth 5-Year Plan, and 83,000 kilometers of highways were surfaced. Fifteen thousand bridges of various kinds were constructed. As of the end of 1985, the country had 940,000 kilometers of highways, including more than 193,000 kilometers of primary and secondary highways. The first class highway for the dispersal of cargo at Tianjin, the highway in China that has the highest standards, was completed in October 1985. It is capable of handling 20,000 motor vehicles in a 24 hour period. The more than 1,900-kilometer long Qinghai-Xizang Highway has undergone renovation, with an asphalt surface applied throughout its length for a more than doubling of its traffic carrying capacity.

Simultaneous Existence of Multiple Economic Entities

During the Sixth 5-Year Plan, political and entrepreneurial responsibilities were separated in transportation units, and very great achievements were also scored in the simplification of political institutions and the delegation of authority. Both the ministry and transportation departments (or bureaus) in all provinces and regions delegated authority to a number of directly subordinate enterprises. Delegation of authority has been made at Tianjin and Dalian ports, both of which are under direct jurisdiction of the ministry, and the port of Shanghai has recently begun to delegate authority to cities woncerned. A delegation of authority is being gradually carried out in navigation of the Chang Jiang following a separation of the administration of the port and navigation.

Qian Yongchang said that during the Sixth 5-Year Plan the country's principle economic form for transportation had been undiversified public ownership. As a result of several years of reform, however, a situation of independent management and independent operation has come about as a result of fundamental changes in transportation production and construction, with multiple units conducting operations, many quarters pooling capital, and many economic entities existing side by side for a thriving situation. As of the end of 1985, there were 290,000 independently owned motor vehicles engaged in transportation throughout the country, which was more than the number in the hands of units specializing in transportation. There were more than 240,000 independently owned ships with a capacity of 3.2 million tons engaged in transportation. This was approximately two-thirds the number of state-owned and collectively owned ships engaged in inland river transportation. There are currently 73 outfits engaged in marine transportation. More than 800 shipping companies are now a part of the Chang Jiang water system, and volume of cargo hauled on this system increased by 10 million tons annually. The volume of foreign trade cargo handled by Chang Jiang ports in 1985 reached 5.95 million tons, which was double the 1984 amount.

Minister Qian Yongchang said that in the realm of highway transportation, the country had established jointly managed organizations including the Northeast Highway Containerized Cargo Joint Transportation Main Station and the Beijing-Shanghai Containerized Cargo Transfer Center. There are more than 2,500 routes throughout the country for the hauling of odd lots of freight. One is the East China Highway Transportation network centering around Shanghai, and another is a highway transportation network centering around Beijing and Shenyang that links eight provinces in north and northeast China.

Acceleration of Progress and Improvement of Quality

Speaking about development plans for transportation in China during the Seventh 5-Year Plan, Minister Qian Yongchang said this matter has two aspects. One is a firm grip on the building of basic transportation facilities. The second is the bolstering of management and improvement of macroeconomic controls.

Minister Qian said that basic needs in the building of transportation facilities during the Seventh 5-Year Plan are as follows: First is hastening of construction progress insofar as the country's financial and material resources permit. Second is improvement in the quality of basic facilities with the construction of a number of ports and highways that meet fairly high standards, plus improvement of inland river transportation facilities. Third is improvement of the mix and the pattern of basic facilities to improve overall performance. Fourth is to meet the urgent needs of the present and lay a definite foundation for economic take-off during the next 10 years.

Specifically recommended during the Seventh 5-Year Plan is the building and coming on stream of 100 deep water anchorages, with efforts to build 120, and the building and coming on stream of 80 medium and small anchorages. The number of deep water anchorages built and put into service should be more than double the Sixth 5-Year Plan number. With the completion of this construction, the adaptability of China's ports will increase markedly. First the back-up of ships and the port congestion will certainly be ameliorated. By the end of the Seventh 5-Year Plan, China's coastal ports will have approximately 1,200 anchorages, between 300 and 320 of them deep water anchorages. Preliminary estimates have been prepared on the ratio of anchorages to ships in port, which is roughly 1 to 2. Second is the hauling of principal port supplies such as handling capacity for coal, crude oil, ores, grain, and timber, which will be substantially commensurate. There will be a general dovetailing of the movement of such cargoes with the hauling capacity of railroads and pipelines, and the matching of ship loading and unloading with the marine coal hauling system and the water-borne crude oil movement system. Third is improvement in port modernization to make more rational the structure and layout of ports for substantial improvement in port loading and unloading facilities and the availability of highway transportation to disperse port cargoes.

Emphasis in highway construction during the Seventh 5-Year Plan will be on new construction, rebuilding and expansion of main economic arteries, lines to disperse cargoes from ports, energy lines and major tourist lines. The Ministry of Communications' initial planning has been done for 27 routes, including the routes between Beijing and Tanggu, Beijing and Shenyang, Shenyang and Dalian, Shanghai and Nanjing, Shanghai and Hangzhou, Nanjing and Hangzhou, Fuzhou and Xiamen, Nanning and Beihai, Jinan and Qingdao, and Guangzhou and Zhuhai, constructing highways totaling 8,500 kilometers in length.

With the completion of this planned construction, China's highway situation will have undergone the following changes: First is moderation to a certain extent of congestion at points of entry and exit at large cities, on dispersal routes to and from port and station hubs, and at choke points on major trunk lines. Second is a proper rise in grade standards for China's highways, and the building of China's first high speed highways.

Raising of Funds Through Many Channels and Vigorous Efforts To Attract Foreign Capital

The emphasis in construction on inland rivers is mostly on five rivers. On the main Chang Jiang artery, the emphasis is on the building of ports, mostly a transformation of the old piers. This transformation is intended to expand capacity by 9.67 million tons, including 5 million tons of coal ship loading capacity. Foreign trade piers are to be built at Wuhan, Huangshi, and Wuhu where eight new 5,000 ton anchorages with a capacity of 2.5 million tons will be built. Feasibility studies will be prepared for shipping lanes on 16 tributaries to the Chang Jiang water system in order to develop them when conditions are right.

Qian Yongchang said that good construction of basic transportation facilities entails, first of all, the planning of transportation patterns. Investment in construction has to be focused; it cannot be spread too thinly. It is necessary to stir enthusiasm in all quarters, to raise funds through various channels, and to make special efforts and act courageously to attract foreign capital for use in the construction of basic transportation facilities.

Application of Three Methods and Institution of Macro-control

Qian Yongchang said that intensification of macro-control of transportation is required. In its recommendations for the Seventh 5-Year Plan, the CPC Central Committee pointed out that state management of enterprises would gradually move away from mostly direct control to mostly indirect control, and that emphasis should be on macroscopic strengthening of indirect control over economic activity.

Qian Yongchang said that institution of macro-control would be done mostly through the application of three methods, as follows:

First would be economic methods. This consisted mostly of the regulatory role of economic levers such as the use of shipping prices, payment of taxes and profits, credit, interest rates, and depreciation.

Second would be legal methods. It is necessary to amplify laws governing transportation and to perfect various laws, regulations and ordinances having to do with transportation as well as corresponding provisions for carrying them out.

Third would be administrative methods. Until such time as economic methods and legal methods have been perfected, administrative methods will have to be used against units and individuals that refuse to take the whole situation into account but only show concern for a part of it, or refuse to take a long-range view but show concern only for the present and seek out loopholes in reforms. Administrative methods, economic methods, and legal methods are mutually reinforcing and complementary. The direction of reform should be gradual reduction in the use of administrative methods; however, it will never be possible to dispense entirely with necessary administrative methods. It is necessary to buttress programs and policies constantly, to audit and to supervise, to administer highway and aviation policies, to reduce gradually plans of a directive nature, to expand plans of a guidance nature, and to regulate markets properly.

A 1,000 mile journey begins with the first step. Qian Yongchang said that among the tasks that transportation units must complete this year are completion of the shipment by water of 180 million tons of freight, and fulfillment of a 340-million ton quota of cargo handled by coastal ports.

Formulation of a number of basic laws. Five laws have been submitted to the State Council including: "The Marine Commerce Law," "Shipping Regulations," and "Contract Regulations For Highway Freight Transportation." Plans call for the drafting this year of "Harbor Law" and "Regulations on Handling of Highway Accidents."

A firm grip should be taken on improvement of transportation techniques, basically maintaining the level of 1985. The main emphasis of the technical transformation of ports should be on transformation of coastal areas that have technically backward equipment, pier anchorages on inland rivers, expansion of warehousing, and improvement of the availability of transportation to move cargoes from hub areas.

TRANSPORTATION

DOUBLE TRACKING OF HARBIN-SUIFENHE RAILWAY

Beijing TIEDAO ZHISHI in Chinese No 1, 28 Jan 86 pp 2-3

[Article by Jiang Chenglu [1203 2052 0712]: "The Harbin-Suifenhe Railway, Which Is In Process of Being Double Tracked"]

[Excerpt] The Harbin-Suifenhe Railway, which traverses the southeastern part of Heilongjiang Province, has as its principal responsibility the hauling of coal from the coal producing area in the eastern part of the province. Inasmuch as the single track line is no longer able to satisfy ever increasing requirements for the hauling of coal from the region, the country has decided to double track this line between Harbin and Mudanjiang.

Geographical Position

The Harbin-Suifenhe Railroad begins at Harbin, the capital of Heilongjiang Province, and travels eastward through Mudanjiang to Suifenhe on the Sino-Soviet border, covering a distance of 546.4 kilometers. The Harbin-Suifenhe Railroad intersects at the Harbin hub with the Harbin-Dalian, the Harbin-Jiamusi and the Harbin-Manzhouli lines. At the Mudanjiang hub, it connects with the Mudanjiang-Tumen and the Mudanjiang-Jiamusi lines, and it links Linkou, Qitaihe, Jixi, and Hengshan, major coal producing areas of Heilongjiang Province. Between Mudanjiang and Suifenhe, the line connecting Jixi with Xiachengzi intersects it, providing yet another artery forbonds, is a Chinese border city, and the Suifenhe station is yet another entry and exit point for land trade between China and the USSR.

The Harbin-Suifenhe Railroad is a major transportation artery running in an east-west direction in the northern part of northeastern China. It is a major trunk line in China's railroad network, and a transportation route for international trade between China and the Soviet Union and between China and Korea. It is also the nearest route for the movement of coal from the eastern part of Heilongjiang Province to the industrial area of Liaoning Province. Double tracking of the Harbin-Suifenhe Railroad holds major significance for further development of the economy of the northeastern region and for ameliorating the energy shortage in the southern part of Liaoning Province.

Principal Ingredients in the Double Tracking

The operating distance between Harbin and Mudanjiang on the Harbin-Suifenhe Railroad is 337 kilometers. Between 1958 and 1962 a 152 kilometer stretch through a total of 17 sections including the sections from Xinxiangfang to Xiaoling, Maoershan to Laoshan, Yimianbo to Jiujiangpao, Zhishan to Qifeng, and Aotou to Lagu were double tracked and opened to traffic. Now the double tracking of all remaining single track sections is to be completed, covering a length of 185 kilometers.

Existing equipment on the Harbin-Suifenhe line is antiquated and standards are low. The section of the line between Harbin and Yuquan is still fairly flat and straight, but after leaving Yuquan, the line enters the Zhangguangcai mountain region where grades are steep and the radius of curves is small. The maximum grade is 1.2 percent and the minimum curve radius is 250 meters. In two sections that cross the mountains, with a distance of 106 kilometers, two locomotives must be used to pull.

During the present double tracking, standards will be raised both for equipment and for renovations. For example, the minimum curve radius will be altered to 400 meters, and the grade limit for single engines will be changed to .53 percent. In the direction traveled by two locomotives with loaded cars, it will be changed to 1.13 percent Fairly long arrival and departure lines will be lengthened to 850 meters; signals will be altered to the relay semi-automatic blocking kind. Interlocking will be all electric for large, medium, and small stations. Communications and electric power are to be improved and strengthened. As passenger and freight traffic volume increase along the line and as the amount of technical operations mount, sidings will be increased at most stations. New stations will be built and a corresponding number of passenger and freight transportation facilities will be added. In order to lower project costs and hasten the pace of construction, every effort will be made to use old double track roadbeds, bridges, and culverts in doing the new double tracking. In order to avoid excessive increase in the amount of work required and investment that would result from the lowering of gradients, two locomotives will continue to be used to pull trains across the two sections that traverse the mountains. Except for required changes in grade crossings and vertical sections on existing lines resulting from the rebuilding of station areas, in order to reduce major changes in or major abandonment of existing lines, generally no major changes will be made to other sections including curves with a radius of less than 400 meters, straight and narrow lines that do not meet standards, and gentle curves.

After the section between Harbin and Mudanjiang has been built, its annual traffic capacity will be substantially increased to 22 million tons up the line and 13 million tons down the line. This will substantially satisfy near-term needs for an increase in traffic volume. Over the long-term, as the volume of traffic increases, automatic blocking will be instituted along the entire line.

During the period of double tracking, the Mudanjiang hub will also be expanded. After the expansion, total freight volume can increase to 35 million tons per year. The Mudanjiang passenger station will also be expanded at the same time, and the newly built facilities will be complete in every way. The station will be able to hold a maximum of 3,500 people at once time.

Work began in 1982 on the Harbin-Mudanjiang double tracking project and on expansion of the Mudanjiang hub. It will be completed before 1990.

Products Found Along the Line

Industry is well developed and products proliferate along the Harbin-Suifenhe Railroad line. The western section of the line is located in the major grain growing region of northeast China, the Songhuajiang Plain, which produces huge amounts of soybeans, corn, wheat, sorghum, and light industrial raw materials such as sugarbeets, flax, and flue-cured tobacco. Industries include sugar refining, linen textiles, brewing, and leather processing for the most part. Examples are the sugar refineries and flax plants at Acheng, the breweries at Yuquan and Yimianbo, the products from which are sold throughout the country. In the central section that crosses the Zhangguangcai mountain range, large amounts of timber, mineral construction materials and local specialties such as ginseng, wood fungus, mushrooms and hazel nuts are produced. The eastern section of the line abuts a coal region with abundant coal reserves of good quality that are not far below the surface, making for easy extraction. In addition to large coal mine areas such as Jixi and Qitaihe, during the past 2 years some local small coal mines have been newly opened with an annual output totaling more than 30 million tons. Some of this coal travels via the Harbin-Suifenhe Railroad to energy-short areas in southern Liaoning Province. Another portion of it goes via the Mudanjiang-Tumen line for export. In the eastern section, not only are there coal resources, but forest resources are very abundant as well. In the Dongfanghong region at Hailin, Chaihe, Suiyang, and beyond Mudanjiang lies a major timber producing area. Mudanjiang is a new industrial city with rubber, farm machinery, oil refining, timber processing, cement, and paper making industries.

PUBLICATIONS

BRIEFS

WEEKLY BEGINS PUBLICATION IN UK--CHINA ECONOMIC WEEKLY, a new publication, produced in English by the journal ECONOMIC DAILY, will come out on 1 May. The 16-page weekly will be edited in Beijing, and printed and distributed in Britain. A senior official from ECONOMIC DAILY said the weekly will mainly cover the economic principles and policies of the Chinese Government, and China's economic reform, regulations and economic activities. It will also cover China's economic, technical and cultural exchanges in cooperation with foreign countries and provide information on investment, cooperation and trade for foreign businessmen, he added. NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'EXCERPTS' OF SHANGHAI 1986 DEVELOPMENT PLAN

OW221400 Shanghai WEN HUI BAO in Chinese 6 May 86 pp 2, 4

[Text] Report on Shanghai's 1986 Plan for Economic and Social Development [excerpts]

[Delivered] at the Fifth Session of the Eighth Shanghai Municipal People's Congress on 25 April 1986

[By] Vice Mayor of Shanghai Municipality Li Zhaoji

1. Execution of the 1985 Plan

Nineteen eighty-five was the last year of the Sixth 5-Year Plan. Thanks to the concerted efforts and hard work of the people of the whole municipality in conscientiously implementing the report on the outline of the strategy for Shanghai's economic development, approved by the State Council, we made new advances in reform and opening to the outside world, scored better economic achievements than expected, fulfilled and overfulfilled the economic and social development plan, and successfully accomplished all major targets set in Shanghai's Sixth 5-Year Plan, thereby laying the groundwork for implementing the strategy for Shanghai's economic development. The gross product of the people of the municipality in 1985 was 46.7 billion yuan which, in terms of comparable prices, represented a 13.4 percent increase over the previous year. Following describes the fulfillment of the plan in various fields:

Industrial production maintained a sustained, steady, and balanced growth. The total industrial output value in 1985 was 82.96 billion yuan, topping 1984 by 11.4 percent and overfulfilling the planned increase of 8 percent. It was the biggest growth in the Sixth 5-Year Plan. Light and heavy industries developed in a harmonious manner, with light industry showing an increase of 11.8 percent and heavy industry, of 11 percent, over 1984. The proportion between light and heavy industry was 55.6 to 44.4. Except for crude salt and heavy oil, the 38 products under the state mandatory plan had their annual plan targets fulfilled.

The rural economy continued to advance in the course of reform. The annual agricultural output value (including village-run industry) totalled 5.59 billion yuan, 19.4 percent more than in 1984.

The market was brisk. Yearly retail sales reached 18.32 billion yuan, representing a more than 30 percent increase over the previous year. Supply of foodstuffs clothing, and consumer goods increased in an all-round manner, while sales of high-grade durable consumer goods registered even bigger increases. A tremendous change took place in residential consumption patterns. The proportion of sales of foodstuffs, clothing, and consumer goods as compared to the total retail sales was respectively 37, 20.5, and 41.9 percent, with sales of consumer goods surpassing those of foodstuffs for the first time since the founding of the country, reflecting a higher consumption level.

In transportation, passenger and freight transport plans were overfulfilled, with a total of 242 million metric tons of freight transported in 1985, or 4.7 percent more than in the previous year. However, transportation facilities were overloaded, ports crowded with ships, and warehouses overstocked with materials.

Construction of key projects and urban infrastructure proceeded at a faster pace. A total of 9.93 billion yuan of investment was made in fixed assets, an increase of 28.8 percent over 1984. Of this, 5.71 billion yuan was invested in capital construction, 20.3 percent more than in the previous year; 3.56 billion yuan in upgrading facilities, topping 1984 by 58 percent; and 670 million yuan in construction of rural towns and other projects, 7 percent less than in 1984. As a result of the faster construction pace of key projects and infrastructure, the construction of 12 key state projects proceeded smoothly. The municipality's investment in transportation, postal, telecommunications, electric power, public utility, and other infrastructural facilities during 1985 topped that of the previous year by 95.4 percent, with its proportion compared to the municipality's total investment rising from 13.9 percent in 1984 to 20.6 percent. The nine urban capital construction projects approved by the Third Session of the Eighth Municipal People's Congress last year were basically completed and put into production or operation.

New achievements were made in opening to the outside world and establishing ties with other areas of China. In 1985, with international market prices dropping, Shanghai's export ports handled U.S. $3.36 billion of export goods thanks to the efforts made by all sectors concerned. Although overfulfilling the state plan, this figure was still 6.3 percent less than in the previous year. In the same year, Shanghai signed 121 contracts with foreign countries and utilized U.S. $770 of foreign capital, 220 percent over the previous year, representing a faster rate in utlizing foreign capital. Shanghai signed 22 construction and labor service contracts involving U.S. $13 million. It received 600,000 foreign guests and tourists from 150 countries and areas, 13.2 percent over the previous year, generating a tourism income of 420 million yuan, 44.2 percent over the previous year. Regarding ties with other areas of the country, Shanghai formed over 2,000 economic associations with 28 provinces, municipalities, and autonomous regions as of 1985. These included enterprises with joint investment, joint production, compensatory trade, and so forth. There were over 1,500 cases of technical cooperation and technical transfer; many of them have yielded or are yielding good economic and social benefits, and over 200 million yuan in profit has been produced in 1985 alone.

More scientific, technological, and educational undertakings were developed. In 1985, Shanghai made 1,957 major scientific and technological achievements, 12.9 percent of them reaching the internatonal advanced level or being international firsts, and 73.5 of them matching the national advanced level or being firsts in the country. The rate of application and popularization of scientific research results increased from 52.6 percent in 1984 to 57.1 percent in 1985. Social science workers also made many research achievements, contributing to Shanghai's national economic and social development. The city enrolled a total of 4,347 postgraduate students, 37,000 students for regular colleges and universities, and 26,000 for secondary technical schools, all figures surpassing the planned targets. In 1985, a total of 1,580 postgraudate students completed their courses, 1,106 more than in the previous year. Among them, 57 were awarded doctcrate degrees and 1,371, masters degrees. In 1985, the larges number of postgraduate students were trained during the entire Sixth 5-Year Plan period. Adult education also developed vigorously. The combined enrollment of all types and levels of adult schools was 776,000, some 150,000 of the enrolled by institutes of higher education for adults.

Revenue and withdrawal of currency from circulation were good. In 1985, Shanghai's local revenue reached 18.09 billion yuan, 7.8 percent over the planned target and 12.7 percent over the previous year. Banks withdrew 3,208 million yuan net, 1.3 billion yuan over the planned target and 82.8 percent over the previous year, being the largest amount every withdrawn since the founding of the People's Republic.

The people's livelihood in both urban and rural areas further improved. The state arranged and assigned jobs for 161,000 people in Shanghai in 1985, and the total number of staff and workers by the end of the year was 4,926,000, some 51,000 more than in the previous year. Their total wages amounted to 6.55 billion yuan, 21.9 percent over the preceding year. Their average annual wage was 1,344 yuan. Adding the subsidies for increased prices of nonstaple foods and deducting the increases in price indexes, their actual income was 12.3 percent more than in the preceding year. Statistics showed that peasants' per-capita income was 714 yuan, 11.6 percent more than in the previous year. By the end of the year, urban and rural people's savings deposits totaled 7.01 billion yuan, 24.9 percent over the previous year.
